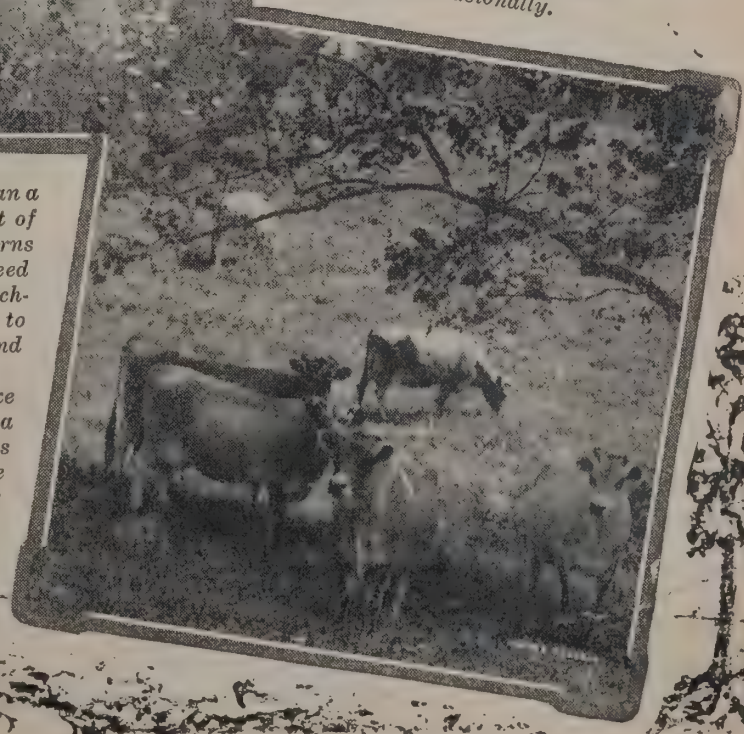
The Cow~The Pig~The Hen

This Combination Essential In Every Section For Farm Profits and the Proper Nourishment of the People

The cafeteria style of feeding is very acceptable to the pig. He is an animal that has no stomach troubles from overeating and like many people seem to enjoy eating between meals. The pig makes good use of a balanced diet and more than average returns depend on proper feeding and care.



There is pleasure and profit in raising a nice flock of chickens. Select some breed that you like and then feed and care for it in the proper way. All animals require good, clean houses and yards, but the chicken particularly requires good, sanitary quarters. Yards should be plowed occasionally.

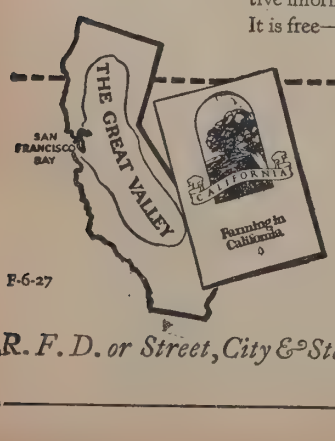
What better associates can a boy or girl have than that of live stock? A boy who learns how to take care of and feed live stock needs little coaching from his parents as to importance of work and right course in life.

How long does it take a chicken to weigh a pound? At five weeks old this chicken on the scale weighed nearly one pound.

You've had your share of HARD farming — *now come to California!*

THERE are thousands of farmers in California making as much money now from ten, twenty or forty acres as they used to make on big farms "back East." Many of them came from your own state—some, probably, from your own county. They have found that farming is easier here, and just as profitable. The hardships have been taken out of life for their families, too. They will never leave their sunny irrigated orchards and farms, their mountains and seashore, their snowless winters and clear summers for the harder farm life they used to know.

There are many opportunities here for you. California orchards and farms produce 180 different crops commercially. We count many of our fruit crops by millions of boxes and by hundreds of thousands of tons. Our hay crop is worth over $75,000,000 a year. We raise every year over forty million dollars worth of eggs and chickens—a quarter of them in one county near San Francisco and three-quarters of them in the Great Valley and neighboring valleys. Yet California still needs more all 'round farmers.



Farmers with dairy herds are getting cream checks 20% higher than the price on the average check throughout the country, and their cows give the highest average butterfat production in the United States. Dairying is economical in cost; cheap and plentiful electricity and fine roads make it easier; the winter shelter problem is a small one in a climate where cows graze on growing alfalfa all through the winter. The hogs we raise on the side find a high market because we still produce only 25% of our pork.

These are surprising facts about some of the items that make up California's $700,000,000 farm production. You can verify them by government and other official statistics, or by your own observation.

That is the best way—come out and see for yourself. It's a great vacation trip to San Francisco, the center of it all. Californians Inc., will be glad to tell you what to see, what to look out for and where you can find the farm and home you have in mind.

Low summer round-trip fares to California —$90.30 from Chicago for example.

Californians Inc., is a non-profit organization that has nothing to sell. Its members are thousands of business firms and citizens who are interested in developing the state's great resources by advertising them to capable, intelligent settlers with sufficient capital to make these opportunities pay. "Farming in California," an 84-page booklet of authoritative information, will tell you much that you want to know beforehand. It is free—simply clip and mail this coupon today.

How Much Milk In The Udde

W. L. GAINES, ILLINOIS

HOW much milk is present in the udder of a cow at the time the milker starts to milk? Some have contended that there is not room in the udder for the storage of more than a small quantity of milk and that therefore the most of it must be formed during the process of milking. This contention is based on the idea that all the milk present is stored in the milk cisterns.

That the whole udder may be filled with milk, like a fine sponge may be filled, is indicated by some experiments conducted by the Dairy Husbandry Department of the Illinois Experiment Station. The method of the experiment is based on the fact that milk contains an almost constant percentage of sugar. The per cent of sugar in cow's milk usually lies between 4.5 and 5.0 per cent. When one puts a heaping teaspoonful of sugar in a cup of coffee he has a drink containing about 5 per cent of sugar. Nature has seen fit to provide the calf

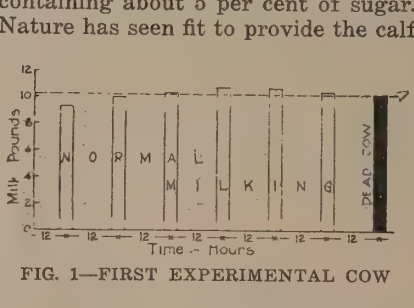

FIG. 1—FIRST EXPERIMENTAL COW

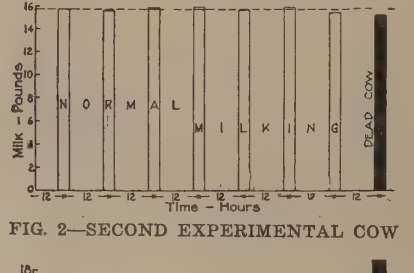

FIG. 2—SECOND EXPERIMENTAL COW

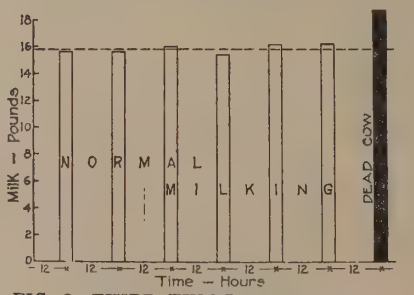

FIG. 3—THIRD EXPERIMENTAL COW

The cows in these experiments were milked at exact 12-hour intervals. The yield of milk at each milking is shown by the open columns. The average yields are shown by the broken horizontal lines at the tops of the charts. At the last regular milking hour the cows were killed without having been milked and the black columns show the amount of milk found in the udders of the dead cows.

with milk containing about 5 per cent of sugar. Although milk sugar, or lactose, is not as sweet to the taste as cane sugar, it serves the same purpose as a food. But the point of interest, so far as our experiment goes, is that there is a large amount of sugar in the milk and only a bare trace of sugar (glucose) in the blood and practically none at all in the solid tissues of the animal body. This makes it possible to determine the amount of milk in the udder of a dead cow by analyzing the whole organ for lactose. One could not use the protein or fat of the milk in the same way because the solid tissues of the udder contain much protein and fat.

The plan of the experiment then was to put a cow on a regular and sufficient ration, to milk her at uniform 12-hour intervals, to weigh and analyze the milk for lactose; and finally, at a regular milking time but without milking the cow, to kill her by the usual butcher's method of knocking in the head and bleeding. As soon as the cow was dead the u der was removed, taken to the labo tory and subjected to chemical ana sis.

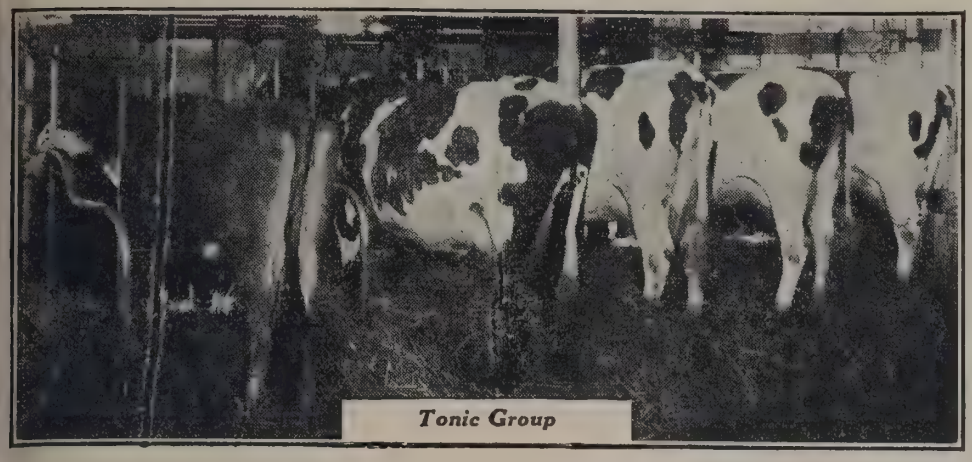
Three cows were used in all. T first cow was not milking very hea ly, about 20 pounds per day. T amount of lactose found in the ud was very slightly greater than the a erage amount present in the milk the six preceding milkings.

The procedure with the seco cow was similar to the first one cept that after cutting the ud away from the body it was suspend and milked. The amount of milk tained was 5.5 pounds, about 1-3 the average yield of the 7 precedi milkings. When the udder was slic up preparatory for grinding for an ysis an additional 5.0 pounds of mil fluid drained out, which proved to about 80 per cent pure milk and t rest was other body fluids includi a trace of blood. The drained ud tissues contained the equivalent of pounds of milk judging by t amount of milk sugar found. T total amount of milk found in t udder was equal to 96 per cent of t average yield of the 7 preceding mi ings.

The third cow was treated in t same way as the second cow. Mi ing the amputated udder gave pounds of milk, and from the slic udder there was obtained mil drainings of 6.0 pounds which aga appeared to be about 80 per cent pu milk. The drained udder tissue co tained an amount of milk sugar equ to 10.4 pounds of milk. The to amount of milk recovered was equ to 118 per cent of the average yie of the 6 preceding milkings.

These experiments show clearly th all the milk is present in the udder the time of milking and the stimul of milking is not necessary to t formation of the milk. The questi arises why the milk could not milked out of the udder of the de cow. The reason is that in the livi cow a nervous reflex is set up by t act of milking which results in a co traction of the fine milk ducts a forces the milk out into the milk c tern and teat where the milker c squeeze it out. In the dead anim this nervous reaction cannot ta place, and so only the small part the milk already present in the m cisterns and large ducts can be c tained by milking the amputat udder.

We often speak of a cow "holdi up" her milk. What this really mea is that for some reason the nervo reaction of milking does not proce in the usual or natural way and t milk is not forced out of the fi ducts, and consequently the milker unable to secure the full flow of mi Nervous reactions are always eas upset. Any excitement, alarm, or d comfort of the cow is apt to interfe with the nervous response concern in the milking process and thus i terfere with the regular and full yie of milk. The accumulation of mi in the udder tends to check the fu ther formation of milk. On this a count complete and thorough milki is necessary to secure the highe yield.

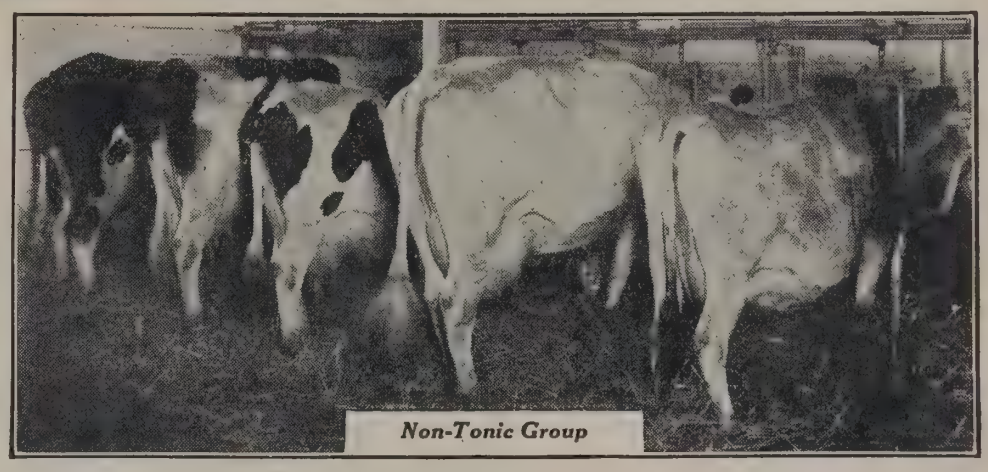


New York Class Leader

Wyebrook Merrymaid owned C. L. A. Whitney, New York, h just completed a junior two-year-o record which puts her eighth Class G. She produced 16,219.1 l milk, 761.7 lbs. fat, carrying a c 200 days of her record period.—T. American Guernsey Cattle Club.

BULLETIN

Weekly Milk Records on 10 Cows for 42 Weeks

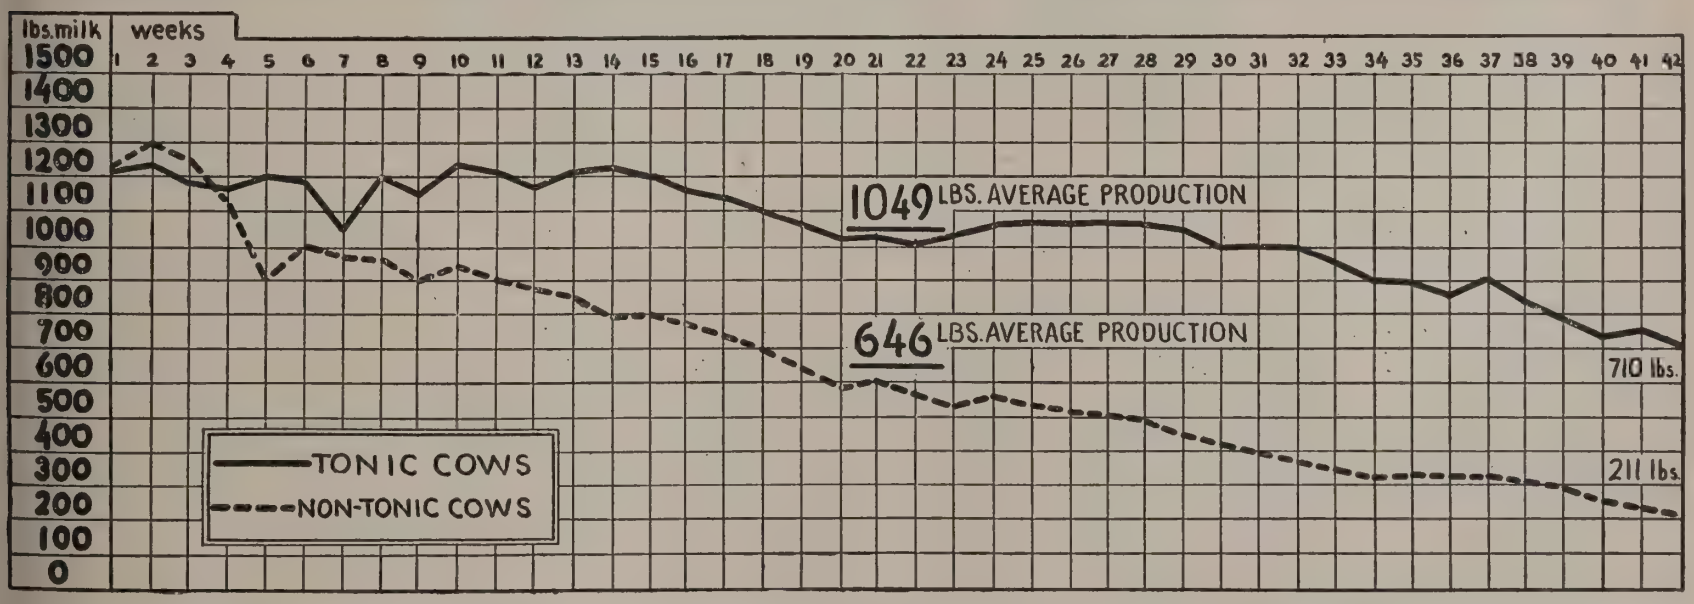


Research Farm—Dr. Hess & Clark, Inc., Ashland, Ohio

Tonic Group

These five ordinary-grade cows were on pasture in August when they freshened. In September they received a common dairy ration of ground oats, corn, bran and oil meal. Beginning October 1st Dr. Hess Improved Stock Tonic was added to their ration and they were placed in competitive test with the five other cows shown below.

These five cows are as nearly like the cows above in grade and condition as possible. They also freshened in August while on pasture. During the month of September they received the same ordinary ration and care as the cows above. However, during that month these cows gave more milk than the others on the same feed and care. After October 1st they were continued on the same feed with the exception that they did not receive any Dr. Hess Improved Stock Tonic.



Non-Tonic Group

We give below a graph showing the milk production by weeks of the above two groups of cows. Follow carefully these two lines which tell a very interesting story. They demonstrate the effect of Dr. Hess Improved Stock Tonic on milk production.

Remember this is purely a comparative test between two groups of ordinary grade dairy cows both receiving an ordinary dairy ration, and ordinary care. No effort was made for high production.

Note: The cows in both groups were on pasture until the end of the 10th week. Returned to pasture at the end of the 36th week. In the meantime ensilage and hay were substituted.

OBSERVATIONS—In the above graph note a sustained milk production by the Tonic cows. These cows started at 1209 lbs. per week and averaged 1049 lbs. for the 42 weeks. During the same period the Non-Tonic cows averaged 646 lbs. per week.

While the Non-Tonic group decreased in their production at a normal rate of approximately 9% per month the Tonic group lost approximately only 3% per month.

As a result of this sustained production the Tonic group gave 16,900 lbs. more milk than the Non-Tonic. Tonic used cost $22.50.

The Non-Tonic group were irregular eaters, off their appetites occasionally, four of the five cows were gargety at times.

The Tonic group were regular eaters; steady every-day producers. While associated with the other cows in the barnyard and pasture not one of these five showed any symptoms of garget

EASTERN STATES EXPOSITION

COLANTHA HARK DELAPHENE, SENIOR AND GRAND CHAMPION HOLSTEIN COW
OWNED BY ELMWOOD FARM, ILLINOIS

HURLWOOD SIR SEGIS WALKER, JUNIOR CHAMPION HOLSTEIN BULL
OWNED BY HURLWOOD HOLSTEIN FARM, MASSACHUSETTS

CLEMATIS OF KINNELON, SENIOR AND GRAND CHAMPION BROWN SWISS COW
OWNED BY W. J. KINNEY, NEW JERSEY

WHEN one goes to the Eastern States Exposition he expects to find a good show and so far we have never been disappointed. It is an unusually good display of the Eastern States agriculture including, of course, the machinery which helps to make that agriculture possible.

The eleventh exposition held at Springfield, Mass., Sept. 18—24, was, if anything, larger than last year and was certainly as good as previous shows. There was but one day of bad weather during the entire week this year and as a result attendance records were broken, thousands more going through the gates than did in 1926.

Eleven judging teams representing Vermont, Cornell, Maine, Massachusetts, Pennsylvania, Maryland, Rutgers, New Hampshire, Syracuse, Connecticut, and Rhode Island entered the college students' judging contest and finished in the order named. This is the first year that Vermont has had a judging team and since their coach, Professor M. H. Campbell, came to the college less than a month before the contest their placing speaks very well for the work of both the boys and their coach.

The Maine boys were the best judges of Guernseys, those from Maryland led with Holsteins, Cornell judged Ayrshires best, and Pennsylvania State led in the judging of Jerseys. L. H. Marvin of Vermont was the best individual judge, all breeds considered, but his teammate, R. T. Holden, led with Guernseys; D. S. Stubbs of Maryland ranked first on Holsteins, C. F. Blener of Cornell was the best Ayrshire judge, and R. R. Peters was the ranking Jersey judge.

Junior work is an important part of the Eastern States Exposition. Camp Vail and the Junior Achievement Building house some exceptional exhibits by Boy Scouts and by members of 4-H clubs from the eastern states. There is, in addition, a very good showing of live stock by these club members. The dairy calves they showed this year, particularly the winners, were a distinct improvement over those of 1925 or 1926 but there are still too many poor calves being shown by those youngsters, something for which their parents or club leaders must take most of the responsibility. Barbara Luchsinger of New York showed the best Jersey, a senior yearling heifer; Frederick Brewster, Massachusetts, won the championship on his 2-year-old Guernsey; Vito Luciani, Connecticut, led the Ayrshire club boys and girls with a 2-year-old; and Hilton Boynton's (Massachusetts) senior yearling was the best of the 26 Holstein calves shown.

THE WINNING UNIVERSITY OF VERMONT DAIRY CATTLE JUDGING TEAM AND COACHES

Standing, left to right: R. T. Holden, L. H. Marvin (high man in competition), H. N. Montague (alternate), R. E. Reed. Seated, left to right: R. W. Smith, Jr., coach of Dairy Products Judging Team; H. B. Ellenberger, head of Dept. of Dairy Husbandry, University of Vermont; M. H. Campbell, coach of Dairy Cattle Judging Team.

The Dairy Cattle

The dairy cattle show this year was larger than ever and while one or two breeds weren't quite up to the usual Eastern States standard, the others more than made up for it. A part of this increase is, of course, due to the Brown Swiss classes which were not included in previous shows. This breed is making rapid strides forward and should have been represented here before.

There were, all told, just over 700 dairy cattle from 12 states and Canada shown in the open classes and these, of course, pretty well included the good ones from earlier eastern fairs and some from farther west.

The Jerseys

Judge: G. C. White, Connecticut

The Eastern States Exposition always has one of the best Jersey shows of the season and it was that this year. There were a few less animals through the ring than in 1926 but the quality was better and that quality extended pretty well down the line in many of the classes. There were 120 head from four states that kept judge busy a full day and a half

In the aged bull class Benedicti Oxford Lad, last year's grand ch pion from Hempstead Farms, Fern's Rochette Noble, owned by linghuysen, were outstanding. The ter, although he lacked the stretc last year's winner and needs to be up better behind, is a better balan better topped bull and very few of ringside questioned his right to place.

Three more of the four remain bull classes were won by Frelingl sen and while we would have ferred to see Elm Hill win the year-old class as well as that calves it would have made no di ence in the championship competi The aged bull was the best one sh and Fern's Signal of Oaklands, winning senior yearling, was the junior. The championships placed way.

The thirteen aged cows were best class of milking females of breed that we have seen for quite s time. There was just one that did carry a full udder, and there was even one really poor cow in the lot

Last year Blonde's Cunning Mo owned by John S. Ellsworth, Con ticut, was just about the best Je cow shown anywhere. She was in ring and looking fit this year, there was one better cow th Eagle's Grey's Princess, from He stead Farms. She wasn't quite good at the rump as was Mr. Ells worth's entry, but she is a stron cow with a better spring of ribs, ter depth, and a very good udder. was a good winner in a good class

Mr. Ellsworth came right back a winning 4-year-old. Elm Hill the best 3-year-old and we thou their daughter of Xenia's Sultan the best 2-year-old but the ju picked on a refined little one f Twin Oaks.

When these four cows came out senior championship, the 4-year

SENIOR AND GRAND CHAMPION JERSEY COW, SUCCESSOR'S CROWNY

CHAMPION JERSEY CALF, SYBIL'S SEA GIRL'S MAY LADY, AND OWNER, BARBARA LUCHSINGER, N. Y.
Miss Luchsinger won showmanship prize over all breeds.

SENIOR AND GRAND CHAMPION JERSEY BULL, FERN'S ROCHETTE NOBLE
OWNED BY TWIN OAKS FARM, NEW JERSEY

l the aged cow were outstanding. her was good enough to be a first ss champion but the 4-year-old, cessor's Crowny, was enough bet- from withers to pins to win.

Oxford Noble's Briar Rose, a junior rling owned by Twin Oaks, was an y winner among the junior heifers. Elm Hill headed the line in the get sire class with four good ones by ia's Sultan—the first prize bull t, the second prize 2-year-old bull, fourth prize cow, and the second ear-old heifer.

The Guernseys

Judge: John Clark, New York

The Springfield Guernsey show this r was the best the breed has had quite some time. There were 160 d from 21 herds in five states that e into the ring for the single sses—a big show without any ft spots" for a showman. While a. H. Williams, The Larsen Can- g Co., and Emmadine pretty well nopolized the head of the line—Mr. lliams was the heaviest winner h nine blues—there wasn't a ss where other contenders weren't hing those from these herds hard their places.

The two outstanding entries in the d bull class, Shorewood Resolute m Emmadine Farms and Border g of Roberts owned by the Larsen , have met several times in the t three seasons, usually to the ad- tage of the New York bull. A year they placed that way but this r the Wisconsin entry looked bet- to Mr. Clark and he placed him He found "Border King" better nted, better at the pins, and better his feet, enough better to overcome ough tail setting and a little heavi- s at the shoulders. The Larsen l was an easy senior and grand mpion after that.

Mr. Williams' Aiyukpa herd had of the three winning junior bulls neither was quite good enough to t Resolute's Eminent, the senior rling son of Shorewood Resolute m Emmadine, and he was junior mpion.

When the fifteen aged cows lined up imagine more than one breeder at ringside looked at them with cov- us eyes. They were such a ring Guernseys as one seldom sees— d enough so that some of those m the line would be champions at re than one state fair. Shuttlewick rity, one of the best Guernseys we r saw, was a recognized first. She a class leader with the right kind conformation to fit her to be the n of real herd heading sons. Her sest competitor was Imp. County wer of Langwater, a 10-year-old tron of much the same type but king a little in udder veins and tom line. Either of these two would t most Dairy Show champions but, course, "Levity" came first.

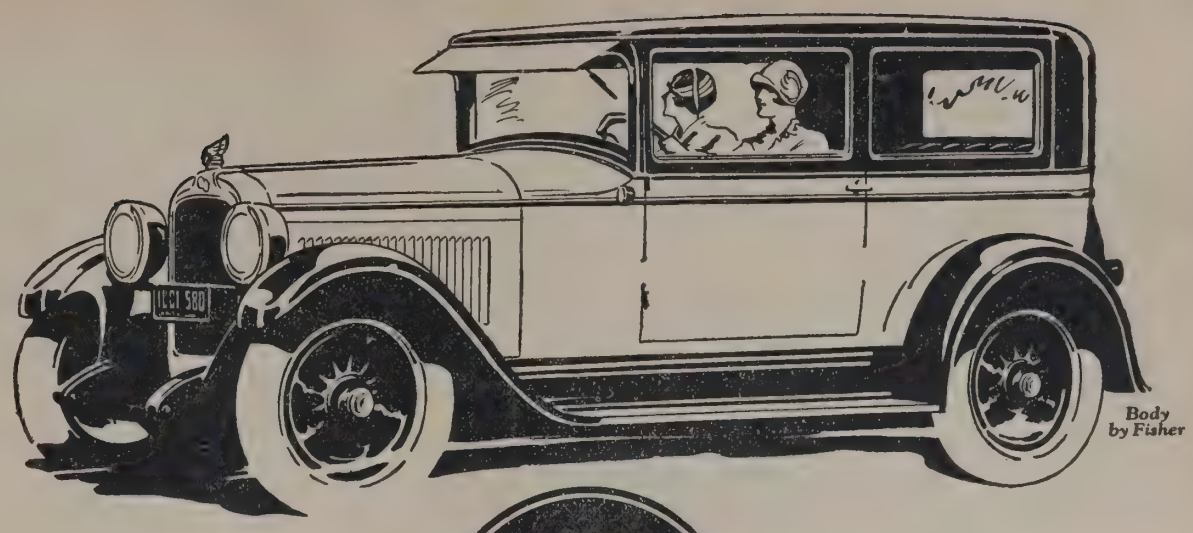
Another daughter of Langwater rity, Shuttlewick Happy Girl, also m Aiyukpa, beautifully bodied but so good as to udder, won the 4- r-old class and a 3-year-old from Larsen herd made a good top to 3-year-olds. When it came to the ear-olds it was close between Cher- s Queen of the Prairie, owned by lliams, and Foremost's Babette, madine's grand champion at the w York State Fair. The Cherub fer had the advantage in scale, a le better head, and was better over rump but Babette was smoother l seemed to us to carry the better ler. Judge Clark favored the larg- heifer and put her up. Below those were several good heifers; one of m, Lady Renown of White Farms, d enough, it looked, to go higher n sixth place where she finished.

Shuttlewick Levity was an out- nding senior and grand champion and Imp. Aiyukpa Comique, a junior yearling, was junior champion.

In the get of sire class Emmadine Farms came to the front with a quartette by Langwater Foremost that included a third place junior yearling bull, the second and third place 2-year-old heifers, and the fourth senior yearling.

The top two placings in the produce of dam class went to an unusual group from Aiyukpa; the grand champion, Shuttlewick Levity, and her 4-year-old sister were first, of course, and immediately below them were two daughters of the grand champion herself, altogether such a family group as one seldom sees in the same ring.

The Ayrshires



Judge: Louis Seitz, Wisconsin

This was Ayrshire year at Eastern States for not only did the red and whites make the largest showing of any of the breeds but it was a corking good quality show as well. There were just short of 200 Ayrshires from 15 herds representing Massachusetts, New York, Connecticut, Pennsylvania, Maine, Michigan, and the province of Ontario—undoubtedly the largest showing of the breed we will have in this country in 1927.

They started the judge off with one of his hardest classes, 23 bull calves, most of them good ones, but it wasn't until he got to a small group of senior yearlings that he found his junior champion, Strathglass Kirbo, from Mr. Chisholm's Strathglass herd.

The two best bulls of the show were Alta Crest Ringleader and Hobsland Lucky Star in the aged class. Lucky Star, grand champion at the Syracuse

Now-
Your dollar buys more than ever
with a Finer Pontiac Six selling at lower prices

Ever since it flashed into the field, the Pontiac Six has won its success on the basis of dollar-for-dollar value. When introduced, it represented a new idea in low-priced sixes—the idea of truly high quality in design, performance and appearance. And it won world record public acceptance almost overnight.

Yet now your dollar buys more than ever—for today's Pontiac Six embodies many improvements in the original Pontiac Six design. It is now offered with beautiful new Fisher bodies in new Duco colors and every body type has been reduced in price!

You may have heard that the Pontiac Six is a marvelous car for performance.

You may have admired the sparkling beauty of its Fisher bodies.

You may have read that a new measure of value was created by this finer Pontiac Six selling at lower prices—but until you actually see today's Pontiac Six, and actually sit at the wheel, you cannot know how fine a six can now be bought for $745!

New lower prices on all passenger car body types

(Effective July 15)

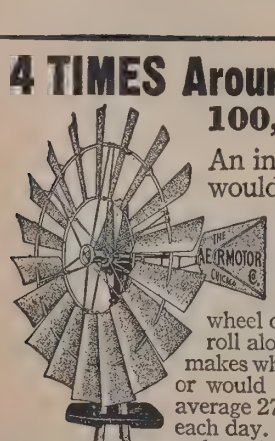
Cold-weather ignition for the farm engine

NOW is the time to equip your engines with Eveready Columbia Dry Battery ignition. These batteries provide the hottest, surest kind of sparks for a quick, easy start and a steady run in the coldest weather. Get reliable engine operation all winter by installing Eveready Columbia Dry Batteries now.

Dry battery ignition cuts the first cost of a farm engine and lowers the cost of operating it. Eveready Columbias are inexpensive to install and you certainly get long service from them.



On the engine that is exposed to the weather use Eveready Columbia Hot Shots. Their steel cases are absolutely water-proof and they keep the engine running in spite of drenching rain and driving snow.

4 TIMES Around the World with ONE OILING

100,000 Miles Without Stopping for Oil

An inventor who could develop an airplane which would perform such a feat would be considered a wonder. But such is the record of regular accomplishment by the Auto-oiled Aermotor in pumping water.

Did you ever stop to think how many revolutions the wheel of a windmill makes? If the wheel of an Aermotor should roll along the surface of the ground at the same speed that it makes when pumping water it would encircle the world in 90 days, or would go four times around in a year. It would travel on an average 275 miles per day or about 30 miles per hour for 9 hours each day. An automobile which keeps up that pace day after day needs a thorough oiling at least once a week. Isn't it marvelous, then, that a windmill has been made which will go 50 times as long as the best automobile with one oiling and keep it up for 25 or 30 years?

The **Auto-oiled Aermotor** after many years of service in every part of the world has proven its ability to run and give the most reliable service with one oiling a year. The double gears, and all moving parts, are entirely enclosed and flooded with oil. **Aermotors and Aermotor Towers withstand the storms.**

HOW THE STATES RANK

IN the accompanying table is given the production of dairy products by states for 1926, but it includes only those products manufactured in factories and does not include milk and cream consumed as such or milk made into butter or cheese on the farm. It includes about 47 per cent of all milk produced, percentages used for various purposes being given in Table II.

When all manufactured dairy products are reduced to terms of whole milk, Wisconsin stands first with 7,902,252,000 pounds whole milk equivalent, or 19% of the total milk going into manufactured dairy products. Minnesota comes next with 14%, and is followed by Iowa with 9%. The next seven states in their order of production are: Ohio, Michigan, California, Nebraska, Illinois, New York, and Missouri. These ten states produce 73% of all manufactured dairy products.

Minnesota Leads in Butter

We give below the leading states in the production of the more important dairy products in 1926:

Creamery Butter: Minnesota is first with 269,550,000 pounds, or 18% of the total, followed by Iowa with 12% and Wisconsin with 11%. No other states produced in excess of a hundred million pounds. The next seven states are: Nebraska, Ohio, Michigan, California, Missouri, Illinois, and Indiana. These ten states produced 75% of the total factory butter.

Factory Cheese: Wisconsin comes first with 304,777,000 pounds, or 71% of all the factory cheese. Next in order comes New York with 12% and Oregon with 3%, followed by Minnesota, Idaho, Illinois, Michigan, Pennsylvania, California, and Washington. These ten states produce 97% of nation's factory cheese.

Condensed and Evaporated Mi Wisconsin again ranks first w 533,490,000 pounds, which is 31% the nation's total. Next in or comes California with 10% and Mi igan with 9%, followed by New Yo Illinois, Ohio, Washington, Penns vania, Indiana, and Utah. These states produce 80% of the natio condensed and evaporated milk.

Ice Cream: Pennsylvania forges the front with 32,280,000 gallons, 15% of the total. New York co second with 11% and Illinois is th with 8%. Next in order come Oh California, Michigan, New Jers Massachusetts, Wisconsin, and In ana. These ten states produce 64% all the manufactured ice cream.

Skimmilk Powder: While a product of whole milk, the manuf ture of skimmilk powder is of int est here because it has increased fr 73,317,000 pounds in 1925 to 91,71 000 pounds in 1926, or 25% in c year. California leads with 26,352,(pounds, or 29%. New York follo with 25% and Washington with 11 Other states with production in cess of a million pounds follow in order given: Wisconsin, Michig Pennsylvania, Illinois, and Minneso These eight states account for 95% the total production reported.

Other Products: On a national sis the other manufactured produ of milk are not of so great imp tance, but it may be of interest note the leading states. New Y leads in cottage, pot, and bakers che with 21,198,000 pounds, or 31% of total; in whole milk powder w 6,194,000 pounds, or 58%; in dr

Farm Fire Prevention

Just 56 years ago, a cow in Mrs. eary's barn kicked over the lann that started the great Chicago on October 9, 1871. Fire Preition Week, October 9 to 15, 1927, perhaps a reflection on Mrs. eary's famous cow. Our everyday elessness now costs annually 10,) lives and over a half billion dols.

sn't it time to do something to p the terrible destruction brought ut by the dragon tongues of fire? What a picture of desolation and pair is contained in the following wspaper clipping:

'When the sun rose this morning farm house and chicken coop re the only buildings left standing the farm of Joe Turney, six miles t of Thomson. Lightning struck barn during the electrical storm ween midnight and 1 a. m....The n was burned to the ground. The n crib, hog house, and garage, ig-ed by sparks from the blazing n, were also destroyed...One se and three hogs were lost in flames."—Savanna, Illinois, Times rnal.

And from a Pennsylvania newspacomes this one:

'Montrose, July 27.—Twenty cows re hurled to the floors of their lls, one of them falling on a womwho was milking, and a farm se nearly caught fire when bolts lightning struck the barn and se of Lewis Rose last night at 7 lock."

Lightning is one of the chief causes farm fires. It has been estimated t the annual farm property loss m lightning is $20,000,000 at a imum.

This loss can largely be prevented proper lightning protection on ldings and by grounding at reable intervals all wire fences ensing pastures or yards for live k, according to a report of the m fire protection committee of the ional Fire Protection Association. The annual number of farm pers killed by lightning is between and 500 and the number injured nore than twice those killed.

Metal fences, wire clothes lines, or exposed wires should not be conted to buildings because they act feeders for electric energy which pt to bunch up in its structure.

Something like 200 years ago Ben nklin had an idea. One stormy ht he flew a silk kite in the clouds saw electricity travel down the p string, felt the shock from the to which the cord was attached. Ben Franklin discovered that lightng is composed of electricity. He ented the lightning rod which has n perfected by modern manufacers into a very efficient means of tection for property and human s.

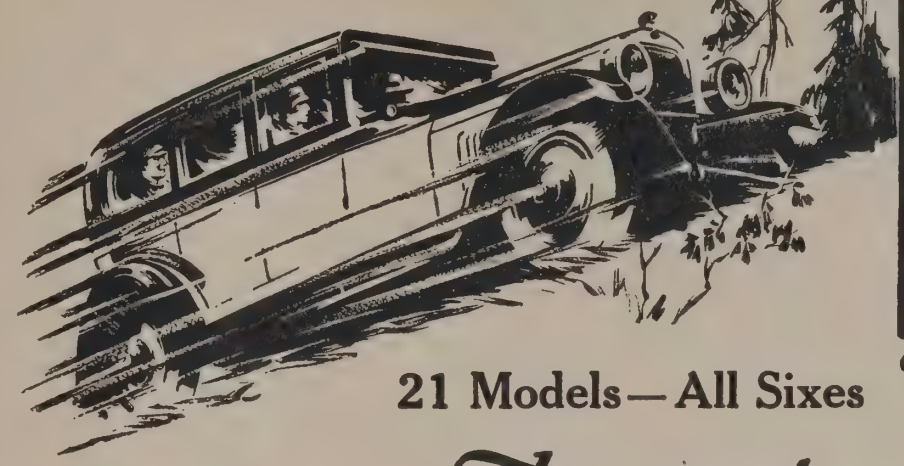
An ounce of prevention is worth ound of cure" is certainly true of fire hazard on the farm. To put fires as soon as they start is aner way to cut down farm fire loss-

D. L. Williams, a dairy farmer Waukesha County, Wisconsin, has extinguishers conveniently located in his barns and other farm buildings, as protection in emergencies.

To secure water pressure for fire fighting is a real problem on the average farm. In most cases of need the old bucket brigade to the pump is entirely inadequate and many a barn has burned to the ground which might have been saved either completely or partially had there been water pressure available.

Some communities are solving this problem by purchasing and maintaining, for rural use only, trucks and fire fighting equipment on a par with the modern city fire apparatus.

Up on the experiment station farm for the Upper Peninsula of Michigan located at Chatham within eight miles of Lake Superior, two fires coming at a close interval destroyed expensive farm buildings. They are now equipped to meet such an emergency should it arise again with a power outfit which can be attached to an automobile engine, a type of fire fighting equipment which is on the market.



Has fire ever gutted one or more of your farm buildings? Has lightning exacted a toll from your household? Don't wait until you have paid the price of carelessness and negligence. Properly installed and maintained lightning rods protect. Fire extinguishers are a safeguard. Equip to meet the emergency! Every week is fire prevention week!

Sell your surplus cows, poultry and other live stock with an ad on our Special Opportunities Page.

NASH

Leads the World in Motor Car Value

Come drive

3 NEW SERIES • NEW LOWER PRICES

$865 f. o. b. factory upwards

21 Models—All Sizes

The most

Powerful

cars Nash ever built

The great *POWER* of these new Nash models will be a revelation to you.

They *"pull"* the steepest grades or the heaviest going with absolutely amazing ease and smoothness.

For there's *EXTRA* power engineered into every Nash motor. They have the extra efficiency of the *STRAIGHT LINE* drive so that Nash power flows directly from the engine to the rear axle in a straight line.

They take hills or mud without a note of strain—without the least of laboring.

Come *DRIVE* one of the new Nash models. Test out the *QUANTITY* of its power as well as the *QUALITY*.

The newly-refined 7-bearing motors give Nash *the world's smoothest* power-flow throughout the whole range of use.

All crankshafts are balanced integrally with clutch and flywheel to make the new Nash the smoothest, *"sweetest"* car you ever drove.

And they're the *EASIEST* riding, easiest steering cars you ever handled with their new secret process alloy-steel springs and newly improved steering mechanism.

New *LOWER* prices make these new models the *GREATEST* values on the market.

The Switchboard

An Advertisement of
the American Telephone and Telegraph Company

A WEB of cords plugged into numbered holes. A hand ready to answer signals which flash from tiny lamps. A mind alert for prompt and accurate performance of a vital service. A devotion to duty inspired by a sense of the public's reliance on that service.

Every section of a telephone switchboard typifies the co-ordination of human effort and mechanism which makes possible America's far-reaching telephone service. Its cords link for instant speech those who are separated by a few miles or by a continent.

Its guardian operators are of the telephone army—men and women vigilant to meet a nation's need for communications.

In plant and personnel, the Bell System is in effect a vast switchboard serving a nation that has been transformed into a neighborhood through telephone growth and development.

COW TESTING PAYS

E. B. FITTS, PENNSYLVANIA

DOES membership in a cow testing association pay? John Wirt of Pennsylvania says that it does. He joined the Mifflin County Association in 1924. The milk production of the twelve cows in his herd for the first year averaged 5,500 lbs. per cow. Mr. Wirt was a careful observer of the work of each individual cow during that first year and was impressed by the great differences in amounts of milk produced by different cows in the herd under the same general conditions. At the close of the year when the final results were at hand, he concluded that the milk production of four of his cows was so small that he could not afford to support them longer and they were sold.

The second year from the eight remaining cows an average milk production of 7,300 lbs. per cow was realized; an increase of 1,800 lbs. over the average of the previous year. During both the first and second years he was carefully studying the question of feeds and methods of feeding and herd management, drawing lessons from the experiences of other members of the association, and picking up information and ideas from the tester and from other sources.

At the beginning of the third year Mr. Wirt set for himself a still higher goal in average production. Two of the lower producing cows we sold during this year and two adde one a heifer from the herd and o purchased. As this is written, t third year is not quite complete b the average yield will equal or e ceed 9,000 lbs. per year. This is increase of 3,500 lbs. per cow ov the average of the original herd. T total production of milk from t eight cows will be 72,000 lbs. a will exceed by 6,000 lbs. the tot produced by the twelve cows in original herd. The value of this i creased production at $3.00 per hu dred is $180. To this sum should added the saving in milk producti costs realized through the prese higher average production per co if we are to show the total increas net return. According to figur compiled by the Extension Far Management Department of t Pennsylvania State College, the d creased cost associated with an i crease of 3,500 lbs. of milk is n less than $1.25 per hundred pounc Applying this factor to the 72,0 lbs. of milk produced, the result $900. This, with the $180 mention above, makes a total of $1,080 whi is the sum of increased net retur from the present herd over that the original herd.

The cost of association membe ship is less than $50 per year. Is any wonder that Mr. Wirt is a boos er for cow testing association worl

Small Grain for Silage

HOARD'S DAIRYMAN:—Three years ago we built a crib silo as recommended by the Minnesota Farmers' Institute for farmers in wooded sections. It was built octagon, or eight-sided, of tamrack 2x4's and plastered inside with a double coat of cement plaster. We took advantage of a rainy season and built the silo when we had nothing else to do. It took perhaps sixty working hours to complete the building. The cash outlay was $43.50, which included cement, nails, and other incidentals as well as the cost of the logs and sawing them into 2 x 4's. We cut the logs ourselves.

BARN AND CRIB SILO ON GROVE FARM

As there was no silo filler in the community, we planned to use oats and barley as a silage crop the first year. As this first trial was so successful, we have used the same combination ever since. The gin pole, 55 feet long, was placed beside the silo and slanted about 65 degrees from horizontal so that the top was nearly over the center of the silo. It was held in place by a cable from the rear and a guy wire on either side. One end of the hay rope is tied to the top of the gin pole and then runs through a pulley in the hay fork, up through a pulley at the top of the gin pole again, and then down along the pole to a pulley at its base and then to the team.

The fields of grain containing the most sow thistles were harvested for the silo. The grain was cut at t late dough stage, raked and put in t same day if possible. No water w used unless the grain was badly wil ed. Rather small forkfuls were tak up each time and great care w taken to spread it evenly and tramp it well along the walls. Ea forkful was spread out so no airhol would form and start mold.

The silage comes out a dark gre color, sweet smelling, and is great relished by the cows. If it freezes the wall, a hay fork or an axe is us to cut it loose.

As there is no roof, the silo packed full to the top and ev heaped. We always refill ours aft it has settled several days. Late the fall after we have begun feedi and before cold weather sets in, false roof is hung inside the si about two or three feet from the to This cover is made of poles and th straw is placed on top and secure fastened down. The snow, as it fa on it, effectually seals the top again cold weather and the elements.

The advantages of the silo and t combination silage is that it is entir ly home-made at a small expens There is no investment in a silo fill and all the crew required is one two teams and two or three men. has proven very successful with small herd but might be impractic with a large one. There is anoth advantage in this plan, it allows t early removal of crops from a wee field. This is especially useful in section badly infested with sow thi tles. By plowing immediately aft cutting the grain and keeping t field cultivated until fall, we ha been able to cope successfully wit one of the worst pests of the Re River Valley, the sow thistle.

Minnesota. MORRIS C. GROVE.

"An' how's yer wife, Pat?"
"Sure, she do be awful sick."
"Is it dangerous she is?"
"No, she's too weak t' be dange ous any more."

New Finger Pull milk bottle cap

A dandy new low cost bottle cap that is sanitary. Easily removed with fingers. Protects both milk and bottle. Makes new friends; holds the old ones. Adds to the popularity of your product. If Your Dealer Does Not Handle Goods Advertised in Hoard's Dairyman—Ask Him Why!

"If—for *any* reason, the valve chamber on this Milker should be damaged, or get out of order, we will repair or replace it free of charge, *during the life of the machine.*"

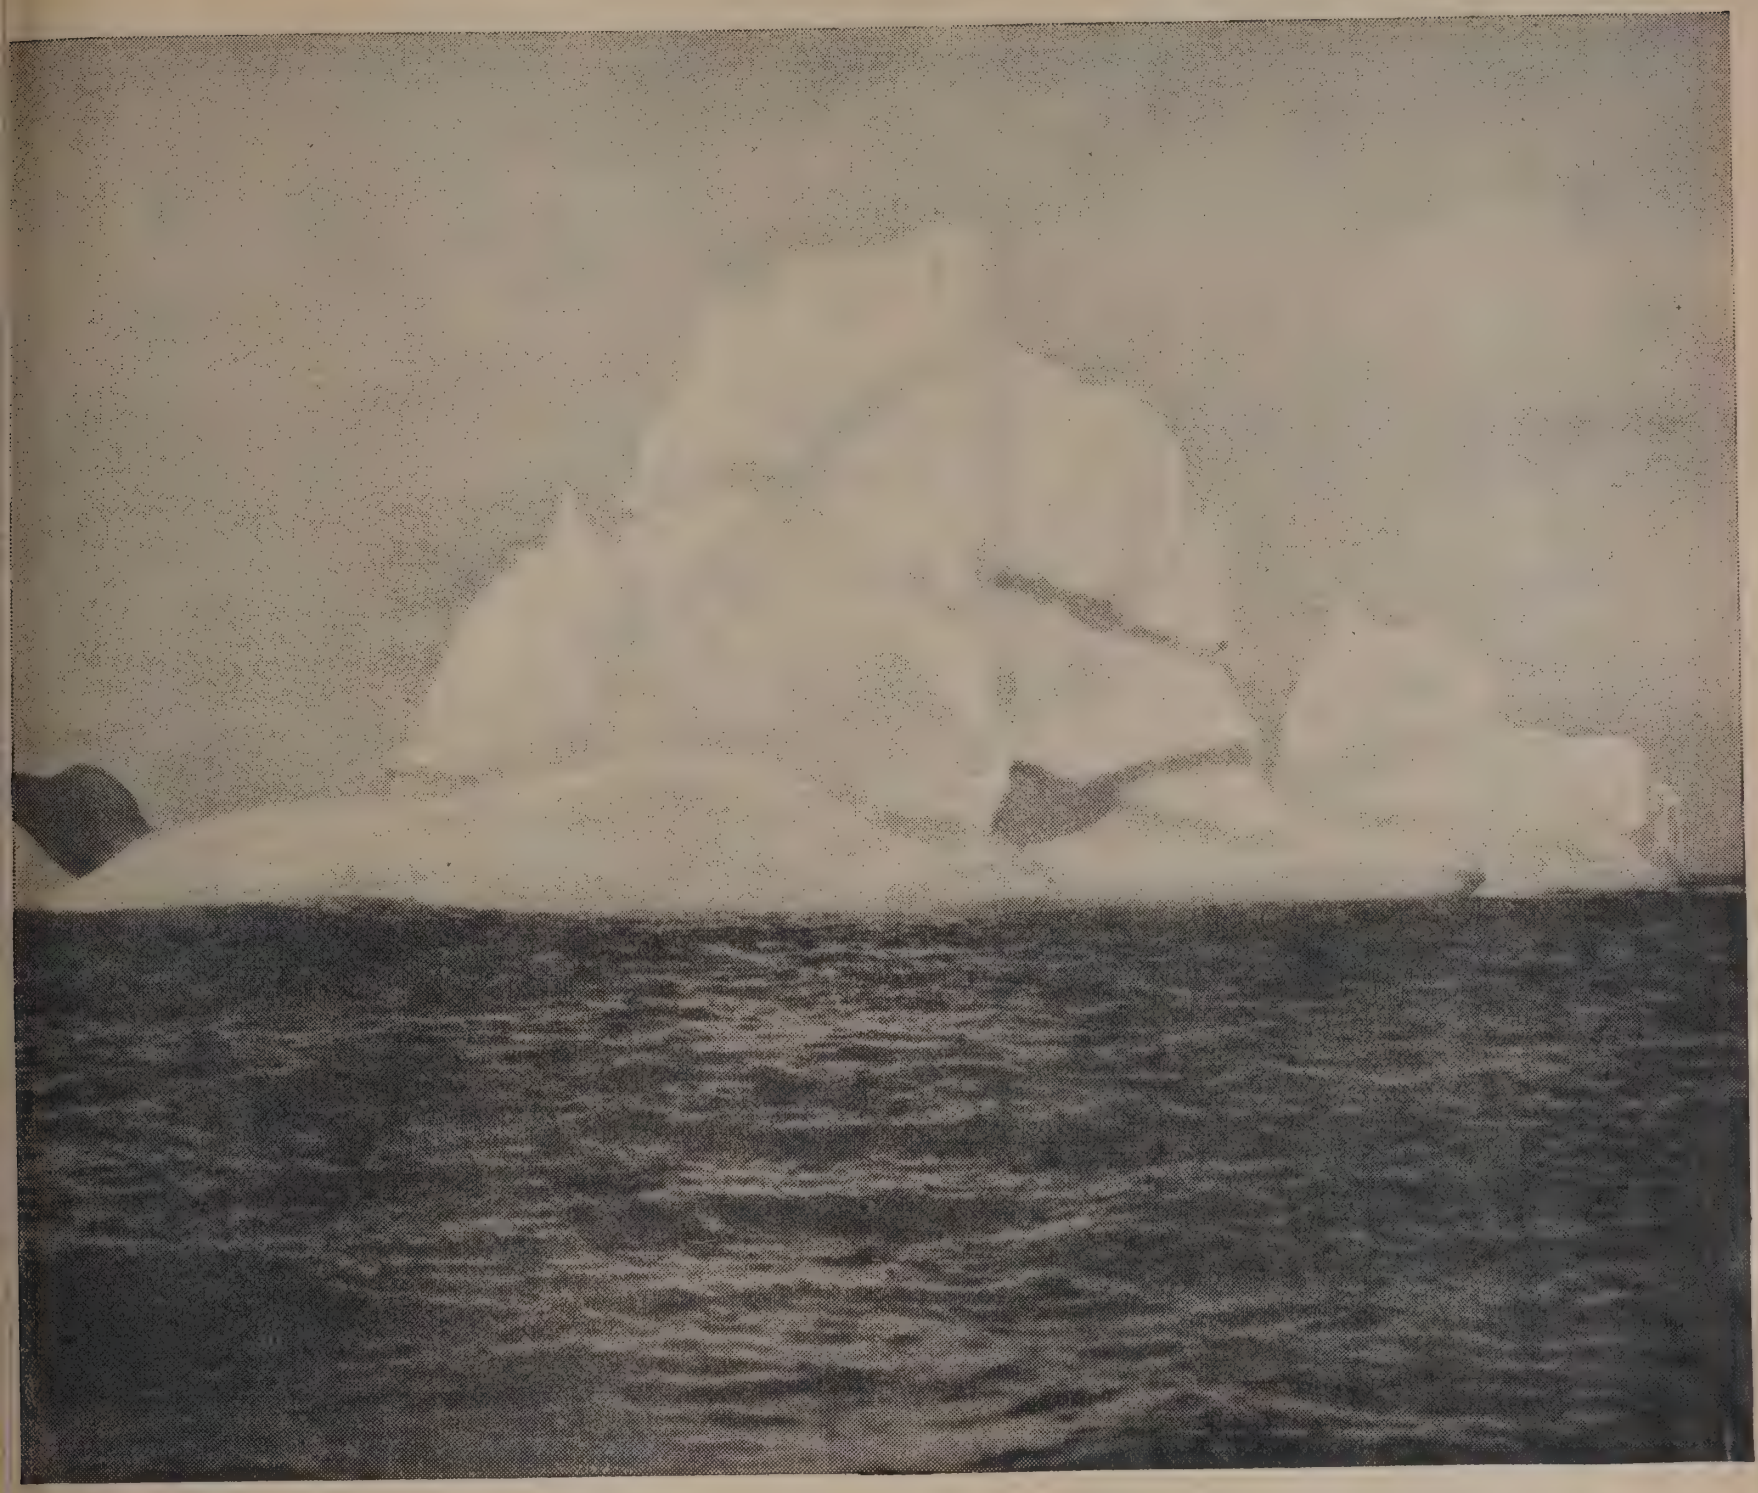
What THIS Guarantee Means

19 years ago, the first Hinman Milker carried the above guarantee.

From that day to this, *no Hinman owner has ever had to buy a new valve to replace the original one.*

THIS GUARANTEE MEANS

1. That from the start, the Hinman idea has been to sell *dependable, day-after-day machine milking*—not just a machine.
2. That the Hinman Valve, so simple it hasn't even a spring, *has* to be reliable or we couldn't afford to make that guarantee.
3. That of the two moving parts on the Hinman (aside from power) the only one that needs factory attention to adjust it, is protected by free service *as long as you operate a Hinman Milker.*



Think what that guarantee means! And then get *all* the facts. Find the other reasons why the Hinman is today "the milker most dairymen use."

Send for the Hinman Catalog. Write today.

AFTER SHAVING

HERE IS A GOOD BET

Have you ever tried Listerine after shaving? You will like that cool as ice sensation.

We are so certain of this that we are willing to risk the cost of this page (more than the average man's yearly income) to tell you about it.

After your next shave, just douse Listerine on full strength and note results. Immediately, your skin will tingle with new life and vigor. Then, over your face will steal a lingering and delightful sense of coolness such as you have never known before.

And as it cools, Listerine also heals—takes the smart and burn out of tiny wounds left by the razor and lessens the danger of infection. Go ahead and try Listerine this way. We dare you. Lambert Pharmacal Company, St. Louis, Mo., U. S. A.

EVERYBODY'S TALKING

Everybody's talking about the marvelous whiteness of teeth after using Listerine Tooth Paste a short time. You will be delighted. Large tube, 25c.

LISTERINE

—the safe antiseptic

Dining Room—Living Room Combination

A young friend of ours who married and planned a home a few years ago has always been of the old fashioned hospitable type that loves big rooms and a spacious air outside and in. We visited her after she had been married five years and the house she had planned expressed her personality perfectly, the kitchen especially. It was as big as the ones down South you read about, with huge cupboards on two sides and a pantry as large as a modern kitchen opening from it, besides a back porch that had another closet built on it for overshoes, brooms, and other such things. Everything was immaculate and the lovely air of hospitality that pervaded every nook and cranny warmed the heart of a guest.

The other day a letter came from her. "We are building again," she wrote. "You'll think when you see the enclosed plan that I've gone crazy but I feel that I've really come into my right mind. The house of my dreams is still the roomy, big place with stores of supplies and everything ready for any amount of company but I find that the world has changed too much to make such living feasible. I am simply exhausted trying to rear my family and keep up with my house, so don't laugh when you see these plans."

They were, indeed, different and the most noticeable difference lay in the fact that there was no dining room at all and the kitchen was no more than a patch on her old one. It lacked the homey, comfortable look of the other but it did look easy to work in.

With life speeding up as it is, such arrangements as this are becoming more and more common. They usually have a breakfast nook in one corner of the kitchen and a folding gate-leg dining table in one end of the living room so that it can be put away and the space used. These tables can now be had with extensions that make them large enough to seat ten persons.

The arrangement shown in the accompanying pictures was worked out on a model basis. The living room is very large with windows along one side, a fireplace in one end, and in the other a built-in cupboard that serves for dishes, linen, silver, and a few books.

A bedroom opens from one end of this room at right angles to it, the kitchen is in a corresponding position at the other end, the bathroom opens from the bedroom, and between kitchen and bedroom is the entrance hall. For two people it is an ideally cosy arrangement and the principle of it can be enlarged to accommodate many more.—LUCY THOMPSON.

DINING END OF BIG LIVING ROOM

Blood-building Foods

A lecture I heard last winter at a Farmers' and Home Makers' Convention struck me as particularly interesting as I had just been hearing a good deal about blood deficiencies; not enough red corpuscles in the blood, deficiency of oxygen in the blood with consequent difficulty in breathing. This lecture, given by a scientist who has experimented long and successfully with diets, was on blood building foods.

He explained that the reason some new-born animals can live so long on milk alone while others cannot is that in the case of the former the liver and spleen are loaded at birth with iron and their systems dole out this mineral to be used along with milk, thus making an adequate diet. This is the case with most of our familiar animals such as the calf, pig, and colt. With the guinea pig it is different; Nature does not provide him at birth with a liver and spleen full of iron but she does provide him with an instinct that tells him he needs it so, often within an hour of his birth, he is seen hopping off looking for a cabbage leaf to supply his mineral needs.

If your doctor has put you on a diet of blood-building foods here are some recipes that may help you with your problem. It is to be hoped that you like liver for it is one of the most valuable blood-builders and is in all these recipes.

Stuffed Tomatoes

Cut stem end from tomatoes, remove pulp, salt, and invert to drain. Parboil one pound of calves liver or beef liver and grind. Season with salt, pepper, and two tablespoons chopped onion. Stuff tomatoes with this mixture, cover with buttered crumbs or small strips of bacon and bake in a moderate oven about half an hour.

Liver Chowder

1 cup ground liver
¼ cup sliced onion
½ cup sliced potato
½ cup chopped celery
1½ inch cube salt pork
1½ cups water
1 teaspoon salt
⅛ teaspoon pepper

Cut pork in small pieces and cook in water 15 minutes. Drain. To the liquor add other ingredients. Simmer slowly for half an hour. Beat the yolk of an egg with 1 cup of milk, add the chowder and stir. Serve hot.

Braised Liver

1 carrot
1 onion
1 stalk celery
1 small turnip
1 pound calves liver
¼ pound bacon or salt pork

Cube vegetables or cut lengthwise and place in bottom of a casserole or tightly covered dish. Place liver on bed of vegetables. Place slices of bacon or salt pork on top. Almost cover with stock or water in which a boullion cube has been dissolved. Cover and bake in a moderate oven for two hours.—LUCY THOMPSON.

Don't Quit

When things go wrong as they sometimes will,
When the road you are trudging seems all up hill,
When the funds are low and the debts are high,
When you want to smile but you have to sigh,
When care is pressing you down a bit,
Rest, if you must, but don't you quit!

I don't know who it was wrote the little verse above but I approve of it for it fits us all.

I was visiting last week a friend whose little boy is four years old. Running across the room as hard as as he could he tripped and fell and at once began to cry. His mother left him alone a moment and then said, "Courage, Jimmie! Don't cry." A few more blubbers and the lad got up and soon was playing happily. There was something so calm, so staying about that mother cry of help and the little fellow's manly response that I felt myself deeply stirred. She was helping him so that later he could help himself for she was giving him in the very tones of her voice sympathy and love and the ability to be self-reliant.

Some recent books have been written around the theme of the mother love that ties its child closer and closer to itself, strangling the child's initiative and independence until it is too old to develop properly and the child is left a moral weakling for life, unable to make his own decisions. The mother who can teach courageous independence to her child when he is small need never fear that she will lose him; he may seem to be lost to her in the years of his youthful growing up but when his mature understanding comes his natural affection will be mingled with the admiration and respect that is the strongest tie of love.

Looking back over what I have written, I seem to have somewhat

(Continued on page 955)

Send for Our Fall and Winter Fashion Magazine

You simply must have a copy of our Fall and Winter Fashion Magazine, for it contains too many good things for you to miss. No. 2954—Ragland Sleeves. Pattern comes in sizes 6, 8, 10, 12, and 14 years. Size 8 requires 1⅞ yards of 40-inch material with ⅜ yard of 32-inch contrasting.

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Our patterns are made especially for us by the leading fashion designers of New York City. No stock of patterns is carried in our office and, since all orders are forwarded to the factory, kindly allow a reasonable time for delivery of any pattern you order.

There's a joker in the "cheap" paint barrel

WHEN anyone offers you a very tempting proposition on "cheap" paint, keep your eyes open. There's a "catch" in it somewhere.

No reputable concern can sell *good* house paint at a "cheap" price per gallon. And no *unknown* house is safe to deal with. No barrel of SWP House Paint is ever "planted" on the station platform. Don't be fooled by this "apple-sauce."

No "quality" paint is ever peddled from door to door or offered in highly colored circulars by some very *friendly* person whom you do not know who tells some impossible tale about saving money for you.

These are sharp tricks that have fooled many unwary buyers. Don't let them fool you. Remember, "cheap" paint isn't cheap at all.

Why SWP *costs less*

"You can't make a silk purse out of a sow's ear." And you can't buy a house paint that will cover and hide and *wear* for years—for a "cheap" price.

Fine old SWP House Paint costs more per gallon. That's because it is made of super-fine materials—in the world's greatest paint laboratories. Because it is mixed and ground to creamy-smooth texture by power-driven machines which no hand-mixing can possibly equal.

But "gallon price" does not indicate the cost of painting. "Low price" is a delusion. Actually, a "cheap" paint costs you from two to five times as much as SWP House Paint. And here is why:

A gallon of SWP House Paint covers 360 square feet, two coats. The average "cheap" paint must be greatly *stretched* to cover, poorly, a mere 250 square feet, two coats.

Therefore, nearly twice as many gallons of "cheap" paint are needed as of fine old SWP to cover the same area. Figure out the cost of the paint on that basis and your eyes will be opened. That is one angle of the "joker" in the "cheap" paint barrel.

Wonderful colors that last

But that's only the beginning. SWP House Paint will beautify and protect your building from two to five times as long as "cheap" paint.

SWP colors are unusually rich and true to character. They do not fade. Weather does not affect them. The film of SWP is tough and elastic. There is no chipping, peeling, chalking.

Most "cheap" paint begins to peel and chip and chalk almost before it is dry. It deteriorates very rapidly. Colors become "wishy-washy." In a very short time you have to burn or scrape the old stuff off and do it all over at heavy expense.

It's easy to see why cheap, trashy paint costs twice as much as SWP House Paint by the year. That's another angle of the "joker."

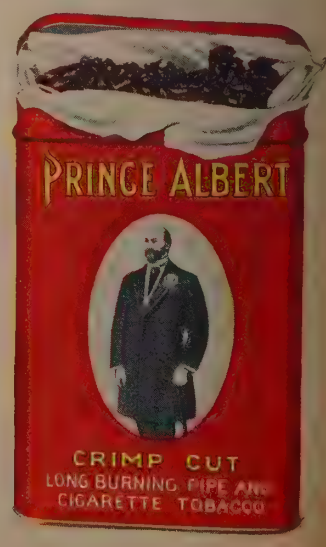
Good old P. A.!



THEY say that "no other tobacco is like it." I want to go a step further and say "no other *experience* is like it!" And I'm ready to prove *that*. Just get yourself a tidy red tin of long-burning Prince Albert. Throw back the lid and release that tantalizing aroma.

No more appetizing fragrance ever floated out of a package, you'll agree. Then tamp a load into your old jimmy-pipe and light up. Here is the supreme test—that *taste*—that Let-me-at-it, Gee-how-I-like-it taste! Never have you experienced anything like this, Men.

Cool as a drink from an artesian well. Sweet as a pear, ready to drop from the tree. Mild and mellow as October sunshine, yet with that full, rich tobacco-body that bangs your smoke-spot in dead center on every fire-up. A thrill you can repeat from morning to midnight.

Not the least of Prince Albert's many virtues is that it doesn't bite your tongue or parch your throat, no matter how swift your pipe-pace. I could tell you a lot more, but I want P. A. to tell you *in a pipe*. For that is testimony no seeker-after-truth can question. Get some Prince Albert now and find out!

P. A. is sold everywhere in tidy red tins, pound and half-pound tin humidors, and pound crystal-glass humidors with sponge-moistener top. And always with every bit of bite and parch removed by the Prince Albert process.

PRINCE ALBERT

—the national joy smoke!

Balanced and shaped for foot comfort

FOR over a generation Hood Red Boots have set the standard for boot quality. Freely imitated in color—but rarely in wear—their tough grey tire-tread soles and non-cracking red uppers are the outdoor man's identification of all-around durability.

Hood Red Boots, like all Hood Work Footwear, are scientifically balanced to feel lighter on the foot—have trimmer lines—they are made over foot-shaped lasts to prevent heel slipping and give greater comfort.

Look for the Yellow Arrow Label at the knee—mark of all Hood extra quality on boots.

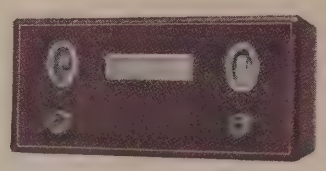
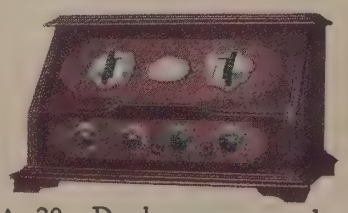
HOOD THE SYMBOL OF WORLD WIDE SERVICE IN QUALITY RUBBER PRODUCTS



This amazing Radiola 16—
the widest musical range ever achieved with one-dial control



IN the new, complete line of RADIOLAS that has just come from the famous research laboratories of RCA, Westinghouse and General Electric, the marvelously compact RADIOLA 16 is an outstanding achievement.

Particularly adapted—like the popular RADIOLA 20—for use on the farm, its simplicity of operation, perfection of tone and high selectivity and sensitivity make it a worthy companion of the more costly sets that carry the well-known RCA mark. The only rival of this new model in the low-price field is the RADIOLA 20.

When used with one of the RCA Loudspeakers, this storage battery set brings into your home the programs from the great broadcasting stations—the finest music, university extension courses, crop and weather bulletins, and the latest news of the world.

RADIOLA 16—Storage battery receiver of great compactness. For selectivity, sensitivity and tone quality, it sets a new standard for receivers in its price class. The cabinet is finished in mahogany.
Less accessories $69.50 . with Radiotrons $82.75

RADIOLA 20—Dry-battery-operated receiver, with amazing sensitivity and many times as selective as the average antenna set. Ideal for distant reception. Can readily be adapted to socket operation. Ideal to use with the new RCA Loudspeaker 100-A.
Less accessories $78 . with Radiotrons $89.50

Like RADIOLA 20 this expertly designed 6-tube receiver can be adapted for alternating current operation from the house lighting circuit by the addition of socket power devices.

l Oyster Bleach Linen Luncheon Set—No. 3452

452

s beautiful luncheon set is stamped on heavy round thread, oyster bleach linen, and will give years of service. The n is charmingly developed in shaded orange and lavender rs with green and white stems and leaves. The square in a combination of blanket and cross stitch in shades of and orange is unique and striking. Size of cloth, 36x36 s, and four napkins 12x12 inches, all sent postpaid on t of price, $1.45. A detailed chart showing where each is to be used is enclosed. Send to Embroidery Department, l's Dairyman, Fort Atkinson, Wis.

ed my theme but if I have it is use, in my mind, the teaching of age to the child is sure to de- p into the "Don't Quit" for the t and that is one of the finest oons with which we can attack job.—LUCY THOMPSON.

Women's Sorcery

n every side today we hear how en are taking up men's ways—dress, their habits, their speech, even their privilege of proposing riage! Modern girls insist that have just as much right to go a man who attracts them as a has to woo a girl. How many of actually do it and what the re- are, is another question.

en have always guarded rather usly their sentimental rights and leges and only lately I have read the men of France have just vered a law passed some 150 s ago which may be the means of ng some of them easily out of their marriages. The law reads something like this:

"Whoever attracts into the bonds of marriage any male subject of his majesty by means of rouge or powder, perfumes, false teeth, false hair, steel corsets, hooped petticoats, or high heels will be prosecuted for sorcery and the marriage will be declared null and void, if the accused is convicted."

The law, they find, has never been repealed. In these days of making Nature "look like what she ain't" it would seem that the married French women might have to go cautiously with such a law on the books. But somehow, "it is to laugh," as they would say, at the simple mindedness of men who, having walked open-eyed into a trap about which they were warned and which they probably enjoyed supremely for a time, then use the law to get themselves out.—LUCY THOMPSON.

TRODUCING THE THREE BEARS

ou've met them of course in y. Now spend some of your e time making them for the lie and let him meet them in per- Xmas day. They appear on page 33 of our new Fashion Magazine. re you'll see a number of attrac- things you can make for Xmas. f course there are, besides, hun- ls of styles for all occasions. Use Soap in Place of Putty —Cooking Eggs

I was despairing over the number of nail holes in a casing over a door when I was painting the other day. I said to the workman who was tearing out cupboards, "Why will people mar their woodwork so by nailing nails in anywhere? I haven't any putty to fill them up." He asked, "Do you know what my wife uses when she is painting? Soap!"

I had a bar of white soap right there and ran the corner over the holes and low and behold the trick was done. Any unevenness was as easily remedied and being white did not show through even the first coat of white paint. I tried to find the filled places when the second coat was on but could not. So I am passing the idea along.

Soap is always to be had easily whereas putty dries up so quickly it cannot be kept over for little odd jobs from time to time.

⚜

A neighbor brought my little son a very tiny egg that she had found among her others. In his eagerness he cracked the shell. I thought we couldn't hard boil it for him then and he was going to be very disappointed as that was the only way he liked eggs. She told me if I put salt in the water the egg would not run outside the shell while boiling which proved to be the case and well worth remembering.

⚜

I have just learned that eggs should not be hard boiled in leaping water. It makes the whites hard and indigestible. Pour the boiling over them, pull back and let cook, not bubbling, 20 minutes. The eggs are much nicer.—E. A. ELLIOTT.

Grocer Brown (between the dances): "There's a lady over there who has been watching you for ever so long; she'll be asking for an introduction soon."

Grocer James: "She won't—she's my wife!"

Aunt Ada's Axioms: Harsh thoughts and words curdle dispositions and digestions.

Four Cornered Partnership

(Continued from page 928)

much faith in silos. It stood until six years ago when our big barn caught fire and burned to the ground."

Graduates From Short Course

Many of the best farmers in every state are graduates from the short courses of agricultural colleges. John Wrage finished such a course at the Washington College of Agriculture in 1907. He then studied dairying at Ames, Iowa, for a year. After he was married to Lena Thomsen in 1909, he took over the farm and he has been operating it ever since.

"We had always had a desire to start raising pure-bred Guernseys," continued Wrage, "but we never felt that we had the money. In 1916, however, O. E. Gibson, dairy extension specialist at the state college, convinced us that we should borrow a thousand dollars and buy some good foundation stock. With this money we bought Gana, and two heifers, Nan and Nancy of Birchwood. Nan of Birchwood later became a class leader and Nancy was a close second. Before Gana could be shipped here from the East she dropped a heifer calf. Her next heifer calf was Gana of Valley Gem who produced 13,285 pounds milk containing 632 pounds fat, which for a year and a half was the world's record in her class. In the same lot with Gana and the two heifers was the bull that sired Nancy Lee who was supped and dined at a Seattle banquet a couple of years ago and later sent to a Honolulu dairy breeder. From that beginning we have sold as many females as we have bought and in 10 years' time our herd has increased to 50 females."

Herd Improvement the Cow Testing Way

At the time we were at Valley Gem Farm the herd held 18 A. R. cows with a mature credit average of 654 pounds butterfat. Thirty of the 50 females in the herd were descendants of old Gana. Some official or semi-official testing has been done every year since 1919, but the whole herd has been in the cow testing association all the time.

Wrage finds that the cow testing association records on different cows are almost always practically the same as the semi-official records. Because of this he said: "We will probably always keep up our official testing but we hope to do our herd betterment work through the cow testing association. We are like most of the other in that we don't run a cow on official test unless she is in good condition. The association records, on the other hand, are for the entire herd and they show what a cow will do year after year."

Cows Have Night Shed

The Valley Gem cows stand in stanchions only when they are eating and are being milked. The rest of the time they are outside or in a large night shed where they can walk around and be comfortable. This shed is "spotted," or cleaned out, every day. It is bedded down once a week with dry shavings and sawdust that are purchased in car load lots from a small lumber mill nearby at a cost of $40 a car. Any waste feed left in the mangers is pushed into a "junk rack" outside where there are always a few "scavenger" cows ready to clean it up and turn it into milk.

Only two cows have aborted in this herd since 1920 and both Wrage and Grewe think that these were caused by accidents. Shortly before that time they had had some breeding trouble but they started feeding a little fishmeal and iodine in the daily ration and have had no trouble since.

The concentrate mixture that fed according to Mrs. Wrage's dir tions is made up of 1100 pou wheat screenings, 550 pounds c screenings (a by-product from cra ing corn for poultry), 350 pounds a whole grain mixture of barley, o and peas, and 200 pounds of meal that they buy through the co-op.

Grain and Hay for Silage

Almost any kind of a crop is into the silo on this farm. If a sm grain gets weedy, as it often d here where they have so much ra the boys do not bother to let it ripe but just mow it down and cut up for silage. If rain comes up wet any hay before they can get cured, they cut this up too. Th started raising sweet clover for p ture in 1925 when they seeded acres. Last year they had nine. Th are getting started with alfalfa t The grass seed mixture that th were using is 3 pounds alsike, 2 tim thy, 8 red clover, and 3 of alfa This is cut for hay the first year a pastured the second.

Four acres of Golden Tank mangels are usually planted ea spring and about the same amount sweet corn. After the corn has b sold on the market the stalks are in the silos. One of the crops t is bringing in a considerable cash come is their hill selected certi Netted Gem potatoes. As they pl only from "super-hills," they have veloped a good demand for their se

Grewe Cares for Poultry

"Charley" Grewe entered the st in 1920 when he came into Snohom County as a cow tester. Both he his wife were graduated from University of Illinois, but they r like the western country better th the East. Wrage saw that his pl for the future were too large to sw alone, so he offered Grewe a partn ship in the corporation. All four p ties to the transaction are satisfied they all enjoy their own lines of w and the enterprise is making a pro

Sixteen hundred laying hens, which 1000 are pullets, are kept the Valley Gem farm and the eggs all sold through the Washington operative Egg Association. Gre spends much of his time superinte ing the poultry end of the deal, well he might, too, for the inco from the two long houses full white Leghorns is several thous dollars a year. He has had seve heavy losses of hens, but for the m part all has gone well. He has l as high as 20 a month from "bl outs" for a few months after the p lets started laying. They just r tured themselves when they were i ing to lay their first eggs. One t he bedded the houses with some st that had been baled just five days fore on a warm, damp day. It h pened that there was some act mold in this straw so when he ca back a short time later most of birds were sick and 22 of them ne recovered.

Electric lights lengthen the wo ing days for these hens and they glad to work, for their enthusia caretaker feeds them well. They h all the skimmilk they can drink there are always many bunches fresh kale or other green stuff hag ing where they can peck at it to th hearts' content.

Train Bulls to Be Driven

Much attention has been drawn the Valley Gem Farm these last years from the fact that the two uable herd sires, Valley Gem Paraq

Mixter's Senator, have been ned to work. The bulls have a ry-go-round to play with but they tired of working on this, so two s ago the boys hired Jack Fowler, famous "bull skinner" who works rm almost entirely with oxen, to e over and train these blooded to be driven. Fowler fashioned r yokes with care and soon had n pulling a stone boat as he red a highland of stones. So well he break them that the boys now them for work around the yards reference to horses as it is easier hrow the yokes over their heads to harness a team.

hen these bulls were hitched to dynomometer at the 1926 Pacific rnational, they made a tractive of 1500 pounds which is more half as much as the best heavy ht teams of horses in some states been able to make.

ving Side of Farming Stressed

any interesting things could be about this "foursome" who are ing a name for themselves with pure-bred cows, hogs, and hens, ay nothing about the selected ns of crops that are being grown. will close, however, with the re- that with all their work and y farm activities they find time to y life as they go. The gun and rod are often taken down from hooks as their owners wing the e from the woods or lure some kled beauties from a nearby m. Flowers grow here, too, and the two homes a cheery aspect, hough these couples are partners single farming enterprise, they work out the all important prob- of making a home without the e or surveillance of the other.

rm Production by States

connection with the report given here as to the total value of production in 1925 and 1926, the wing report as to value of pro- on by states may be of interest:

The Great New "62"

Great New Chrysler "62" —6-cylinder motor. 7-bearing crankshaft. 62 and more miles per hour. Invar-strut pistons. Oil filter and air cleaner. Ventilated crankcase. Impulse neutralizer and rubber engine mountings. New cellular type radiator. 4-wheel hydraulic brakes. Road levelizers, front and rear.

CHRYSLER

52 $725 to $875 — 62 $1095 to $1295 — 72 $1495 to $1745 — 80 $2495 to $3595

(All prices f. o. b. Detroit, subject to current Federal excise tax)

4 Great Cars in 4 Great Markets

CHRYSLER cars are designed and built for people who want that extra something which makes all the difference between performance and value that are merely satisfactory and performance and value that are truly distinctive.

Pick-up, power and speed that amaze as much as they exhilarate—instant responsiveness to steering wheel—brakes that positively insure safety—most unusual riding comfort—marked freedom from mechanical cares—alluring smartness of line and color.

There are four great lines to meet the four great divisions of the market—"52," "62," "72" and the Imperial "80." See them. Among them you are bound to find the car that exactly fits your needs—the car that actually provides that "extra something" at a price unbelievably low.

Couldn't Leave Mary Ann

The Mississippi flood brought some amusing as well as tragic situations. A pathetic instance was that of an old darky and his cow. Marie Mattingly Meloney tells the following story in the Philadelphia Record as reported by a young man who operated a motor boat for bringing refugees to safety:

"When we got up to the point," he explained, "we had gathered in everybody but the old man. 'Hop along, uncle,' I said, and he called back, 'Yo' all got enough room for Mary Ann?' 'Sure,' I said; 'where is she?' 'Here she is, boss,' he said, and began hauling an old cow to the boat. Well, I explained humans and cattle couldn't go in the same boats. It was orders, and I told him one of the cattle boats would be right along. But he argued, 'Boss, Mary Ann ain't no cattle. Mary Ann's a cow. She done fed all my children—she hepped to bring 'em up. I couldn't leave her in dis here mess.' "I argued with him," the youth continued, "but he would not leave his Mary Ann, and finally he said, 'Jes' breeze along, sonny, jes' breeze along; I'm agoin' to wait here for a boat that'll take Mary Ann.' So I had to leave him there; but the water is getting higher, and unless somebody can argue him out of it, that old darky is sure going to get all wet."

Within the hour, continues Miss Meloney, another life-saving boat came in with the same report about the old darky and his Mary Ann. Later a third boat brought the same news. At length a boat was dispatched on a special trip to that point of the levee, for the sole purpose of rescuing the old negro and his cow; but "long before it came back the Memphis radio station 'on the air every hour' reported, 'Water going over Milliken Bend.' Two lives had been lost," records Miss Meloney; "one was Mary Ann's."

Student—Fourth floor, please.

Elevator Man—Here's your station, son.

Student—How dare you call me son? You're not my father.

Elevator Man—Well, I brought you up, didn't I?

CHEAPER POWER

Sizes 2 to 30 H-P.

Burns Kerosene, Gas-Oil Gasoline, Distillate or Gas

Delivers power far in excess of rating on cheapest fuels. All parts interchangeable. Equipped with WICO Magneto, die cast bearings, speed and power regulator and throttling governor. Scrap your old engine—pay a little of it down on a New WITTE on my EASY PAYMENT PLAN.

If Your Dealer Does Not Handle Goods Advertised in Hoard's Dairyman—Ask Him Why!

A Compact Unit

for Washing and Sterilizing Bottles

A Real Time and Labor Saver

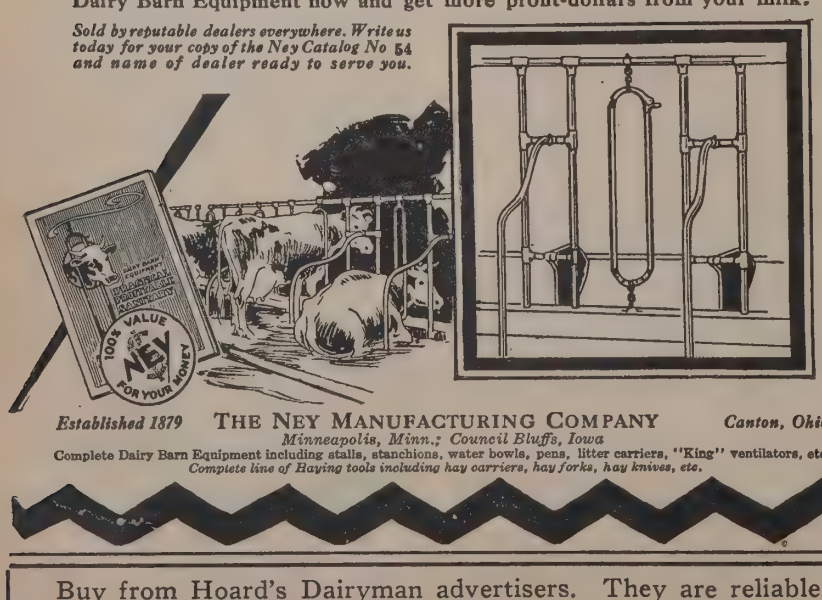
BUILD up the reputation of your product by delivering only in bottles which have been washed and sterilized in your own dairy. It pays.

And do it with the No. 9 Fort Atkinson Washer and Sterilizer shown above. Everything is handy. Without moving a step the operator stands at the machine and cleans 500 bottles or more per hour. Only one handling of each bottle. Rinsing and sterilizing practically automatic.

This is just one of the many *CP* aids to profitable dairying. We specialize in milk house equipment. Write headquarters about your problems. 320-page catalogue FREE.

THE CREAMERY PACKAGE MFG. COMPANY
1245 W. Washington Blvd., CHICAGO, ILL.

NEY



A Wise Investment That Brings More Profits

NEY Dairy Barn Equipment requires only a very small investment compared to the profits you will derive from the additional better quality milk your cows will produce.

On the basis of a ten-cow herd you can install up-to-date Ney Dairy Barn Equipment for about the price of a good radio. About quarter the cost of a cheap automobile. And the day you install modern dairy barn equipment it starts paying for itself. Modern dairy barn equipment is not a dead investment. It's a live, dollar-returning investment that will reduce your barn chores to a minimum, and save time and labor.

Many progressive farmers have paid for their Ney Equipment in a few months time from the extra milk-profits they received. Invest in Ney Dairy Barn Equipment now and get more profit-dollars from your milk.

Sold by reputable dealers everywhere. Write us today for your copy of the Ney Catalog No 54 and name of dealer ready to serve you.

Established 1879 THE NEY MANUFACTURING COMPANY *Canton, Ohio*
Minneapolis, Minn.; Council Bluffs, Iowa
Complete Dairy Barn Equipment including stalls, stanchions, water bowls, pens, litter carriers, "King" ventilators, etc.
Complete line of Haying tools including hay carriers, hay forks, hay knives, etc.

Beware the Milk House Thief

HOARD'S DAIRYMAN:—Last month a member of the Long Prairie Association of Minnesota was surprised to find that he had a milk house thief that was losing him dollars in a manner he didn't realize. The separator test read .12 of one per cent. Allowing .02 of one per cent, which is about the average test of separator milk, we still have a loss of one-tenth of one per cent. The milk sheet showed 8,000 lbs. milk separated for the month, making a loss of about 8 lbs. of fat. At 48c a pound this amounts to $3.84. If continued for twelve months, there would be a loss of $46.08, or more than enough for a year's testing dues.

Are you paying for a membership in a C. T. A. and not knowing it? Watch the cream separator. Toget with some boarder cows, it may m than eat up the profits of your g cows. Join a C. T. A.

B. J. ROSENQUIST, Teste

The "Critter" Philosophi

HOARD'S DAIRYMAN:—He was sta ing in a dark and filthy corner phi ophizing over life's strange myste His eyes were dull, his head down was in poor flesh, and covered v dirt and flies. Yet there was so thing about his appearance that m the interested observer feel that had royal blood in his veins and his early life had seen more ari cratic surroundings.

"What have I done," he said to h self. "Why do they keep me in a p like this? When I first came he was the pride of the place. I was

recall the days when everybody of my fine pedigree and future opportunities. Now it is er with; they simply call me the er.' But how do they expect me p up my vitality and prepotency ay I'm taken care of?"

Saturday he was taken to the yards and sent to Buffalo. A passed. The daughters of the old er" grew up and began fresh- You could not help but notice rge, square, well formed udders ll carried. Their looks were not ing either, for they proved to be s in the local cow testing asso- n.

guess I made a mistake by let- Old Bill go," the farmer told me ay. No one could help but con- his somewhat late conclusion, and this is not a singular or unusual case.

Why is it that the most important animal on the dairy farm is also the most neglected? Why is it that so many bulls are tied up in the darkest corners of the barns, poorly fed, and exercised only when their services are needed for the maintenance of the herd?

Much has been said and written lately about the value and importance of good proven sires. However, in order to keep up the usefulness of our good bulls, we must keep up their vitality and potency by practicing the fundamentals of any successful dairy farm, good feeding and management.

Here is a problem well worth the keen attention of the cow tester.

Michigan. HANS KARDEL, Tester.

Selling on Merit

HOARD'S DAIRYMAN:—Should a C. T. A. member sell cows on strength of records made in such an association?

This is a question that is being much discussed at the present time. During the month of August, 30 carloads of dairy cattle were shipped out of Barron County, Wisconsin, and it is interesting to note the general feeling among breeders and buyers. The breeders invariably demand more for a cow that has produced 400 lbs. fat in the year than one that only produced 300 lbs. under similar conditions, and rightly so.

The sooner our out-of-state buyers realize this fact the better off they will be. The buyer would secure higher quality, and, incidentally, this would discourage selling unprofitable animals for dairy purposes.

The idea of a breeder enrolling in a C. T. A. for the express purpose of cashing in on some high records is entirely wrong, but when combined with other benefits such as "feeding for a profit," it is undoubtedly sound. The plain fact remains that if the buyer demands quality, he can always secure it. If not, chances are he will get the scrubs. H. L. GOULD, Tester.

Cause of Trouble

"Yes," said Mrs. Newrich to the automobile salesman, "I understand about the carburetor, and all those other parts. Now please show me the depreciation. I've been told that it costs more than anything else."

A CALIFORNIA TESTER'S OUTFIT

his is the convenient arrangement devised by Mr. A. L. Kelly, tester for the Arcata ociation of California. Prior to the use of the auto he had a one-horse democrat on equipped in a similar manner. The two long boxes at the rear, one of which s on the milking machine pail, are used to hold sample bottles. He needs more uple bottles than the average tester, for in June he tested 1,418 cows in 44 herds. we look at the photograph we are led to wonder if he can empty the divided chine unit so as to keep the milk for each cow separate for weighing and sampling. owing his graduation from the California College of Agriculture, Mr. Kelly served two rs as an A. R. tester and followed this with five years as tester for the Ferndale T. A. until he took his present position with the Arcata Association last March.

The Two Biggest Things In Your Barn

STAR WATER BOWLS

Mean more milk and more money. Milk is 87% water. A cow that drinks enough gives 20 to 30% more milk. A Star Bowl gives her the water. Brass valve, can't clog or rust. Snaps shut when cow stops drinking. All working parts outside. Bowl cleaned without removing it. Fits any steel stall or wood. Works under any pressure. Detachable bowls if desired.

CHICAGO, ILLINOIS

USE FILTERING STERLING PADS FOR CLEANER MILK

GETTING THE MOST FROM MILK

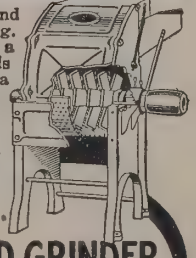
Depends on Proper Filtering !

Sterling Filtering Pads will positively remove all sediment, dirt, pollution and reduce the bacteria count to a minimum. That is why thousands of farmers are combating dirt in milk by using Sterling products and getting highest prices for their milk.

Sizes to Fit All Standard Strainers

10 DAYS' TRIAL—Ask your dealer for Sterling Filtering Pads. Use them in filtering your milk for 10 days. If you aren't thoroughly satisfied, if you do not get better results—your dealer is authorized to refund your money.

FREE -- If your dealer cannot supply you, write us at once sending us his name and we will send you absolutely free enough Sterling Pads for a thorough test.



STERLING STRAINERS are made of special design to give the maximum results in connection with Sterling Filtering Pads. Write us for prices. If you have milk problems -- write us -- we can help you.

SANITARY COTTON COMPANY

DAIRY MARKET NEWS

Feed Market Situation

(Grain, Hay and Feed Market News Service, U. S. Bureau of Agricultural Economics.)

The production of wheat feeds has recently shown a material increase in the Northwest but in the Southwest and central and southern territory production has held about steady during the past month. The increased offering of this northwestern feed has been a weakening influence in the market and bran prices at Minneapolis and Buffalo have declined $2—$3 per ton since the middle of August. Middling prices have made even greater declines, standard spring middlings now being quoted about $9 per ton lower than a month ago. Up to the present time prices of heavy wheat feeds have been unusually high as a result of a limited supply and a more active demand than usual for middlings for pig feeding. Prices now are on about the usual basis compared with bran prices but quotations on both bran and middlings are still $3—$4 higher than a year ago and apparently reflect the smaller production as a result of the dull flour demand during the early part of the present season. With a spring wheat crop more than 100,000,000 bushels larger than last year it seems unlikely that the total production this season will be any smaller than last year.

The linseed meal market has been slightly weaker in the Northwest but eastern markets continue to hold fairly steady. New crop flax is now arriving in the markets in moderate quantities and some increase in crushings has been reported at Minneapolis which has resulted in slightly larger offerings from that market and declines of about $1 per ton since the middle of August. The flax crop this year is about 5,000,000 bushels larger than last year which will provide a larger supply of meal from domestic seed. While the production of meal will depend largely upon the demand for linseed oil, the larger domestic crop may cause some change in the relative amount of meal that will be available in the western and eastern markets.

Based upon the September 1 prospects for cotton, this year's production of cottonseed meal will probably be only about two-thirds of last year's production, which totaled 2,838,000 tons of cake and meal. There were on hand at crushers at the beginning of August nearly 65,000 tons of cottonseed meal compared with about 143,000 tons a year ago. Crushings during August, however, were more than twice as large as last year, amounting to 72,659 tons compared with only 35,113 tons last year. Shipments during August were much larger than last season and were reported at 92,480 tons, leaving about 45,116 tons on hand at crushers August 31 compared with 89,711 tons at that date last year.

Hominy feed prices have been influenced more by the price fluctuations in the corn market than gluten feed. At this writing (Sept. 23) white hominy feed is quoted in the central western markets at $4—5 cheaper than a month ago.

There has been but little change in the alfalfa meal market. The supply of high grade meal is limited, choice meal being quoted about $2 per ton above No. 1 at the principal markets. Mixed feed manufacturers in the Central and Southeastern States have been active buyers at Kansas City and other central western markets and local mills at Kansas City are reported in full operation.

Quoted Sept. 22

Standard spring wheat bran: $25 Minneapolis, $28.50 Buffalo, $32.50 Philadelphia, $28.25 Chicago. Hard winter wheat bran: $26 Omaha, $25.50 Kansas City. Soft winter wheat bran: $35 Philadelphia, $32.50 Cincinnati, $28 St. Louis.

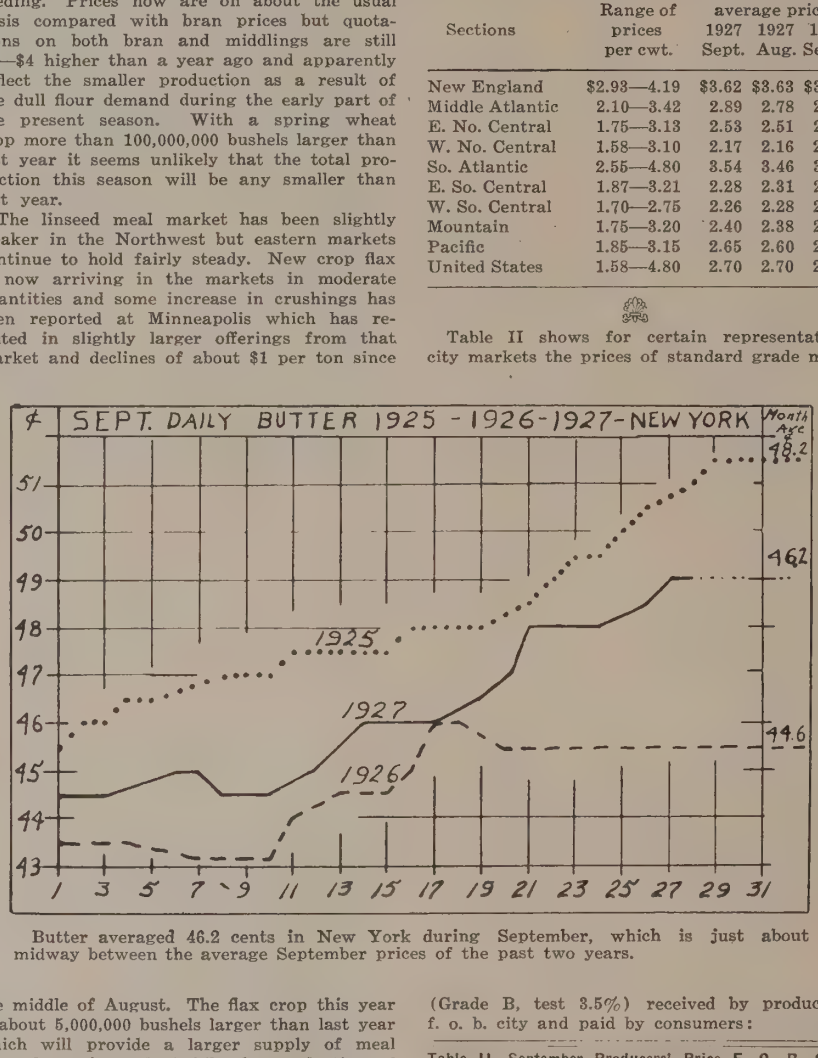
Linseed meal (34%): $47.50 Buffalo, $51 Cincinnati, $48.25 Chicago, $45.25 Minneapolis, $50.60 Omaha.

Standard spring middlings: $30 Buffalo, $33.50 Philadelphia, $29.50 Chicago, $26.50 Minneapolis. Soft wheat middlings: $45.50 Philadelphia, $41.50 Cincinnati, $38 St. Louis. Gray shorts: $35 Omaha, $34 Kansas City.

Cottonseed meal (43%): $41.50 Cincinnati, $41 Kansas City, $36 Fort Worth.

Gluten feed: $39 Buffalo. White hominy feed: $42.50 Buffalo, $37.50 St. Louis. Alfalfa meal, $26.50 Chicago, $22.50 Omaha, $23 Kansas City, $25.50 St. Louis.

September Milk Prices



(From Report by U. S. Dept. of Agriculture)

Table I represents a comparison of the net prices received by producers in 99 local markets, for fluid milk (test 3.5%) f. o. b. local shipping point or distributors' country plant:

Table I—September Producers' Prices By Geographic Sections

Sections	Range of prices per cwt.	Comparison of average prices 1927 Sept.	1927 Aug.	1926 Sept.
New England	$2.93—4.19	$3.62	$3.63	$3.43
Middle Atlantic	2.10—3.42	2.89	2.78	2.70

failure this year of the New d price control scheme,—which ted in the main of two major points: first, the fixing of prices by the control board, and second the limitation of sales to approximately a uniform amount per month,— is contrasted with the apparent success of the Australian plan which consisted of fixing domestic prices and out of this income paying an export bounty on all butter exported. A reliable report shows that by operating this scheme the producers received about two million pounds in excess of former years. The plan is voluntary and is to be continued another twelve months. Two incidents of the year's work noted are the bringing in of some imported butter to share the higher price in the Commonwealth, and the determination of the producers to secure an increase in their tariff on butter from two shillings up to six shillings per pound. It also should be said that the dry weather this past year in Australia probably was a large factor in the maintenance of the higher price, the domestic production having been reduced so that exports to Great Britain declined about 10,000 tons, or about 25 per cent from the previous year. Domestic consumption seemed to have remained at about normal levels.

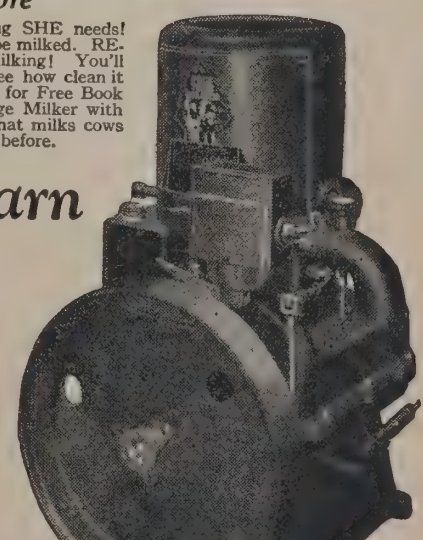
...and NOW! with the New Surge Milker

You Can Have Electric Lights In Your Barn

Four years ago the NEW **Sanitary** Surge Milker was introduced to the dairy world. Its "NO Long TUBES — NO Claws" design INSTANTLY revolutionized the industry — it swept the whole country by storm — and TODAY it is everywhere recognized as "the greatest thing that has ever happened in the entire history of machinemilking."



No more fussing over a mess of long, curling milk tubes and twisted milk claws—no more trying to clean them! No more worrying about dirty tubes and claws breeding bacteria that you can't get at—bacteria that ruin your milk! No, sir—NONE of this NOW!—with the NEW **Sanitary** Surge Milker that has NO Long Tubes and NO Claws!

Of course the NEW **Sanitary** Surge Milker is the PREFERRED milker today! Big certified farms, big breeders, and even farmers milking only eight cows have fast discarded their old machines for this NEWER and BETTER milker. ***You will, too, the minute you see it!***

Wonderful NEW Milking Method!

Milks Cows Like No Other Machine Ever Milked Cows Before

Another big Surge feature is its wonderful NEW "Surging-Tugging" calf-like action that makes even the hardest milkers give down all their milk. Some milkers suck; some suck and release—BUT—The Surge does MORE—**it ADDS the Tug of the calf!**—and like the calf tugs harder and harder as the cow milks out—AND —by a simple easy quick adjustment—you adjust it to give EACH cow JUST the exact Tug SHE needs! Each cow is milked just as she should be milked. RESULT — cleaner, faster and better milking! You'll hardly believe your eyes when you see how clean it will milk ALL your cows. Write today for Free Book telling all about the NEW Sanitary Surge Milker with its wonderful NEW milking method that milks cows like no other machine ever milked cows before.

Yessir! *Electric Lights in Your Barn*

—with the same power that runs your Surge Milker

Here's A NEW Surge achievement! NOW! —with the same power that runs your Surge Milker—and for only $75.00 extra—you can have your cow barn, your horse barn, yes, and even your chicken house, fully electric lighted. The Pine Tree Vacuum Engine will run your Surge Milker and also run the wonderful NEW Pine Tree Barn Lighting Outfit that farmers everywhere are talking about. Think what this means! No more oil lanterns. No more milking or working in the dark. Light—plenty of light — at 4 A. M. or 11 P. M. — by the same power that runs your milker. Think of it—a dependable **guaranteed** barn lighting plant—a part of your milker outfit — at the unheard of low price of only $75.00 extra!

Note: If you have electricity the Pine Tree Line of Motor Driven Vacuum Pumps means 100% satisfaction. Investigate this great line.

FREE Demonstration!

Write us now about our Free Demonstration Offer. Remember this—we don't ask you to buy ANYTHING. We want you to see and KNOW—at our risk, our expense—just what the NEW Sanitary Surge Milker and Economical Pine Tree Barn Lighting Outfit will do for YOU. You see it—Free—and then decide for yourself. Not a cent if you don't want it. You'll be surprised to see how little it will cost you —especially with our EASY TERMS, the most liberal terms you've ever heard of. Special price—if we hear from you right away!

Write for FREE Book

before Special Offer expires!

Write us NOW — before our Free Demonstration and special low price offer closes! Even though you may have no idea of buying a milking machine, if you're milking cows you should send for this wonderful new FREE book. HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

WHEN PLANTS GET SICK

YOU realize, of course, that plants get sick sometimes, just the same as you boys and girls do. When you are sick you can call a doctor. If your calf or one of your father's cows is sick, you can probably get a veterinarian to help cure the trouble. But supposing your potatoes get *scab*, or there is *smut* in the oats, or *rust* in the wheat, or *fireburn* in the orchard or your cabbages get the *yellows*, shrivel up and die, can you call the doctor to cure the sickness? All these are plant diseases and the best way to cure them is to prevent them.

SMUT MADE THE DIFFERENCE

There are the same number of oat plants in each bundle. Smut has blackened the heads and lowered the yield in the bundle on the left. Treating the oat seed before planting would have insured healthy plants like those on the right.

Now, to prevent these diseases we must know what causes them and how they spread. How many of you know what a *fungus* is? Do you know what a *spore* is? A *fungus* is a low form of plant life and some kinds of *fungi* cause plant diseases.

Mushrooms, common bread mold, cheese mold, puff balls, yeasts, mildews, rusts and smuts of grains are all fungi. Since the fungus does not have any chlorophyl or green coloring matter it must get at least a part of its food from some other plant or animal. There are two classes of fungi-*parasites* that live on growing plants. The smuts of corn and other cereals are examples of this, and *saprophytes* feed on dead plants and animals. Common examples are those fungi which cause rotting and decay.

A *spore* is not a true seed but it might be likened to the seed in higher forms of plant life because it performs the same function for the fungus, namely reproduction. In other words *spores* are the means by which fungi are spread. Most spores are extremely tiny, 5,000 of them could stand side by side in the space of one inch. Many of these spores are surrounded by a protective covering which helps them live for a long time.

You have perhaps noticed the black dust which comes from smut on corn or some of the other cereals. That black dust is composed of millions of spores. When a spore commences to grow it swells up and sends out a small bunch which lengthens into a thread, branches and rebranches until in a short time a dense network is built. This is known as a *mycelium*. New spores are formed on special upright branches on the mycelium. All these threads feed on the plant where they are growing, taking nourishment from the plant and thus making it "sick."

How do plant diseases spread? Now that you understand what makes plants sick you can readily see that many plant diseases are "catching." The spores are distributed by the wind and rain. Smut spores get onto the grain at harvest time and are planted in the spring. When the seed sprouts so do the spores. The threads grow inside the plant and when the head fills out the threads fill the kernels and form spores again.

Since the spore is at the bottom of many plant diseases you can readily see that if we get rid of the spore we can largely get rid of the disease. And the time to attack the spore is when it is on the seed before the seed is planted. Perhaps you've seen your father treating oat seed with formaldehyde solution and wondered what in the world he was doing that for. Now you know, if you didn't before, that he is killing spores when he treats his oats.

The solution is made by mixing a 40% solution of formaldehyde, obtainable at the drug store, with water in the proportion of one pint to about 40 gallons. Stinking smut of wheat, covered smut of barley, and oat smut all have a similar life story and can be treated for a few cents an acre.

Treating wheat with copper carbonate dust is a recent method that has been used with considerable success. Two ounces of dust will treat a bushel of seed grain. The dust is best applied to the grain in a closed barrel mixer similar to a hand churn. Copper carbonate dust can be purchased from a drug store and the cost of treating a bushel of seed is about 2½ cents. This treatment is put on dry, can be done at almost any convenient time, and does not affect the germination of the seed.

CORN THAT SMUT HAS MADE SICK

Smut may attack the ears, leaves, stalks, or almost any part of the corn plant. The ear on the left has been almost completely destroyed. The black appearance is caused by the spores which spread the disease.

Corn smut may develop on any part of the plant. Large boil-like structures containing masses of powdery material, spores, may form on the leaves, ears, or tassels. The spores do not live over the winter on the seed, but in the manure pile or soil, so treating the seed does little good. Crop rotation and destruction of diseased plants are methods of prevention. By rotating crops there is opportunity for the smut spores to die out.

Potato blight is a serious disease sometimes causing millions of dollars damage. The disease lives through the winter either on the seed or the vines. Along about July the threads grow very rapidly in the leaves killing the tissues. The threads branch and produce spores which blow onto other plants. There they break up into more spores that swim about in drops of rain or mist, finally coming to rest sending out their life sucking threads. How can we fight this disease? By spraying with Bordeaux mixture. Spraying is a preventive not a cure.

You have seen scabby spots on some potatoes, haven't you? The way to fight *potato scab* is to treat the seed with a corrosive sublimate solution. A level tablespoonful of corrosive sublimate dissolved in a gallon of water and this added to 25 or 30 more gallons of water is the preparation in which the seed potatoes should be treated or soaked for about an hour and a half.

The cereal *rusts* are very old. They were known in the time of the Romans. Doubtless you have seen the stems of the wheat plant covered with red spots. That's rust. Those red spots are the summer spores. Blown about by the wind they cause rapid spread of the disease through the grain field. Wheat rust later in the season forms another kind of spore called the *winter* spore which lives over winter on the straw. In the spring these spores germinate and send out other spores which are blown by the wind onto the common barberry bush which then becomes the *host*.

If the spores do not light on a host plant they perish. Spores falling on the leaves of the barberry bush again germinate, forming another type of spore called the *spring* spore. From the barberry bush the spring spores are blown back to the wheat to begin life all over again. It is also possible that rust spores may live over the winter in the summer stage by making their home on certain wild grasses.

How can we fight stem rust? Get rid of the barberry. Yes, that's very good way and in many local the government is cleaning out barberry. Rotation of crops proper drainage are other way fighting stem rust. There is still other way of avoiding stem rust that is to grow disease resistant v ties. It is known that some vari of plants are not as likely to get as others and these are often the varieties to grow.

Let us summarize the diff ways we can prevent plant dise 1, rotate the crops; 2, have pr drainage; 3, grow disease resi varieties; 4, spray the plants; 5 the spores by seed treatment; 6 stroy host plants such as the cor barberry.

The Story of My Calf

HOARD'S DAIRYMAN JUNIORS:—I came a dairy calf club membe cause I am interested in raising breeding Holsteins. I have be dairy calf club member for five y The first two years I had a grade stein heifer, while the last three have been spent in completing a calf project with a pure-bred stein heifer. The grade heifer given to me by my father.

In these two years I made showing my grade calf and thr showing corn.

I decided to buy a pure-bred h in order to get a start in the bred business.

My father and I looked at a nu of calves around Northfield, bu cided that Mr. Ovestrud had the we wanted. I borrowed $58 a bank and bought the calf. She me $125.

My heifer freshened the 8t March. She dropped a nice li calf which we are now raising this time she got alfalfa hay, silage, and ground oats and b On two-time milking she made 5 of milk a day. She was put on ture this spring with the rest o herd.

The 20th of June I took her i blanketed her. I gave her 1 daily of the following ration: 3 a each of bran, ground corn, g oats, and one part linseed meal. last month I was unable to ge corn. I fed her ground feed tw day, morning and evening. Sh plenty of fresh water and clove three times a day. She was als bedded and the barn well disinf weekly.

Mr. Byram, former agricu teacher at Northfield, visite twice. Mr. Johnson, county and Mr. Montgomery of Agricu Department at Fairbault High S also visited me. Mr. Mortenso new agricultural teacher at N field, visited me often. He also h me clip my calf.

I find that in feeding dairy the profit is greater where grown feeds are fed. The dair should be selected with care sir is the most important animal in building up the herd, since a offspring of this bull contain on of his blood. Through weighin testing your milk you can ve out the poor cows and build up of high producers.

Minnesota. LINCOLN PAUL

Our Review Column

gular feature of the junior department, ng the contents of Hoard's Dairyman previous issue. Let's talk it over.]

September 25th issue features fair reports and you Juniors can something about breed types by ng the pictures in the reports. are other interesting articles in ssue.

s it make a difference whether children drink milk or coffee? In a survey of more than 80,000 school children in Pittsburgh and Alleghany County it was found that there were more "good" pupils among those who drank only milk than "fair" or "poor" pupils, while there were more "fair" than "good" or "poor" pupils among those who drank coffee. (See page 882.)

In ten years what have the Guildners accomplished? They have paid off the mortgage on the 72½-acre farm, bought 40 acres additional for $5,000 and paid $1,000 on this. They have built a silo, a chicken house, hay barn, windmill, a garage and a machine shed and have improved the house and barn. (See page 883.)

How was the Guildner income distributed in 1925? Their gross income was $4,589.65 coming from the following sources: butterfat, $1,841.96; hogs, $1,146.29; eggs $439.98; poultry, $197.54; wheat, $181.09; miscellaneous including potatoes, $375.83.

How do European farmers use liquid manure? To fertilize their fields. All the manure including the liquid is generally collected in large underground tanks. (See page 888.)

How is it applied to the land? Generally by the use of barrel wagons. These may be pulled by one horse outfits, two-horse teams, cow teams, oxen, or any combination. A pasture on one of the Swiss farms is sprayed with liquid manure from underground pipes.

How is electricity used on the Schneider farm? On this Swiss farm, electricity pumps the liquid manure, operates the wood saw, hay and straw cutter, and feed grinder; runs the straw presser, turns the cider mill, is used in the home for heating and lighting, ironing, operating the curling iron, and toasting bread.

How should new born calves be treated? Paint the navels with iodine and dust on some boracic acid powder. (See page 890.)

How should the young boars be fed? They should have about the same combination of feeds used for gilts—green feed and limited corn supplemented with skimmilk, or a mixture of tankage 70 parts, linseed meal 15 parts, and shorts 15 parts.

What were the chief sources of Wisconsin's farm income in 1926? The gross income of $415,459,000 exceeded the 1925 income by a little over 6 per cent. Wisconsin farmers realized 47 per cent from the sale of milk, 15 per cent from hogs, 11 per cent from cattle and calves, 10 per cent from eggs and poultry, 5.7 per cent from potatoes, and the rest miscellaneous.

Junior Letters

Likes Farm Life

Hoard's Dairyman Juniors:—I am a girl 14 years old and was a Sophomore in high school last year. I live on a farm. I like calves and horses best of farm animals. As yet I have not a calf but as soon as I get capital enough I want to get a good Ayrshire calf. We have 12 or 13 cows. Sometimes I help milk.

I like to help in haying. For quite a few years I have ridden a horse to pull up the hay. Sometimes after supper I help load hay. I like farm life and all outdoors. I would like to hear from other juniors. My address is R. F. D. 1, Eagleville, Conn. Edith Slate.

A 4-H Health Club

Hoard's Dairyman Juniors:—I am a member of the 4-H Health Club which was organized at our school four years ago. We have for president, Mary Petrow. Our chairman is Edith A. Grant and I am secretary. I think it is a great thing to have some part in the club.

Our school has made health posters for four years and each year at the Storrs Fair we won a prize on them. So from all four years we have $26.75 in our bank. We have decided to visit the capital of Connecticut.

I am 12 years old and in the 8th grade. My teacher's name is Miss Cullen. She has taught me for seven years. My birthday is October 31. I have one sister and a brother. My sister goes to high school.

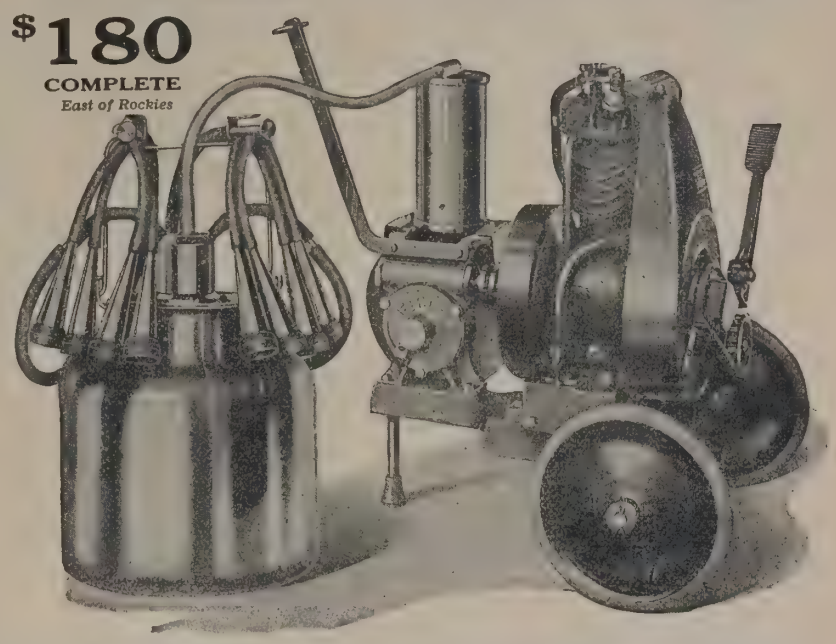
I read Hoard's Dairyman and find it very helpful in studying agriculture at school. I am corresponding with ten Hoard's Dairyman Juniors.

My address is Mansfield Center, Conn.
Olga Wanda Sulkowski.

Joins Calf Club

Hoard's Dairyman Juniors:—Dad said I could join the calf club this year. I didn't know which calf to take, so when the tester, who is the leader of our club, came I asked him which calf would be best to take. My calf's name is Kenfleur Beda's Prince. He is a Guernsey. We got him from a man in Illinois. I take him out every sunny day and give him exercise and pasture. In the morning I feed him 9 pounds of milk and 1 quart of feed. I mix the feed, oil meal, oats, and corn, and with the feed I give him a handful of silage and a little while after that I give him some hay. At noon I give him a quart of water; at night the same as morning. I am 8 years old. I would be glad if some of the juniors would write to me. My address is R. No. 3, Barron, Wis. Caryl Matthys.

From a Canadian Junior



Hoard's Dairyman Juniors:—About eight or nine years ago my father started buying Ayrshire cattle. We liked them fine so we kept on selling our Durhams and buying Ayrshires. Now we have a herd of 17 cows, 2 heifers, and an Ayrshire bull. We also have a small heifer about one week old. We always weigh the milk that each cow gives.

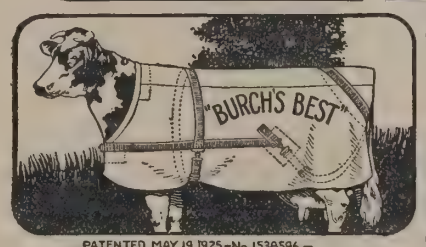
We keep six horses, four working horses and two drivers.

My address is R. R. No. 4, Mitchell, Ontario, Canada. Edwin Muegge.

Beating All Standards in Milking Machines

New improvements—easier operation—mechanical simplicity—lower price—Fords Milkers will save you 20% to 60% over any other similar milker. Why pay more?

The New **FORDS** "JUNIOR" ENGINE PORTABLE MILKER



The great popularity of Fords Milkers makes possible new and greater values. This splendid new portable model mounted on rubber wheels carries a Full Power gasoline engine. Easily started with handy foot or hand starter.

Outfit is of famous Fords Milker Quality with double milking unit, hardened bronze bushings, and New Departure ball bearings. Easy and simple to operate. Thousands in successful use—completely guaranteed. Some territory open for distributers.

Does better work—Lasts longer and costs less. Write for Free Booklet No. 20

Simmons, Louis Jacobi, Oakley Frost, Norman E. Wood.

Vermont Experimental Farm

HOARD'S DAIRYMAN:—As a result of a bill recently passed by the legislature, the Vermont Experiment Station is to receive an appropriation from the state for the purpose of operating the dairy farm. This is the first opportunity that the experiment station has had to operate the University Farm.

M. H. Campbell has been added to the staff of the Department of Animal and Dairy Husbandry as professor of dairy production. He will have direct charge of the dairy herd and farm as well as doing instructional work.

Professor Campbell was raised on a dairy farm in Illinois. He attended the University of Illinois, specializing in dairy production work. After graduation he spent one year in graduate study at the University of Wisconsin. He became a member of the Department of Dairy Husbandry at the University of Illinois in 1918 where he remained until coming to Vermont. While at Illinois he had direct supervision of the college herd and was superintendent of official testing. Vermont is fortunate in securing Professor Campbell.

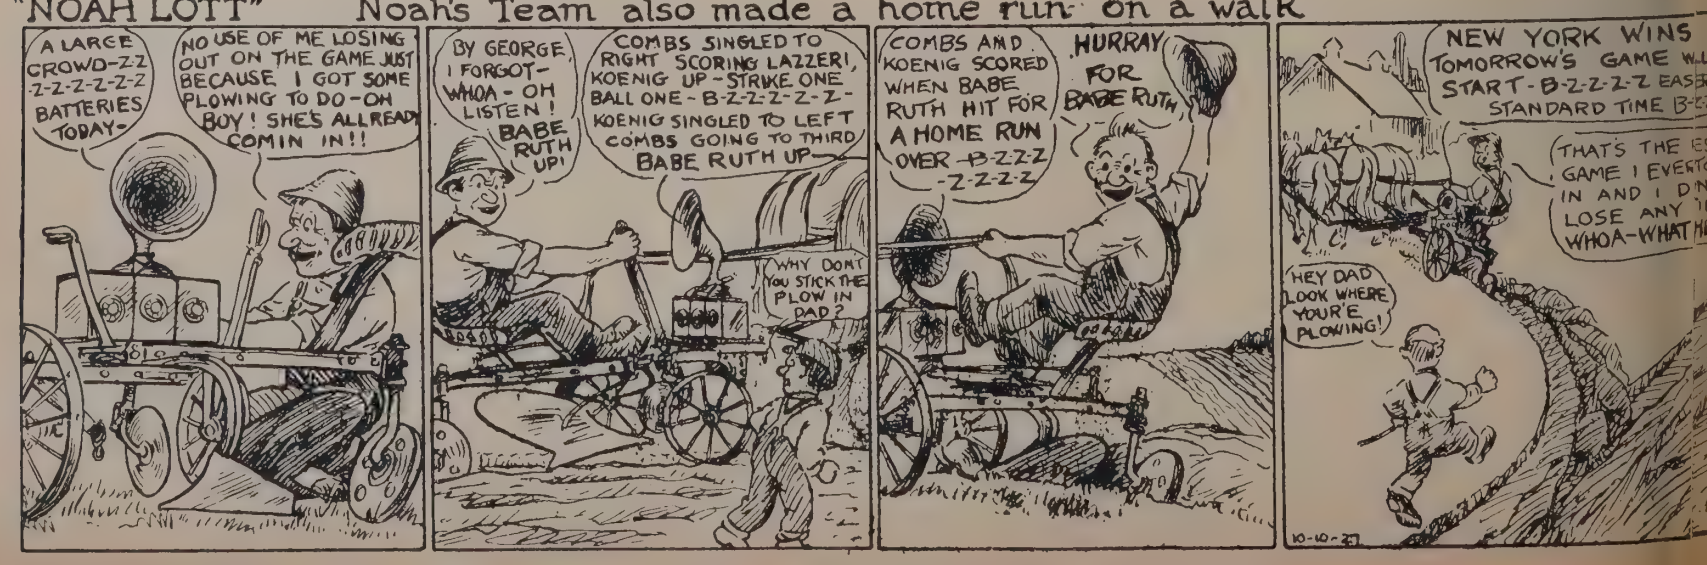
H. B. ELLENBERGER.
Vermont Experiment Station.

Cows in Labrador

Even in far off Labrador, where Dr. Wilfred T. Grenfell has made himself famous for his medical care of the Eskimos, Dairy Council literature finds a valuable place in a health education program.

For many years the National Dairy Council has been supplying the International Grenfell Association with material which could be used among the children of Labrador. This year, however, an entirely different set of Council literature was prepared and sent up to meet the demands of the Yale School in Labrador, located at the North West River.

While it was the first year for this icebound school, and although the youngsters were housed in rather poor quarters with equipment of the rudest sort, yet the boys and girls of Labrador learned to love to go to school and were given a slight insight of the opportunities that education can offer.



Miss Elizabeth Criswell, Child Welfare Director of the Yale school, brought two cows with her to provide fresh milk for the boarding house of 14 children taken in from outside settlements. Few of these children had ever tasted milk before, and none of them had ever had fresh milk.

"It was a delight," states Miss Criswell, "to see these youngsters gaining weekly from their daily ration of milk. One boy gained 16 lbs. during the year; everyone gained from 4 to 16 lbs. And not only have the boys and girls learned to like and to know the value of milk but they have learned to love, care for, and want cows.

"It is difficult for us to understand that these people have never known domestic animals, outside of the half-savage husky dogs that furnish transportation for them. Care of the dogs involves little work; but the boys in the school regard the tending of the cows seriously, carefully watering, feeding, and milking them. When the calves came this spring, each one was bespoken many times. Our greatest problem now is to secure c a reasonable rate which these can afford.'

Ran Out of Hay and Bo Alfalfa

It is interesting to talk with men about the influences tha up to their getting interested in alfalfa to give it a trial. Ralph Meyering of Missaukee (u Michigan, for example. Ralp first persuaded to put his her cow testing association. Abo time he found out there was thing to it and began turning f poorest producing cows, he ered that good cows must be wl He ran short of hay, such as two winters ago and bough shipped-in alfalfa at a price than he had ever paid for ar This hay was so much better th kind of hay he ran out of that next to the county agent a "wised up" on how to grow Now he is growing his own. that selling home grown alf his good cows is a mighty go to keep ahead of the sheriff.

New Book on Butter

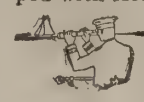
The second edition of "The Butter Industry" is ready for distribution. The book has been completely rewritten and numerous chapters on many phases of butter manufacture have been added.

Professor O. F. Hunziker, the author of this book, is a thorough student of butter manufacture. He understands the science and the practice of buttermaking and his book is prepared for those who desire the best and latest information pertaining to the butter industry. "The Butter Industry" may be obtained from Hoard's Dairyman Book Department, for $6.50 in the United States and $7.00 in foreign countries.

At least twelve winners in dairy calf work in Minnesota will be sent to the National Dairy Exposition at Memphis, Tenn., October 15—22, by the Minneapolis Journal. Club winners from 28 states will participate in the contests.

The greatest radio value the world ever saw. Six-tube Bandbox $55

To Crosley resources, experience, leadership and mass manufacturing methods comes the big factor that leads to paramount achievement—license to use the best of radio patents—license to work with and to take full advantage of the research and study of the greatest of their kind—The Radio Corporation of America, The General Electric Co., The Westinghouse Co., The American Telephone & Telegraph Co., and The Hazeltine and Latour Corporations.



Wonder not then that this "Bandbox" is an amazing radio—and a phenomenal value.

Such resources at his command have resulted in the greatest Crosley triumph—a 6 tube receiver with all elements Completely Shielded—absolutely Balanced in its radio frequency stages and including features and refinements at a price of $55, which are the chief talking points of sets twice its price and more.

This Bandbox is totally shielded. Copper shields cover coils, cadmium-plated steel covers the condensers. Wiring is completely shielded from both. The Bandbox is completely balanced. It is a genuine neutrodyne.

The Bandbox is equipped with Acuminators—secondary adjustments to be used only on weak, distant signals and when cruising for far-a-way stations that ordinary one dial sets miss entirely.

The Bandbox possesses a volume control by which strong local dancing volume can be reduced to a whisper without distortion of detuning.

The Bandbox operates with a single tuning knob which turns an illuminated dial. This feature for shadowy corners is greatly appreciated.

The Bandbox is easily installed in console cabinets being so designed that a few screws removed from the escutcheon and the bottom releases chassis from the outside metal case. See it at Crosley dealers now!

Approved Consoles

Selected by Powel Crosley, Jr., as ideal, acoustically and mechanically for the installation of the Crosley "Bandbox." Genuine Musicone built in. Crosley dealers secure them from th ir jobbers through

Corn Borer War Continues

War on the European corn borer continues. The fall attack is under way.

The corn borer is advancing. This pest has been reported in 55 Ohio counties as compared to 42 counties last year. In Indiana 14 counties have reported the corn borer where only 8 counties had it last year.

"Cutting corn low is the first move against the borer in the fall," say authorities at Ohio State Agricultural College. The worms move down in the cornstalk as the season advances so that corn cut low and disposed of early in the season will get rid of most of the borers."

In all of the 55 infested Ohio counties low cutting demonstrations will be conducted this fall by extension officials of Ohio State University. A 4-page leaflet on harvesting methods to control the borer can be obtained by writing Ohio State University at Columbus.

Production and Uses of Milk 1925—1926

(Continued from page 927)

Cheese consumption in 1926 amounted to 4.36 lbs. per capita, a slight increase over 1925 and nearly a pound and a half increase over 1917. This is equivalent to a per capita increase of nearly 7 quarts of milk in the past nine years. There is opportunity to promote larger consumption of cheese in the future, for its economy and palatableness warrant a consumption double what now prevails.

Condensed milk consumption amounted to 14.32 lbs. per capi 1926, a decrease of half a p from the previous year but a crease of 3.83 lbs. over 1917. is equivalent to an increase of n 4½ quarts of milk in nine year

Ice cream consumption was gallons per capita in 1926, a decrease from 1925 but an inc of 2.8 quarts over 1917. Th equivalent to an increase of n 4½ quarts of milk in nine year

Table V—Per Capita Annual Consur of Dairy Products in United State

Year	Milk	Butter	Cheese	Condensed milk
	Gals.	Lbs.	Lbs.	Lbs.
1849		13.9	4.0	
1859		15.1	3.2	
1869		13.7	3.3	
1879		15.8	2.1

1925	54.75	17.39	4.26	14.87
1926	55.30	17.82	4.36	14.32

*Including cottage cheese, not inclu other years.
†For the year 1910.

Monthly Uses of Milk

The following table shows t rying quantities of milk used month for the manufacture four principal dairy products in as also the monthly percentag the year's total for these four ucts:

Table VI—Milk Used in Manufactu 1926
(In millions of pounds)

	Butter	Cheese	Condensed milk*	Ice cream
	Lbs.	Lbs.	Lbs.	Lbs.
Jan.	2,060	251	311	110
Feb.	1,984	251	289	119
Mar.	2,367	317	362	157
April	2,555	369	410	204
May	3,292	488	518	342
June	3,763	576	582	383
July	3,357	495	468	504
Aug.	2,808	414	348	441
Sept.	2,460	363	298	280
Oct.	2,171	307	273	178
Nov.	1,865	227	222	127
Dec.	1,917	210	246	107
Total	30,604	4,274	4,333	2,959

*Includes evaporated milk.
†Per cent of total milk used mon all four products.

Starting with their lowest p production at the beginning year, each of these four m tured products reach their g volume in June, which mor counts for one-eighth of all mi for manufacturing purposes. August supplies 44.5% of the factured dairy products.

Balance of Trade

While we exported over fi lion pounds of butter in 1926, ported sufficient to make the ports total 2,546,075 lbs. manner we find net imports of amounting to 74,514,226 lbs. net export of 112,885,601 lbs. densed milk. Reduced to thei milk equivalent, the total o three products represents a port of over half a billion po milk, the largest import ever ed. There was a net export for the war and post-war y 1918 to 1922. Although the port for 1926 looks large, it a to less than one-half of one p of our total milk production.

(EDITOR'S NOTE: In prepari survey, we are largely inde the Bureau of Agricultural Fo ics, and especially to T. R. P that Bureau.)

Smoke Camels for the one big reason . . . enjoyment!

WHY do people like good tobaccos? For just one reason — enjoyment. And Camel brings this world more tobacco pleasure every day than any other cigarette that ever was made. That's why the number of Camel smokers is the largest in the world. Why Camel gains in popularity every hour.

If you want the sheerest pleasure that wonderful tobaccos can give, just try Camels. So mellow and mild you'll wonder how you ever got along without them. So smooth and fragrant that they will reveal a smoking contentment that is full and complete.

We invite you to know Camels because they are so good. This famous cigarette will repay you in full measures of genuine enjoyment. Camel leads the world!

Seasonable Live Stock Notes

CTOBER is a glorious time of year. Following harvest and preceding Thanksgiving it s a measure of the season's labor of the use of land; it brings a -colored horizon among trees gratitude at the hearthstone. s, bins, stacks, and silos now the season's harvest. We turn the toil of the field to that of replenishing feed boxes; we to make feeds and begin to foods—the products of good tock husbandry.

Udder Trouble Treatment

sh cows, particularly well-fed producers, frequently have con- n or inflammation of the udder. r such cases could be prevented eatly modified in their severity oser attention to feeding for the week or so after cows calve. A practice is to cut down the nt of grain fed and substitute a laxative in nature and light in cter. Bran is especially good at a time. Some ground oats could lded with bran. Milk should be n several times daily followed time by rubbing or kneading the lammation induced by garget or mitis infection is of different cter than congestion. Grain ng should be reduced; a physic d be given; affected cows should e exposed to inclement weather. should be milked gently three ur times daily. Affected cows d be isolated to prevent unaffect- ws being exposed to the disease is somewhat transmissible.

Mangels

e feeding of freshly dug mangels ge quantities frequently induces s. To safeguard the possibility is, the beets should be stored for al weeks before feeding. In ng mangels there is less likeli- of imparting undesirable flavors ilk if they are fed immediately milking rather than before milk- Kale and rape are two succulent most likely to impart undesir- flavors to milk if fed within two before milking.

Fitting for Test

ws that are to be started on test this fall and during the winter d be dried off soon enough as to them about eight weeks of rest. that are just finishing year rec- should have the full time rest; that are in fair to good condi- may not need the full eight s to get them in proper condi- Cows to be put on short time should be fat at calving time. ssive fattening is not so essen- when cows are to be carried gh for the longer testing peri- The fitting ration should include culent feed and a grain mixture. oughage, silage and legume hay a very good combination. Beet pulp or stock beets may be used in place of part of the silage. Many herdsmen have their own special grain mixture for fitting. Following are two good grain mixtures to be fed with silage and legume hay: (1) 100 lbs. each of bran, ground oats, hominy feed or ground corn, linseed meal; (2) 100 lbs. each of bran, ground oats, linseed meal, 75 lbs. cottonseed meal, 50 lbs. ground corn.

llia has recently completed a record 6,434.3 pounds milk containing 981.7 ds fat. She thus becomes the tenth est cow for the Guernsey breed in A (mature). Mallia was bred and d by Howard B. Tuttle of Connecti- —American Guernsey Cattle Club.

Feeding Calves on Milk Substitutes

The problem of feeding calves in herds from which whole milk is sold is by no means an easy one to solve successfully. Experimental evidence indicates that calves must be fed whole milk at least 20 days if they are to survive changes to substitutes. Calves fed on substitutes usually do not look as well as whole milk fed calves for the first 6 to 9 months. Thereafter they recover from the deficiencies of their earlier feeding.

Some good calf meal mixtures are as follows: equal parts by weight of hominy feed, linseed meal, red dog flour, and dried blood mixed with water in the proportion of 1 of meal to 9 of water and fed warm, 100° F. Dry grain, ground corn and oats, and legume hay are to be fed in addition to the gruel.

The New York Station recommends a calf meal mixture as follows: 500 lbs. yellow corn meal, 440 lbs. red dog flour, 300 lbs. oat flour, 300 lbs. linseed meal, 200 lbs. malted barley, 200 lbs. soluble blood flour, 20 lbs. each of calcium carbonate, steamed bone meal, and salt. This mixture is fed as gruel at 100° F. mixing with water in the proportion of 1 of meal to 5 of water. Whole milk is fed the first 20 days and thereafter the gruel substituted gradually. At three weeks of age hay and grain should be placed before the calves. Legume hay and a grain mixture composed of 30 lbs. each of hominy feed, ground oats, and wheat bran, and 10 lbs. linseed meal are recommended.

Weaning Fall Pigs

Weaning pigs with the least disturbance to their continued growth is an art well worth learning. A very successful Indiana hog raiser provides a creep and suitable feeds for pigs while they are still nursing their dams. At eight weeks of age the sow's feed is gradually restricted which shuts down on milk production. When the time is right, the sows are taken away from the pigs and not the pigs from their dams. In this way by leaving the pigs in the quarters they are accustomed to they are weaned without knowing what has been done.

Preventing Egg Losses

The season is near at hand for converting feed crops into eggs. No one wants to put labor into the production of feeds and then lose their value. It is estimated that about 17 per cent of the eggs shipped to wholesale markets have no commercial value because of their being dirty, broken, or having chick development, or being shrunken, rotten, or moldy. The following conditions will almost entirely eliminate losses from these sources: eggs for market should weigh from one and one-half to two pounds per dozen; be uniform in size; be free from dirt, but not washed; be strong shelled, fresh, and infertile. They should be laid in clean nests, gathered often, never taken from an incubator nor from stolen nests; they should be kept in a cool, dry place until delivered at the market.

Make the most of Winter Milk prices

Here's your opportunity to cash in on winter milk prices. Make the most of this season's market by getting your production on a sound, economical basis. There's a Quaker Dairy Ration that just fits your farm, your herd! Pick your feed below:

Feed the Feed that Fits Your Farm, Your Herd!

Quaker Boss Dairy Ration is the ideal **24%** grain ration for cows receiving timothy hay, grass hays, straws, corn stover, or poorer grades of clover.

Quaker Big Q Dairy Ration exactly **20%** meets the need of those herds receiving poor alfalfa hay, fair clover hay, or real choice mixed clover and grass hay.

Quaker Dairy Ration has no superior **16%** when cows are receiving choice clover hay, good alfalfa hay, or an excellent grade of fine mixed grass-and-clover hay; a good ration for dry stock and for young growing stock.

Quaker Sugared Schumacher Feed, as the exclusive grain ration has a real place when the herd is receiving liberal quantities of the very best grade of alfalfa hay. For blending it combines beautifully with any Quaker high protein feed. For all stock—dry stock, horses, sheep, swine, and steers it is unexcelled.

All Quaker Dairy Feeds contain molasses in dried form and are rich in the minerals cows must have to make milk.

Send for the FREE book—"The Dairy Herd"—it tells you just how to meet the feed requirements of your farm, your herd.

Ward Off Winter Diseases!

Cold, damp stall floors are frequently responsible for garget, rheumatism and other cold-weather diseases that decrease milk yield. Insure the health of *your* herd this winter and increase milk production by flooring your stalls with warm, comfortable Circle A Cork Brick.

Circle A Cork Brick are *warm* because they are seventy per cent cork by volume—*dry* because they are thoroughly nonabsorbent of moisture—*safe* because they are nonslippery. They are so reasonable in cost and so sound an investment that no dairyman can afford to be without the protection they afford.

Write for a sample brick and book, "Circle A Cork Brick." Address ARMSTRONG CORK & INSULATION COMPANY *(Division of Armstrong Cork Company)*, 112 Twenty-fourth Street, Pittsburgh, Pa.

Circle A Cork Brick Floors

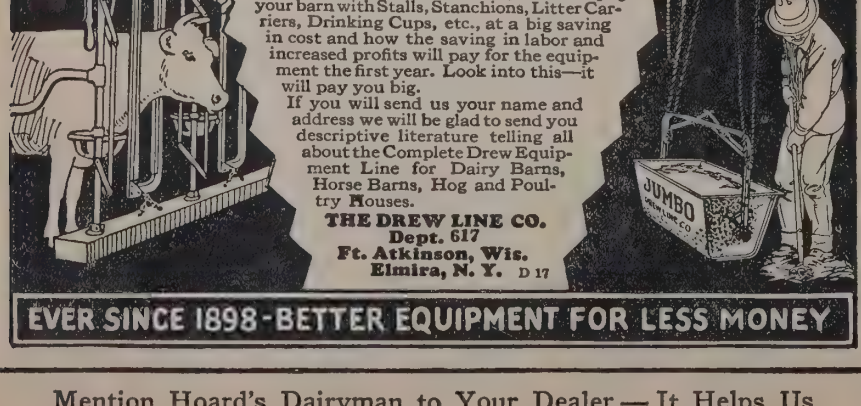
For Dairy Barns and Hog Houses

THE DREW LINE

New Low Prices

On Better Barn Equipment

For 29 years the Drew Line of Barn Equipment has offered farmers and dairymen more dollar for dollar value than they could get in any other equipment.



Now at our New Low Prices you have an opportunity to make a still greater saving. There has never been a time when farmers have had the opportunity to purchase barn equipment at prices that would enable them to realize as great a profit on the investment as they have right now!

Before You Buy See the Drew Line Dealer

He will gladly show you how you can equip your barn with Stalls, Stanchions, Litter Carriers, Drinking Cups, etc., at a big saving in cost and how the saving in labor and increased profits will pay for the equipment the first year. Look into this—it will pay you big.

If you will send us your name and address we will be glad to send you descriptive literature telling all about the Complete Drew Equipment Line for Dairy Barns, Horse Barns, Hog and Poultry Houses.

Mention Hoard's Dairyman to Your Dealer — It Helps Us

Opinions, Brickbats, and Bouqu

These columns are open to the readers of Hoard's Dairyman for the expressio their opinion on any subject, whether radical or conservative, destructive or construc wise or foolish. It may be cows or crops, religion or politics, or what at the time r interests you. It may be critical or commendatory, but it should be your opinion. your own editorial page but your editorial must not exceed 250 words. Hoard's Dairy assumes no responsibility for opinions expressed.

Believes in Co-operative Marketing

HOARD'S DAIRYMAN:—I always enjoy your editorial page; however, the August 10 is better than usual. As I am primarily interested in co-operative farm marketing and its success I especially appreciate your article on that. I feel that our Missouri Farmers' Association has undertaken as large a task as any farm organization and has been exceptionally successful with poultry and eggs, and in a small way with cream. The high lights in success as I see them are not so much in price fixing as the increase of sales and the steadying of prices.

The Ozark country is an ideal poultry country. Before the organization of our M. F. A., egg prices fluctuated from 10 or 12 cents in summer to 60 or 65 cents in winter, with the low price during the heavy production time and the high price when very few eggs were being produced, and now by using our own cold storage the low price has been around 20 cents and the high price around 40 cents, with the profit to the producer almost doubled and yet leaving eggs at usable prices for the consumer. Probably their best work has been in grading eggs and in working for better grade of cream. We have also saved by purchasing feeds and seeds in a more economical way and there is much room for improvement yet. There has also been quite a nice little dividend to be pro-rated back to the producers. I still believe in co-operative marketing as the best bet for communities which specialize in any line but more for the purpose of stabilizing prices and quality and increasing consumption than to try to boost prices. I also believe in trade unions but think they should be used more to increase the quality of labor than they are at present. Any organization that starts in to rob the other fellow is going to get a black eye soon but organizations to deliver better goods at living prices or honest work at living wages are bound to succeed because they are right.

Thanks for your good paper.

Missouri. H. L. EDGERTON.

Arizona's Future

HOARD'S DAIRYMAN:—It is with keen interest that I have read your editorial on the subject of "Why More Land?" and the subsequent discussion of this topic. Naturally everyone should be in hearty accord with any move toward the elimination of unprofitableness from agricultural land.

Doubtless in many sections of this country there are to be found numerous farms which would be a greater asset to the nation for growing timber rather than serving to bankrupt, if not entirely starve out, some poor mortals who are trying to till such soil. However, here in Arizona a very different condition exists. Our leading industry is mining. As everyone should be aware, it is but a matter of time until the ores from these mines will be depleted. Then, unless we can turn to some other resource, the fate of Arizona will eventually be similar to that of Nevada—once wealthy, now poor.

Fortunately, however, we believe that reclamation of agricultural lands from the present desert will be our salvation. We are looking fo to the time when a gigantic s dam will be built at Glen Cany the Colorado river from which, led with proper diversion and veyance of water, 3,000,000 ac highly productive land can be i ed. Of course, several years required to complete this vas ject; its development being so al that no additional burden t sent overcrowded markets will fected.

In this section of the U. S. have little apprehension of ov duction. The rapidly growing cities already are on the po needing market milk from A while across the Pacific the cr and undernourished populace Orient will ever urge a conti of our efforts. In fact, a l world demands that, instead following that narrow idea of tailment of production, we rather work for the boarder po perfecting a plan whereby ou cultural surplus will be absorbe world market.

Arizona. J. IRVIN B

Where the Fault Li

HOARD'S DAIRYMAN:—I grow at times of reading about agric conditions and methods prope improve them. It would be a person, indeed, who did not app that there are large opportun increase the income of farme me this is not going to be plished by outside agencies or political party.

The destiny of agriculture is hands of the people who live land. They need to be betr ganized, and would be if a majority saw its value and leadership could be secured. O son why we do not have mor bers in our various farm ora tions and that our leadership more capable is due to the fa persons do not become enth over what is possible to acco The advocacy of things im strikes the imagination and c more enthusiasm than simple plans and practices which wou an industry upon a proper ba

People like to dwell in dre and paint fairy pictures. It that humanity has this trait. lead it away from the beaten t every day work and into new takings. Without this trait hu would stagnate. The thing I co about is that they carry it too forget that when dealing with cal problems of life and layin for the development of an indu is the commonplace things th be brought into coordination i ress is to be made.

If we could organize and de plan for securing accurate an marketing information concer farm crops and such other i tion as is essential to the pre for marketing, and could estab operative enterprises for pr and marketing farm product would be no need of any speci lation to solve the problem of ture. We are not going to mak progress with this splendid id of ours until we fully appreci we must utilize the princip practices that other industri followed and used.

aged cow class with its eleven was something of a disap- nt because there wasn't a tstanding show animal in the only a few good ones. The one me nearest filling the bill was tis owned by Warren Kinney. a good bodied cow with a fair ut she isn't too good behind the shoulders nor at the tail setting. There was nothing better shown in the succeeding classes and she won senior and grand championship handily.

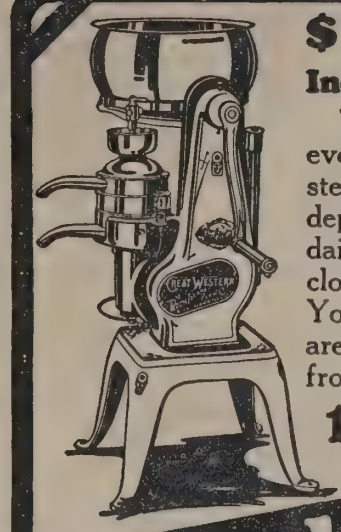
Zoller entries were good winners in the next three classes: 3-year-olds, 2-year-olds, and senior yearlings, but the judge went on down the line for a junior champion and found her in Hull Bros.' winning calf, Carl's Valley Girl 10th of Lake View.

The get of sire class was an easy win for J. F. Zoller who showed four by Vronicka's College Boy. In the group were the grand champion bull, the fifth place cow, and the second and third prize senior yearling heifers.

The Holsteins

Judge: W. S. Moscrip, Minnesota

The Holstein show this year wasn't so good as it has been for the two years previous, nor was it so good as it should have been. It ought to have been larger and while the tops were very acceptable, there could well have been better ones on down the line in most of the classes.



The 150 head shown represented 21 herds in New Hampshire, Connecticut, New York, Massachusetts, New Jersey, Ohio, Pennsylvania, and Illinois. Elmwood Farm of Illinois was the heaviest winner with ten blues and three of the four champions.

A good bull headed almost every class but there were just two really outstanding ones, Sir Fobes Ormsby Hengerveld shown by Elmwood Farm and Hurlwood Sir Segis Walker, a senior yearling owned by Hurlwood Farm and T. S. Gold. The older bull, grand champion everywhere and All-American last year, may perhaps not show quite in the bloom of a year ago, but he is certainly far and away the best aged entry out this season and was an easy senior and grand champion here.

The yearling, a junior champion here in 1926, has developed nicely since and quite deserved his junior champion ribbon this year. He is, we think, the best junior bull we have seen up so far this year.

Among the 15 aged cows was one that very well suited Judge Moscrip. Colantha Hark Delaphene is a big, straight topped, square rumped cow of typical Holland type that carries her 12 years easily. A few of the ring-

Increases Your Daily Harvest

There is one crop you harvest every day—your milk crop. It is a steady source of income and its size depends not only upon the number of dairy cattle you have, but also on the close skimming of your separator. You can feel absolutely certain you are getting every bit of butter fat from the milk if you use a

1928 Model

Rock Island

"Great Western" CREAM SEPARATOR

Noted for its thorough skimming—the feature which determines the extent of your profit.

With the Rock Island skimming device you take advantage of the law of gravity. It assists you in the job of skimming, because the Rock Island works in the most natural way, the cream going up through the upper outlet and the skimmed milk down through the bottom outlet. Bottom outlet for skim milk makes a self-draining, easy-cleaning bowl.

Low, swinging supply tank is easy to fill. Convenient crank, ball-bearing construction and self-oiling make it easy running. All moving parts enclosed.

Free booklet tells why the Rock Island gets all the cream. Write today for free booklet C-103.

Save $15.00 to $25.00 per Ton Grinding Your Own Feed With

"JAY BEE" Humdinger

CRUSHER · GRINDER · PULVERIZER

The Old Reliable "Jay Bee" feed mill is the greatest money-maker you can buy. Mills have paid for selves in a single year. 3 sizes: 7 H. P. to 30 H. P. to meet your exact needs. Fordson will operate successfully.

It Has Never Failed Me — Not a Dime for Repairs

Mr. S. Shipman, Guide Rock, Nebr., says: "My Humdinger has never failed me. I have ground more than 15,000 bushels of corn and at least 400 tons of hay and fodder, and haven't spent a dime for repairs yet."

Cool Grinding — Makes Better Feed

The "Jay Bee" does not heat the feed. Grinds any grain or roughage UNIFORMLY, finer, faster, at less cost per ton than any other mill.

Over 7500 "Jay Bee" Mills in use. There's a reason. It's the best mill — cheapest when work is done.

Yeoman Farm, Elgin, Ill. (dairy barn illustrated above) made better feed at less than $35 per ton, with their Humdinger Mill, than they bought for $60. So can you! We will tell you how. Emil Westergard, Omaha, Nebr., milking 47 cows, saved $150 a month on his feed bill. This saving paid for Humdinger, tractor, belt, pulley, in one season.

First Cost is Only Cost

The Only All-Steel Hammer Mill

J. Dickson, Mgr. Thos. E. Wilson Shorthorn Farm, Lake Co., Ill., writes: "We have used a 'Jay Bee' Humdinger for three years, and the first cost has been the only one with us. We grind about 20,000 bushels of corn, oats and barley each year, as well as all the alfalfa hay fed to the cattle. The mill is truly a 'Humdinger.'"

Farmers have good reasons for preferring RED TOPS

RED TOP POSTS make fencing easy, economical and profitable

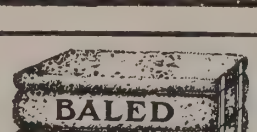
EASY—because one man in a single day can do the fence job that formerly required two men a week—when post holes had to be dug.

ECONOMICAL—because they outlast four or five ordinary wood posts. Save the cost of time and labor usually spent each Spring in repairs, replacements and restapling. Lengthens useful life of your fence.

PROFITABLE—because only good fences can make the new farming system of crop and stock rotation profitable. Build good fences on RED TOP Steel Fence Posts.

Red Top GUARANTEED **Steel Fence Posts**

WHEN you buy a steel post, why experiment? RED TOP is the pioneer. It has earned its leadership through its service record in the fence line for many years. It is guaranteed. RED TOP has satisfied the hardest and most critical buyers of fencing material. Millions are to be found in all sections of the country. Railroads use them extensively. One of the heaviest purchasers of RED TOP has been the United States Government. Use only fencing materials that are known to be durable. In the long run they are the cheapest.



Ask Your RED TOP *Dealer*

He will show you in an actual post the differences that make it the best for you to use. The fact that he handles RED TOPS indicates that he is not only an authority on fencing materials but also on how the proper and timely use of fencing will turn waste into profits.

Watch Our Special Opportunities Page for Real Farmers' Bargains

Factors Affecting Profit

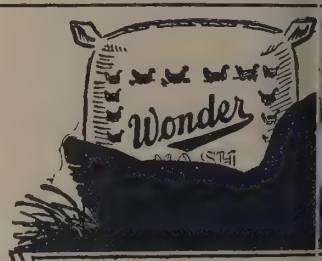
Two important factors enter into a discussion of poultry profits. One is the number of eggs a fowl produces and the second is when those eggs are produced. There is no questioning the fact that the number of eggs a hen produces will determine the cost of producing the eggs but the time of the year they are produced determines the profit of the year.

An interesting side light on this second factor was noted in the production of about 250 flocks during the month of January. In determining this feed cost only the cost of feed was considered. No consideration was given to mortality, depreciation, labor cost, interest, taxes, or the other items that should be considered in determining the cost of production. All that one can get from these costs is the comparative cost as determined by production.

All the flocks were divided into four classes as based on production. The production was based on average egg production per hen per month rather than per cent production. This method of determining production gives one a more concrete idea than just percentage:

Production per hen	Average for month	Feed cost per doz. eggs
eggs	eggs	cents
0—7	4.14	45
7—10	8.54	21
10—15	12.13	14
15—20	16.76	12.5

It is clearly evident that volume of production is required to enable one to produce efficiently. This is true because about the same amount of feed is required to maintain a fowl when producing or not producing. Only a slight excess is required to produce over what is demanded only for maintenance.

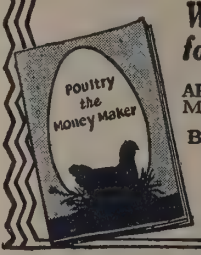


The second factor that enters into the consideration is that of distribution. An attempt must be made toward making egg production more nearly a year-round proposition. With the present arrangement we find that there is a high percentage of eggs produced during the spring resulting in low egg prices and a low percentage in the late summer and fall causing high prices. One should try to fill in the two dips that are found at either end of a production curve. It can be improved by proper management.

Data from a recent Maine publication shows the following interesting table of a comparison of monthly production and average price:

Month	Av. price eggs per doz. cents	Av. No. eggs produced Old hen flock	All flocks	Pullet flock
November	67	2	3	8
December	65	2	6	10
January	48	3	8	11
February	41	5	9	11
March	33	18	15	16
April	27	14	16	17
May	27	14	15	17
June	28	13	13	14
July	32	12	12	14
August	38	10	11	12
September	47	7	10	10
October	51	6	7	8

There is, of course, a high[er] production for the pullet flock th[an] was for the old hen flocks [in] with this fact in mind one [can] that there was a higher pr[ofit] from the pullet flocks dur[ing] months of September, Octo[ber], vember, December, and [January]. There is a greater tendency f[or] form production from prope[r] tured pullets during that per[iod] there is from hens. One wil[l] smaller fluctuation between [the] winter yield compared to spr[ing] summer than there will be wi[th] The same thing is true in co[m]bining a good flock with a poor flo[ck].



In another way one can s[ee] following difference between [the] flocks. The pullets showed [an] vantage per individual of the[se] ing amounts: September, 11 [cents]; tober, 8½c; November, 33½ [cents]; cember, 48¾c; January, 36 [cents]. meant a total income of $1[.]

ducing quality, well bred
one can obtain reliable chicks
time of the year that he de-
em.
ling practices have been per-
o a point where the mortality
low and the cost of maturing
is consequently lessened. This
of poultry keeping is very
approaching a factory method
justified. This is not offered
suggestion but rather as a
to be given some considera-

same publication gives the fol-
table on the effect of number
ets on egg production and re-

n of ck	No. eggs per hen	Labor income per hen	per hour
%	98	$1.57	$.41
%	124	2.52	.58
)%	133	3.01	.71

n this one will note that as the
ion of pullets in the flock in-
, the average egg production
labor income increased. This
because the egg production
he pullets was higher and the
tion was obtained during the
of higher prices. These are
that must receive some consid-
at this time when a person
ning the operation for the next

e are a number of people at
ne, under farm conditions, that
ping only pullets; do not pro-
ny fertile eggs, which means
males are kept; and are sell-
all of the hens at the end of
son. They cull the flock reg-
during the season to maintain
rate of production and then
ll the hens at the time that
llets should go into winter
rs. It must be remembered
ullets must be early hatched
ll matured to produce fall and
eggs. The question of quality
s, which means their produc-
ssibilities, is another point that
ould never overlook. Good
g must always be stressed and
on should think of that fact
ing chicks or pullets. A chick
et is not just a chick any more
rather a potential machine
possibilities are determined by
rkmanship and material that
o its construction. The ma-
means the breeding back of
hick and workmanship means
y in which it has been devel-

an take the best chick that was
atched and turn it into a posi-
ss by improper handling dur-
e brooding season. It may
ike a big expenditure of time
the attention that is demand-
certain times, but it is well
while. Even crawling out of
m bed on a cold night to coal
y mean a little bigger profit
lowing season.

aredness is a happy, often
rked term that still needs to
ived for many occasions. Every-
that we plan on doing for the
ear is going to be determined at this time. We can make or break the business for the year.

Only good pullets are worth keeping and to make good pullets one cannot afford to take any chances or make many slips during the growing season.—J. B. HAYES.

Part of Barn for Poultry House

Our dairy barn is too large for the number of cows we have. As we are going to remodel with new equipment, could we have a practical poultry house in this unusual space? Plenty of windows for light, good cleaning facilities, etc. A solid partition would separate both parts. The building is not of a basement type.

Spring Valley, Wis. H. E. R.

I believe this type of barn or one end of the barn which you now use, due to the fact that it is not of a basement type, can be arranged very satisfactorily as a poultry house since it has everything in the way of a building that we want.

It means you are undoubtedly carrying a hay mow above it with a heavy hay pack or straw pack, which is the thing that we are looking for in connection with a good building.

To emphasize the possibility of doing this I might refer to a man in Southern Wisconsin who has converted one end of the hay mow into a chicken coop or into a pen with the ends and one side and top covered over with hay and straw since he keeps all of his straw under cover, and has carried 180 birds in there during the past two years very satisfactorily. In fact, he had a constant production of somewhere between 70 and 72% during most of the winter. Those birds up to the first of August were still carried in absolute confinement without any outside run and will be taken out only in time to be replaced by the earliest hatched pullets which will again occupy those quarters. This is on a general dairy farm and is an indication of what might be possible under those conditions.

It, of course, would be necessary to give proper attention to window distribution, the admission of direct sunlight in there, and depends on your location, which I don't know, and the addition of cod liver oil to the ration for those birds during the winter period. The depth of this house should not be so excessive that it will be impossible to get light back into the building. Even though this may be so it will be possible to use artificial lights in there for the birds during part of the day for feeding purposes and the cod liver oil will take care of the other requisite.—J. B. HAYES.

Tuberculosis in Poultry

That hogs contract tuberculosis from poultry is one of the dangers of this dread disease in the flock pointed out by the Wisconsin Live Stock Sanitary Board. The measures suggested by this commission on how to control and eradicate fowl tuberculosis are as follows:

1. Prevent poultry from eating dead birds.
2. Clean and disinfect houses and runs frequently.
3. Send suspicious livers to laboratory or to your veterinarian for examination.
4. Dispose of flocks if tuberculous birds are found.
5. Purchase birds for restocking from healthy flocks.
6. Dispose of hens more than two years old.
7. Consult your state live stock officials or write the Chief, Bureau of Animal Industry, Washington, D. C., for further information.

24

3 to 4 Bushels per Acre

—are overlooked by huskers according to various authorities who have kept accurate records over a period of time.

Bernard Vogen, Rushford, Minn., writes us that "the average man gathering standing corn will leave several bushels per acre in the field. It costs from 4 to 6 cents per bushel to gather and store a crop of corn. Hogs will gather it for nothing and make it into pork."

How much does it cost you NOT to have hog-tight fence? Even only 3 bushels wasted per acre on 40 acres at 80 cents is $96.00.

RED BRAND FENCE
"Galvannealed"—Copper Bearing

will make enough extra grain and live stock profits to pay for itself in 1 to 3 years by making possible hogging-down, rotating crops, pasturing after harvest, etc., and the profits will pile up for many, many years.

C. W. Lynn, Norman, Neb., writes: "My hogs paid me $1.26 per bushel for my corn in a 20-acre field. Hog-tight fence saved me the labor of husking, shelling and hauling (all big items) to say nothing of the higher grade of market hogs and the premium on my corn crop."

Gotlieb Detke, Appleton, Minn., hauls no manure, his farm produces twice as much as it used to and is worth double what it was before he fenced stock-tight.

A. E. Longenecker, Leonida, Mich., says 20 sheep and one sow will pay the taxes on a 200-acre farm and build 100 rods of fence each year.

We have thousands of other comments from successful farmers telling about the extra profits that are the result of hog-tight fence.

Fence and cross fence this year for greater gains. Ask the Square Deal dealer to show you RED BRAND FENCE.

An extra heavy coating of zinc "Galvannealed" on the outside keeps rust out. Rust-resisting copper mixed in the steel keeps long life in. These things make RED BRAND last years longer. One piece stay wires, well crimped line wires and can't-slip knots keep it trim, hog-tight, bull-proof. Fence and cross fence this year with RED BRAND for bigger profits.

What has been your experience with or without good fence? We will pay $5.00 or more for each letter that we use. Write for details, catalog and 3 interesting booklets that tell how others have made more money with hog-tight fence.

Eastern States Exposition

(Continued from page 969)

side may have thought her lacking in extreme dairy type but her record of 995 lbs. butter in a year hardly supports such a criticism. She made a very acceptable senior and grand champion.

Elmwood took the 4-year-old class with Oakwood Piebe Ollie and headed the two-year-olds with a daughter of Forum Patriarch. In the 3-year-olds the Overbrook Holstein Dairy headed the line with a big daughter of King Sweet, not as smooth a heifer as she might be but a good one with a first class udder.

Elmwood's heifer calf, Black Pearl Ormsby Korndyke, was the outstanding junior. She is right in bloom and carries an unusually capacious body without spoiling her back line.

H. E. Robertson of Pennsylvania headed the get of sire line-up with a 2-year-old bull and three heifers by King Piebe of York, an undefeated group thus far this season.

[EDITOR'S NOTE—We regret the remaining photographs of the Eastern States Exposition did not reach us in time for publication in this issue.]

"Talking Cow" Proves Rare Phenomenon

"The Talking Cow" promises to be one of the sensations of the National Dairy Exposition at Memphis, October 15—22. "The Talking Cow" will be a true-to-type size Jersey and will tell her story in simple language. She will be a rare phenomenon, answering questions, explaining how she should be cared for, fed and milked for the best production. "The Talking Cow" will be a part of the "Dairying in Dixieland" exhibit. Eleven southern states will show here the progress and possibilities of dairying in the South. Dairy extension specialists of five southern states are preparing a central educational exhibit around which will be grouped the individual state exhibits. The change in conditions in the South since the coming of the dairy industry will be graphically pictured.

Killing Canada Thistles

HOARD'S DAIRYMAN:—I notice your comments on Canadian thistles in a recent issue.

If the Canadian thistle is cut three times a year for three years it is gone; in fact if cut three times one year there will be very few of them to cut the second year. If you can get a stand of alfalfa you will see very few plants in the hay after the first cutting.

Oregon. C. L. SMITH.

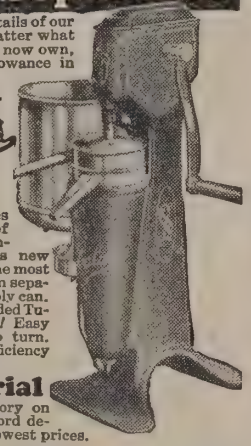
Judging Dates

National Dairy Exposition

Tuesday, October 18—Jersey cattle judging begins at 9:00 a. m.

Wednesday, October 19—Ayrshire and Brown Swiss judging begins at 9:00 a. m.

Thursday, October 20—Guernsey judging begins at 9:00 a. m. Holstein judging begins at 1:00 p. m.



Friday, October 21—Holstein judging completed.

WHINN FARM, SALEM, OHIO

It Milks the Cows CLEAN

You *can't afford* To Milk by Hand

WOULD you go back to the hand scythe or cradle? No! And you can't afford to milk by hand any more than you can afford to mow your hay with a scythe or cut your grain with a cradle. And why should you be tied down to a never-ending grind—twice a day, seven days in a week, when thousands upon thousands of farmers have taken the drudgery out of dairying and increased their profits at the same time with a Burrell Milker. It will milk your herd so much quicker, better and more safely than hand milking. And, with the Burrell Milker, the work of hand stripping is also eliminated—*It Milks the Cows Clean.*

MANUFACTURE THE CONCRETE MASONRY FOR BUILDINGS LIKE THIS IN YOUR TOWN

and MAKE $1000 to $1500 a month, net Profit, *and have a* permanent business of your own

READ THIS. Five years ago a man in Indian Orchard, Mass., had a sand hill but hardly any money. We showed him how to make concrete masonry in large quantities with our automatic machinery. Today he operates four big automatic machines, and makes from $40,000.00 to $50,000.00 a year. We have hundreds of similar cases, where our big-production, automatic masonry machines have made fortunes for their owners.

START NOW. Concrete masonry is crowding out lumber and clay brick for building. It is cheaper, stronger, more weatherproof and fireproof and lasts forever. Demand for machine-made concrete masonry now bigger than the supply. Now is the time to get into this fine and permanent business **right.** Our engineers make it easy for you. Don't let another beat you to it in your town.

Swine

Pennsylvania Moves to Prevent Hog Cholera

To prevent the spread of hog cholera in Pennsylvania the department of agriculture of that state has issued a new regulation effective September 1, setting forth how swine shall be transported into the state, how they shall be handled within the state, how sales may be made, and how dead swine shall be disposed of.

Space does not permit publishing the regulation in detail. The chief objectives are: (1) to prevent shipping the disease into the state; (2) to prevent shipping diseased swine within the state; (3) to guard against the possible transmission of the disease through the sale and movement of breeding animals; (4) to compel the proper and safe disposition of hogs that have died of hog cholera.

For years we have considered the promiscuous transportation of swine without regard to the possibilities of starting new centers of infection as a great menace to the proper control of the disease. Pennsylvania is working in the right direction by enforcing a good regulation.

How to Know and Treat Swine Mange

Two decades ago swine mange was not considered a serious parasitic disturbance. Today it has become so widespread that the damage is reaching the killing floors of meat packers. Not only this, but more feed is required to produce 100 lbs. of live pork in infested herds.

Swine producers will do their pocketbooks a favor by carefully inspecting their herds at this time of year for evidences of mange. The disease is more severe and the symptoms more pronounced during the winter season.

The symptoms are first seen in suckling pigs. They scratch and dig at their sides, fore flanks, and neck with their hind feet and do a lot of rubbing on convenient objects. The hair stands erect, the coat is rough, thick scabs form in the region of the withers, top of neck, and about the ears and face. As the disease advances the skin becomes wrinkled.

The cause of swine mange is a very small mite parasite which burrows in the outer layer of the skin. Superficial treatment does not effectively reach them. The young mites hatched from eggs go through the various stages of development in the outer layer of skin.

Swine mange is spread by direct contact with an infected animal or by contact with infected quarters. To treat the skin of infected animals and not clean up the sleeping quarters is but to play with the control of the parasite.

The treatment consists in the external application of substances that will reach and kill the parasite without injuring the animal together with the disinfection of sleeping quarters so the animals will not become reinfected. Good care and proper feeding also have a part in helping infected pigs grow in spite of the handicaps.

One of the most efficient and economical remedies, where it is necessary to treat quite a number of animals, is the lime and sulphur dip. A recommended formula calls for 8 lbs. of fresh lime, 24 lbs. of flowers of sulphur, and 100 gallons of water. The lime is slaked with sufficient water to form a thick paste. The sulphur is sifted in and mixed well with a hoe. This mixture is boiled with 25 to 30 gallons of water for one to two hours. When ready to use add enough water to make 100 gallons of dip. The dip should be used warm—100° to 110° F. (The boiling should be done out of doors to avoid disagreeable odors in the house.)

Simple Mineral Mixture for Fall Pigs

The veteran experimental feeder at the Iowa Experiment Station, John M. Evvard, has the following to say about a simple mineral mixture for fall pigs:

"It is surprising how well a simple mineral mixture will usually respond in the swine feeding lot. It is surprising that even common salt may give results that are greatly superior to those obtained where no salt is fed. A simple mixture of salt and wood ashes often yields wonderfully good results. Of course when we use salt and wood ashes we have a mixture that carries a number of essential nutritional elements, chief among which are calcium, potassium, sodium, phosphorus, and magnesium.

"A very good, simple 'backbone' mixture which carries the outstanding and main deficiency elements such as are needed to balance up our ordinary feeds may be made up per hundred pounds as follows: Hard wood ashes, 60 lbs.; spent bone black or bone charcoal, 25 lbs.; common salt, 15 lbs.; potassium iodide, 0.02 lb. (two one-hundreths or one-fiftieth of one pound.)

Comparing Spring and Fall Pigs

After completing some swine feeding experimental comparisons at the Minnesota Experiment Station, E. F. Ferrin made the following summary with respect to the comparison of spring pigs with fall pigs:

"Fall pigs are more difficult to raise than spring pigs, but when handled carefully they are at least equally profitable. A greater variety of feeds is necessary to grow fall pigs successfully because green crops are not available. Fall pigs make as rapid gains when well housed and handled as do spring pigs. The amount of feed required to produce gains was practically the same for pigs farrowed at the two seasons. Cheaper gains were made by fall pigs because feed costs were lower in winter than in summer. Fall pigs sell at higher prices than do spring pigs. If brood sows are kept for the production of more than one litter a year overhead feed costs are reduced."

Supplemental Mixture for Winter Feeding

Where skimmilk or buttermilk is not available for feeding in limited quantities along with tankage, the combination of tankage 2 parts, linseed meal 1 part, and alfalfa meal 1 part provides an effective supplement to corn or other grains for pigs in winter or dry-lot feeding. Pigs weighing from 50 to 100 lbs. should have about a half pound daily of the supplement together with corn self-fed.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Udder Tumors

We have been asked whether the udder of the cow ever is the seat of cancerous tumors such as form in the human breast. Fortunately we are able to answer in the negative; for we never have known of a malignant cancer affecting the bovine udder. It is not uncommon, however, to meet with sarcoma in cattle. Large tumors of that sort may form in the connective tissue of the shoulder or thigh and when cut out return and are accompanied by many other tumors, large and small, externally and internally, so that the animal succumbs or has to be destroyed. Such tumors, when advanced, cause lameness and emaciation and the milk of an affected cow cannot be considered fit for use. True cancer (carcinoma) may also be met with in cattle, chiefly in the form of cancer of the eye (fungus hematoids), which is malignant and generally incurable. It does not, so far as we are aware, ever affect the udder, but when emaciation has resulted the milk of an affected cow certainly should be discarded.

When a hard lump is felt in a cow's udder it is usually composed of fibroid, scar, or cicatricial tissue and is not malignant. Such tumors result from severe attacks of germ-caused mastitis (garget), the normal, milk-secreting tissue being replaced by scar tissue which cannot secrete milk. Presence of this tumor should be taken as an indication that the cow has had an attack of mastitis and that recurrence of the attack will be probable and eventually may destroy the function of the affected quarter for sound milk production. It is, therefore, wise to sit down and thoroughly feel or palpate the udder of a cow before purchase and to reject a cow that has a tumor indicative of mastitis. Small, wart-like tumors or papilloma commonly form on the lining membrane of the teats and interfere with milking. They may be felt by rolling each teat in turn, between the thumb and finger. Blood in milk often is traceable to these growths and they are also a common cause of hard milking or the spraying of milk. Their presence is sufficient reason for rejection of a dairy cow.

Other tumors occurring in the cow's udder may be tubercular, or due to actinomycosis or botryomycosis. Of these the tubercular one is, of course, highly dangerous, as the affected quarter may yield milk that teems with the bacilli of tuberculosis. Fortunately, the tubercular tumor is not very common and rigorous testing with tuberculin surely eliminates tuberculous cattle. It may be remembered, however, that tuberculosis of the udder almost invariably is indicated by enlargement and hardening of the large lymphatic gland, located high up at the rear of the udder, and that is easily noticed when making a physical examination of the cow. The actinomycotic tumor is caused by the "ray fungus" which is also the cause of lump jaw in cattle. It is not very common but some of the chronic or persistent sores which form between the halves of the udder occasionally are attributable to the fungus and are difficult to cure. Botryomycotic tumors are similar to those caused by the ray fungus and removal by dissection is the correct treatment for either of these tumors and also for chronic actinomycotic sores.

Are You Milking Four or more Cows?

More milk, better and cleaner milk. Increased income from your cows and increased net profit. How? Clipped cows is the answer. Hundreds of farmers have proved it to their own satisfaction. And I'll add to that my own iron-clad

Money-Back Guarantee

that this STEWART clipper will do everything we claim for it—that it will give you cleaner and healthier cows—more milk! Better milk! More profits! And there's but one small cost—no extras—no continuous expense.

You Can Afford It!

If you're milking four cows or more, you can get your money back in four weeks' time. Others have done it. Ask your dealer or

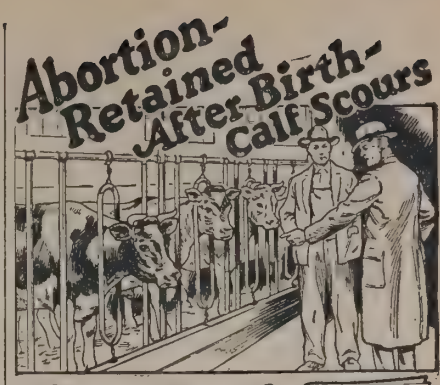
Blood in Milk

We have a grade Jersey heifer almost three years of age that is giving bloody milk. She was fresh last September and is due to freshen about Dec. 1, 1927. Her milk was all right until about the middle of April it began to be bloody, just enough to show in the cream separator. The milk is not stringy, neither is her udder apparently sore or injured. Do you think this condition can be cured?

Long Lane, Mo. H. D. H.

Set a sample of milk from each quarter of the udder in separate bottles which have been sterilized by boiling. Label each bottle that the source of the contents of each may be known. In that way you can determine which quarter is yielding bloody milk. It may be that a growth in a teat bleeds a little from irritation at milking time. A veterinarian can remove such a growth by operation when it is just inside the outer opening of the teat. If it is located high it would be better to let a calf nurse or to dry off the secretion in that quarter. As you have begun drying off the cow that process should be continued. It is possible that the milk may be normal when the cow calves.



Fouls

There is, th year, a seemingly large number of cases of foul-in-the-foot among the dairy cows through here. Is this disease due to a specific germ or is it an infection due to filth? Can foul-in-the-foot be transmitted from one cow to another just through one cow stepping where pus from an infected cow had been, or is?

St. Charles, Ill. R. Dairy.

Inflammation of the skin between the toes is caused by wading or standing in mud or stagnant water; walking through coarse, wet grass; and

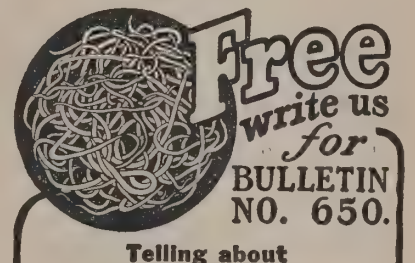
Free Book tells what to do

How to turn losses Cows Calves Poultry Pigs into Profits

For 15 years we have been watching the use of B-K on the farm and checking up our observations with laboratory tests. Our book gives you the results of this vast experience without cost. The book covers:
Abortion is caused by germs of several kinds. What they are and what can be done in prevention and control is told in our book.
Retained Afterbirth—How to reduce adhesions, bring safe, natural removal without manual help, and heal the tissues.
Calf Scours—The cause, how to prevent and save your calves.



There is No Substitute for B-K

B-K is made by our special process, which produces the only stabilized hypochlorite ever approved by the American Medical Association. Its germ destroying power is 10 times greater than that of undiluted carbolic acid, yet B-K contains no poison, or acid, and leaves no odor.
B-K is dependable. Your money back if not satisfied.

After using TOMELLEM PASTE on calves up to 2 months old. An **easy** and **safe** way to do away with dangerous horns. One application enough. No bleeding, soreness or scars. Endorsed by county agents. Keeps indefinitely. Bottle sufficient for 50 calves. **$1.00 Postpaid.** At dealers or direct by mail from
TOMELLEM CO., Dept. B, CALICO ROCK, ARKANSAS

Watch our Special Opportunities Page for real farmers' bargains.

getting foreign matters lodged between the toes. Lacerations or abrasions ensue and these are invaded by the filth germ *bacillus necrophorus* which causes death of the tissues it affects. Pus forms and burrows. The diseased parts give off a foul smell. Infection may occur in the way you suggest. Isolate affected cows and keep them in the stable while under treatment. Keep the other cows out of filth and wet. Treat by so restraining the cows that their feet may be handled. Perfectly cleanse the feet and cut away all loose or rotten horn of sole or wall and remove lodged foreign matters. Then immerse the hoof, for five minutes, in hot water containing two ounces of bluestone per pint and afterward wrap the foot with sterilized cotton bound in place with a narrow bandage criss-crossed between the toes and then tied around the pastern. Keep the cotton and bandage wet with a mixture of five parts of carbolic acid or coal tar disinfectant, three parts of formalin, and 100 parts of boiled water. When healing is about complete simply apply pine tar two or three times a week.

20 years may be a long time, but—

BROWN SWISS

Brown Swiss Bulls Mark Imprint on Grade Herds

Extra large production in a herd of grade cows may be gained by breeding with a Brown Swiss bull. They sire strong calves of a uniform type, well adapted for the general dairy farm. Mature bulls weigh between 1,800 and 2,500 lbs.

We will be glad to help you secure a Brown Swiss bull and, if you desire, a heifer or a cow.

QUEEN OF THE SOUTH

RED LADY 396118

Official record 1,028.51 lbs. butterfat, 19,608 lbs. milk. Highest producing cow, all breeds, South of the Mason & Dixon Line.

For over half a century the Jersey cow has been the first choice of Southern dairymen and breeders. The experimental stage has passed and dairying has come to mean Jerseys. Southern appreciation of the highest quality milk and the efficiency and profitableness of the Jersey cow have made the Jersey undisputed Dairy Queen of a vast empire.

In the "cow, hen and hog" program for balanced agriculture the Jersey cow is indispensable.

Study the Jersey herds at the National Jersey Show. Talk with the owners and consider carefully the wealth-producing ability of this superb breed.

Jersey Bull Calves

We are offering at reasonable prices a few bull calves sired by Vive La France's Darling Son and out of cows of rich Sophie's Tormentor breeding. Vive La France's Darling Son is out of Vive La France, the first cow to make over 1000 lbs. fat and the cow whose average of 890 lbs. butterfat for first 6 lactation periods exceeds that of any other dairy cow. He is sired by Darling's Gallant Boy, the silver medal sire and full brother to Darling Jolly Lassie, 1141 lbs. fat as Jr. four-year-old. Two of these bull calves are out of granddaughters of Sophie's Agnes, the first Jersey cow to make 1000 lbs. butterfat.

Hoard's Dairyman Farm, Fort Atkinson, Wis

AYRSHIRES for Steady Production

It's that steady production everywhere, under all conditions that is making the Ayrshire the most popular dairy breed. Ayrshire breeders have long known that profits come from cattle that keep everlastingly producing milk that tests four per cent. Herd records prove that these breeders have developed cattle that lead in high average production.

Ayrshires are built for service. Their rugged bodies and perfect udders wear like iron and keep them working to a ripe old age.

Your profits may be increased by the use of an Ayrshire bull, or the selection of a few females.

Write for booklets or assistance in locating foundation stock

Will Explain Dairy Work

The part the Bureau of Dairy Industry plays in improving the product of dairies of the country has been made a special order of business for the meeting of the Southern Section of the American Dairy Science Association which will be held at Memphis Tuesday, October 18, in conjunction with the National Dairy Exposition. Two sessions will be held at the Hotel Gayoso, the first starting at 9:30 o'clock in the morning and the second at 2:00 o'clock in the afternoon. The exposition will be held with the Tri-State Fair October 15—22.

On the program are many of the government's leading dairy specialists and Dr. Bradford Knapp, now president of Oklahoma A. & M. College. Dr. C. W. Larson, Chief, Bureau of Dairy Industry, will explain the work of his bureau in full.

WISCONSIN HOLSTEIN SALES ASS'N

Breeders from 15 Leading Counties Cooperating

400 REGISTERED HOLSTEINS
300 HIGH GRADE HOLSTEINS

To be Sold Oct. 27 — November 4

The series of sales held by this Association last spring were a success because they served the buyers and sellers of high class dairy cattle in the most efficient manner. Buyers at last spring's sales were well satisfied because of the fine assortment of practical producing cattle offered for sale.

The cattle listed for sale this fall are even better in quality because breeders throughout the state have more confidence to consign since this cooperative sales plan has been proven a success.

Order in which the sales will be held is as follows:

OCTOBER 27—CHIPPEWA FALLS
OCTOBER 28—WEST SALEM
OCTOBER 29—MAUSTON
NOVEMBER 1—REEDSBURG
NOVEMBER 2—MADISON
NOVEMBER 3—LAKE MILLS
NOVEMBER 4—BARNEVELD

Write for illustrated circular giving more complete information on this sales series to:

JAMES R. GARVER, 704 Beavers Insurance Bldg. Madison, Wis.
In charge of Publicity and Sales Correspondence.

Co-operation in American Agriculture

American agriculture has been transformed from a pioneer type of farming into commercial agriculture. In commercial agriculture the farmer is producing foodstuffs for other than his own consumption. With the development of commercial agriculture, farm marketing has grown from a simple process of exchange between neighbors into a complex marketing system. Farm marketing problems are different today and new marketing methods must be evolved to cope with new problems.

Some of the earliest co-operative organization efforts in the United States are found among the dairy farmers. As early as 1853 a few farmers in Campbell Hall, New York State, organized the Wallkill Creamery Association, and this is probably the first co-operative creamery in the United States. From this small co-operative creamery established 70 years ago, the movement has spread all over the country until today there are some 1,400 co-operative creameries with a membership of 200,000 dairy farmers doing a volume of business of approximately $220,000,000 annually.

Today there are about 600 co-operative cheese factories in the United States doing an annual volume of business of approximately $25,000,000.

There has been a most rapid and remarkable co-operative development in the fluid milk market business the last ten to fifteen years. Today there are about 140 co-operative milk associations engaged in the distribution of fluid milk. They do annual business of $160,000,000. Then in the fluid milk business we also have another type of co-operative enterprise known as the bargaining association. There are some 40 bargaining associations in the United States with 116,000 members doing an aggregate business of $140,000,000 annually.

The extent to which American farmers have recognized the need for organization in agriculture is indicated by the fact that there are now more than 12,000 farmers' co-operative associations through which farmers are developing group effort. The number of farmers' co-operatives has increased from less than 6,000 in 1915 to approximately 12,500 in 1926. During this same decade the volume of business done by farmers' co-operative associations has grown from $635,838,000 to about $2,400,000,000, and the number of farmers who are members of co-operatives has increased from 651,000 to nearly 2,000,000.

Co-operative organization among farmers is the application of better business methods to the production and marketing of farm products. Organization itself, of course, does not solve the marketing problem, but simply creates the machinery to do so. Improved marketing machinery may be likened to a piece of new farm machinery. Every farmer knows that improved farm machinery is of no use to him unless he puts it to work and guides it. Improved marketing machinery is likewise of no value unless it is intelligently directed. We again must rely on that important human equation—leadership.—CHRIS. L. CHRISTENSEN, U. S. Department of Agriculture.

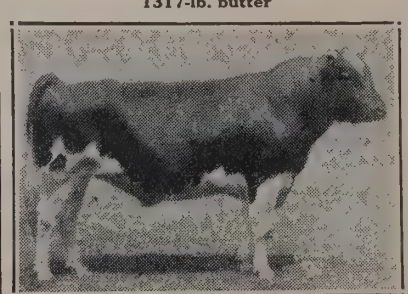
To show his erring brothers how to make cow boarders pay, "Joe Guess" will run his boarding house at the National Dairy Exposition, October 15—22 at Memphis. "Joe Guess" is a three-act rural drama, different from the one at last year's Exposition.

Pleasure and Profit in HOLSTEINS

There is real pleasure in owning a herd of beautiful dairy cattle but real satisfaction comes in knowing that your herd is bringing you a profit. Holsteins are economical producers of milk and butterfat and return a consistent profit to their owners. Holsteins predominate in thirty states of the Union. In these thirty states 76 per cent of the Nation's milk is produced. The average annual milk production of all dairy cattle in these states is 3,806; in the remaining states where Holsteins do not predominate the average production is 2,562 pounds.

Write for our booklets on HOLSTEINS

Visit the Holstein Booth



The Extension Service of the Holstein-Friesian Association will maintain a booth at the National Dairy Exposition where Holstein literature and facts about the breed will be available. Make this booth your headquarters, meet your friends there, use our guides and let us tell you about Holsteins.

DAIRY CENTER SALE

Southern Minnesota's Annual Quality Offering

The "Dairy Center" of Southern Minnesota boasts of many splendid Holstein herds. The majority of the breeders maintain herds that are too small to warrant extensive advertising. In spite of this fact, cattle have been shipped from this section to practically every state in the Union. In the annual DAIRY CENTER SALES they offer selections of their very best cattle, that other breeders and dairymen may become acquainted with the bloodlines of the community. This is distinctly an offering of quality cattle and not a "dumping" proposition.

mClean Herds **75 REGISTERED HOLSTEINS** *Retest Privilege*

MANY SHOW RING WINNERS, including Grand Champions at County Fairs.

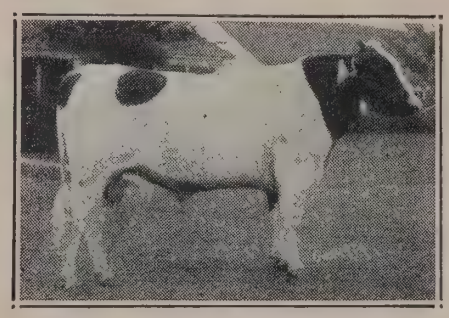
ROCK RIVER FARMS



"Illinois Greatest Holstein Herd!"

NORTH STAR GELSCHECOLA CHAMPION
Our senior sire—13 years old and still active. 12 A. R. O. daughters and more on test. Sire of the Jr. champion female at Aurora in 1926. A 2-year old son has been second or third wherever shown this fall. Four head by him won two seconds, a third and a fourth in large classes at the 1927 Indiana State Fair.

SIR JOHANNA FAYNE SEGIS PONTIAC
A former herd sire. 28 A. R. O. daughters. Sire of the senior and grand champion bull at Aurora in 1926 and at Indiana in 1927. Sire of first prize 4-year old cow at 1927 Illinois State Fair. Sire of first prize get of sire at Ohio and Illinois State Fairs.

NORTH STAR PIETERTJE HOMESTEAD
At 2 years. Jr. herd sire. Sire of first prize senior yearling bull and of first prize yearling herd at 1927 Illinois State Fair. Sire of second prize get of sire at Indiana State Fair.

Type—Production—Health

Our 1927 Show Herd— every animal in it was bred at Rock River Farms—has been a consistent winner this year. In close competition and large classes, every animal we showed placed "in the money," at the Illinois and Indiana State Fairs, and but one animal was outside the money at Ohio.

We Won Premier Breeder Award At All Three of These Fairs

Rock River Holsteins are a commercial herd that make their records in stanchions. No box-stall pampered cows here. Our business is to produce certified milk at a profit. Every milking female in our herd of 214 registered Holsteins must be a profitable producer, else she is eliminated.

In 1923, 63 cows in C. T. A. averaged 11905 lbs. milk, 410 lbs. fat. In 1924, 75cows, only 18 of mature age, averaged 12,458 lbs. milk 425.5 lbs. fat.

15 Rock River cows have produced over 30 lbs. butter in 7 days. Seven have produced over 1000 lbs. butter in a year. 9 Rock River Holsteins are state record cows.

Rock River Farm Holsteins are healthy. They are under Federal Supervision for T. B. and have been regularly blood tested for contagious abortion.

SONS OF PABST PERSISTENCY

FROM PROFIT MAKING DAMS — FARMERS' PRICES

PABST PERSISTENCY is a son of King Segis Alcartra Prilly from a 30-lb. 2-year-old daughter of Creator. He is an excellent individual and every one of his 20 sons and daughters born to date are good ones. We offer bull calves 6 weeks to 6 months old by him, from good producing dams at prices which make them real bargains. Write us today.

RED ROSE FARMS DAIRY, F. B. Ainger, Jr., NORTHVILLE, MICHIGAN

SERRADELLA FARM OFFERS — A 33-lb. Serviceable Colantha Bull

Sired by Sir Dutchland Colantha Denver whose dam is a 36-lb., 1300-lb. daughter of Colantha Johanna Lad. This young bull is from Serradella Kanaka Rosewood, 33.24-lb. 5-year-old that also has a good 305-day record made as a heifer. The bull is 2 years old, straight, and well grown. A bargain at $300.

SERRADELLA FARM, (Federal Accredited Herd), Oscoda, Michigan

OUR 1,000-LB. COWS

Michigan State Herds now own 13 cows with records above 1,000 lbs. butter. One of these is the famous Traverse Colantha Walker with 7 records above 1,000 lbs. and four of these are 305-day records. Her highest record for 365 days is 1267 lbs. butter and 26,158 lbs. milk. Four others have records from 1100 to 1153 lbs. and eight range from 1023 to 1099 lbs.

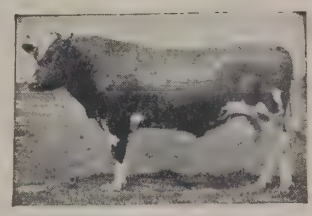
Michigan State Herds are bred for production. Insure production in your future herd by using a sire bred by Michigan State Herds.

BUREAU OF ANIMAL INDUSTRY, Dept. B, LANSING, MICHIGAN

Decreamco Bess Burke Fobes — Our Jr. Sire

This picture of Decreamco Bess Burke Fobes was taken at 12 months of age. He is developing remarkably well and promises to become the kind of a bull you would expect from so wonderful a dam—Wisconsin Fobes 5th—unquestionably the greatest daughter of S. P. O. M. 37th. His sire is Marathon Bess Burke.

Write us when you want a bull or better still come and make your own selection.



THE DETROIT CREAMERY CO. FARMS, Mt. Clemens, Michigan

Bulls of World's Champion Breeding

Sired by May Echo Plus Dixie, a son of Avon Pontiac Echo and De Kol Plus Segis Dixie, the Dairy Queen of the World.

Butter, 365 days, 1,686.68 lbs.
Milk, 33,464.70 lbs.

From Granddaughters of Colantha Johanna Lad

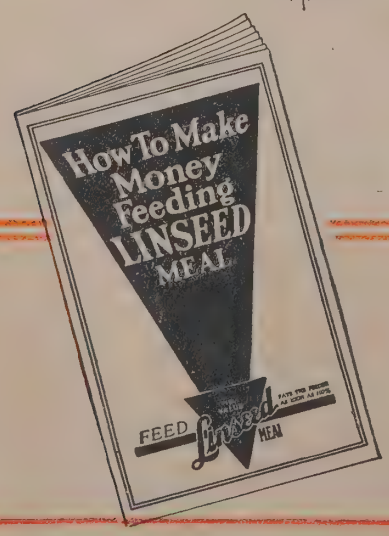
These Two Factors Go Hand-in-Hand

— *if you want bigger profits per head*

Better Stock — *and* Better Feeding

A few years ago all the talk among progressive dairymen drifted toward the subject of improved strains. Today another factor claims equal rank in every discussion — modern feeding methods.



Now it is recognized that profit *per cow* is the thing that counts in making a success with dairy stock. And no matter how much money you spend for better blood, you can't make bigger profits per head until you feed profit-building rations.

This big free booklet contains that kind of rations — practical, tested, balanced by authorities. These rations have played a prominent part in the nation-wide movement for better feeding. Thousands of farmers have sent for this free book. It will also help you make more money with fewer animals, a smaller investment, less work and worry.

A JOURNAL DEVOTED TO DAIRY FARMING

Volume 72, No. 20 Fort Atkinson, Wisconsin October 25, 1927

BUICK *for* 1928

Buick makes *every* road a boulevar

Bumpy, rutty, uneven highways ride like boulevards in a Buick for 1928. Important improvements impart a matchless riding ease—a smoothness over any road in any weather—which assure you a comfortable trip, no matter how far you may drive in a day.

Hydraulic Shock Absorbers

In addition to Buick's famous cantilever springs, Buick for 1928 has hydraulic shock absorbers, front and rear. These have been made an integral part of the Buick chassis, and are *standard equipment* on all models.

The Low-Swung Body

Bodies swung smartly low by means of the exclusive Buick double-drop frame provide greatly increased roadability due to their lowered center of gravity.

—and Matchless Beauty, too

Long, low, flowing lines—surpassingly beautiful color harmonies, inside and out—and restful form-fitting tailored seat cushions—all combine to make every ride in a Buick for 1928 the most pleasing you have ever known.

PROBLEMS IN HERD IMPROVEMENT

G. A. WILLIAMS, INDIANA

REPORT published recently by the Bureau of Dairy Industry, U. S. Dept. of Agriculture, es that there are now approxi-ely 900 active cow testing associa-s in operation in this country. n an influence for the promotion etter dairying is hard to estimate. t there is plenty of opportunity improvement, however, is shown the wide variations in returns n different herds.

o doubt there are a variety of fac- entering into problems of im-vement. Some of them not within the power of dairyman to change; ers could be remedied by ing attention to the ad- of the tester. The test-annot always pass free n blame in all cases.

ifferent associations e different problems. ne general types seem to e more frequently than ers. Four problems have n selected as typical, one of which would it all the space avail-e so each problem will qualified and hence lim-! in nature by combining h it a word beginning h the letter "I."

f blindness can be inter-ted as concealment or ure to function, then the ociation possessing one more of its problems in oncealed, non-function-state is in an enviable ition. These are "I"n-erent members, "I"n-or animals, "I"nade-te rations, and last not least "I"nefficient ers.

ster Must Know How

here is no greater mis-tune which can befall an ociation than that of en-ing an "I"nefficient test-

Whether the organiza-n proves a success or a ure depends very largely his resourcefulness and lity to study and manage different personalities he association. He must e an intimate knowledge the difficulties encoun-ed by his members, he st maintain a fund ready information with which to wer their questions sincerely and lligently and lastly he must pos-s a knowledge of human nature iciently broad to enable him to fit the home atmosphere which he ounters. A combination of all se qualities in a single individual ot always secured easily for the ry offered.

he new tester usually receives earty welcome among the mem-s. As a rule, the young man re-nds to this hospitality and recipro-cates in such ways as lawning the door yard, repairing some piece of farm machinery, or even offering to wipe the dishes for the busy housewife after the evening meal is over. Lending a helping hand in some such way costs the tester little and does much to win the confidence of his members.

It often happens that the tester has never assumed any great amount of responsibility. While living under the parental roof his duties were of a routine nature. Amid all the strange surroundings he fails to realize the scope and multitudinous nature of his work. If these shortcomings were pointed out in a friendly way by one of the members or better some director, a great deal of dissatisfaction could be avoided.

Members Must Make Information Effective

"I"ndifferent members may be listed as the second party of this blind quartet. In not a few cases this condition comes about because the benefits of membership were oversold to the dairyman when he signed the contract. The plan appeals to some men only as a means of discovering the butterfat test of various individuals in the herd. The competitive side appeals to some.

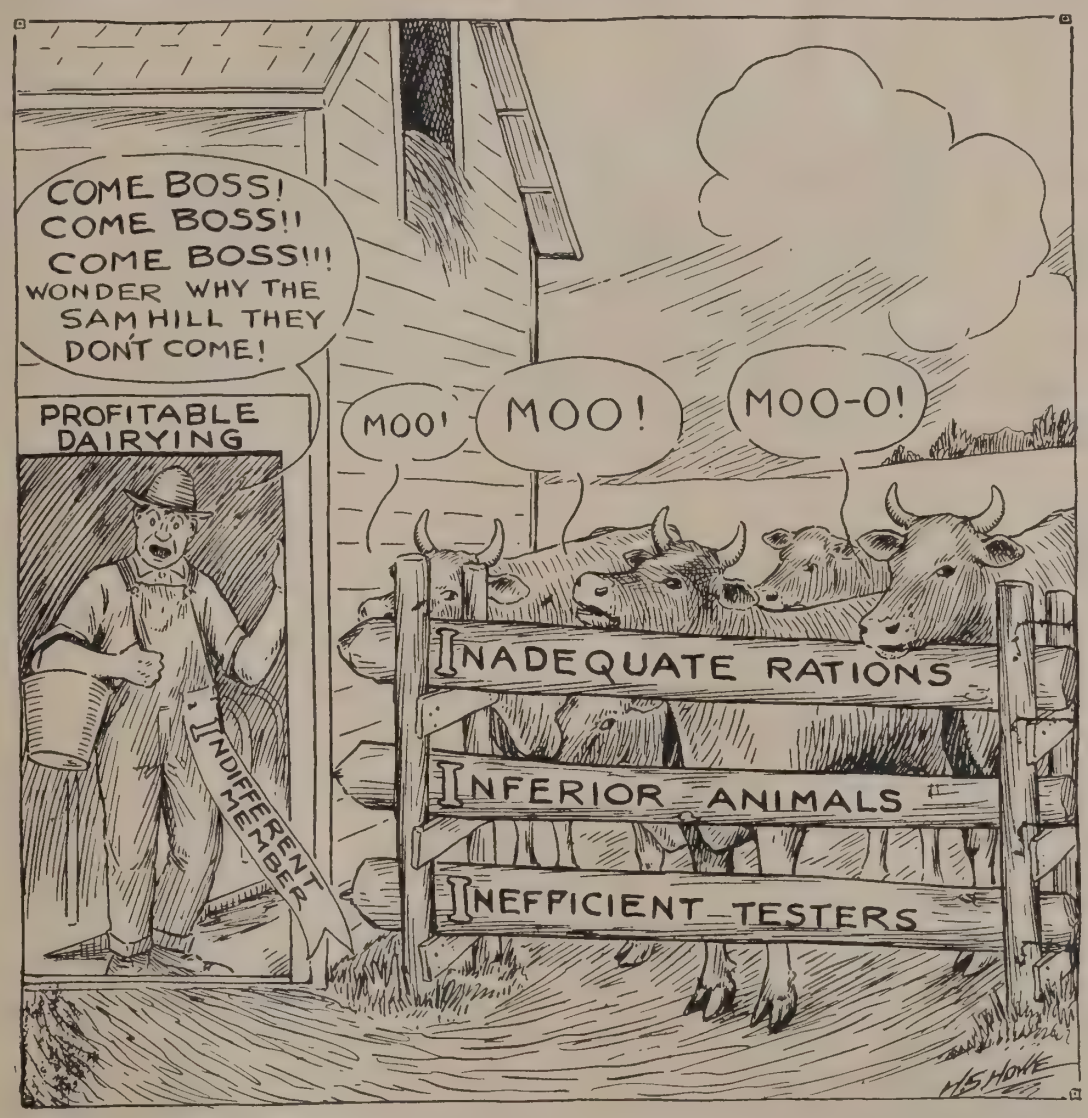
Perhaps the greatest reason for indifferent members is because they fail to study their records. One of the qualifications of a successful tester is devising different ways to arouse interest on this point among his members. It certainly is discouraging for the tester to work out a set of rations when he leaves and come back next month and find the herd book covered deeply with papers and the ration unchanged.

There are many reasons advanced by members for not putting the recommendations of the tester in practice. Lack of time is perhaps the most common excuse. Quite frequently we encounter a circumstance which we have never been able to explain. For years a herd of cattle had been fed an equal daily grain allowance. The first month these cows were on test they showed an income over feed cost of $24.77. No change was made in the roughage during the next 30 days; the same grain mixture was fed but the amount each cow received was based on production. The income at the end of the second month was $63.28. Before another month had passed each cow was again receiving an equal allowance of concentrates.

Scrub Cows Must Go

The third factor which may retard the progress of an association is the herds themselves. Inferior animals may prove a great disappointment to the owner, especially if the herd be a registered one. Retaining a cow in the barn which does not pay her way certainly does not swell the bank account. The idea of selling her to some other breeder can rarely be justified, although there are cases on record which prove that a cow may be a boarder in one herd and yet make a profit when transferred to other management.

It is impossible to set a standard of production which should be adhered to in different herds. It is generally accepted, however, that the cost of feed is about equal to the other items involved in the production of milk. The cow that does not give an income over feed cost equal to the cost of her feed bill for the year does not pay her way.



A five-year summary of more than 14,000 yearly Indiana C. T. A. records shows that all records between 201 and 300 pounds of butterfat were produced by cows whose average feed cost for the year was $67.37 and that the income over feed cost for the group was $69.97. There were 1,435, or approximately 10%, cows included in the summary listed in this group. So far as the average conditions apply in Indiana it would seem that animals producing less than 200 lbs. fat during the lactation should be classed as unprofitable.

Better Feeding—Less Cows—More Profit

The last member of this "blind family" is "I"nadequate rations. No matter how much ability to produce a cow may have inherited from her an-

EVER PUT DOWN THE BARS, MR.?

Minnesota's Oldest Cow Testing Association

GUY A. PETERSON, WISCONSIN

MINNESOTA'S oldest cow testing association, the Pioneer in Freeborn County in the vicinity of Albert Lea, is a remarkable example of the value of cow testing work for the dairy farmer. Organized by Theodore Sexauer of the agricultural department of the Albert Lea high school in the spring of 1910 and started by Tester H. C. McMurray on December first of that year, it has been an inspiration for the development of better dairy herds and has left its imprint in the form of more beautiful and happy homes. Usually when one finds a member of long standing he will find him living in a well-kept, tree-shaded home equipped with most of the modern conveniences.

F. S. Ruble & Sons have bred Holsteins since 1908. From left to right: Albert, Fred, Clifford.

The association is one of the half dozen oldest in the United States. Mr. McMurray has been its tester nearly all the time, so there is probably no cow tester in America who has tested so many samples of milk as has he. At one time when the farmers took their own samples he tested 1,200 cows a month and kept the books on them in spite of the fact that he has but one arm. There is probably no better loved man in Freeborn County today than "Mack," as he is affectionately called by those who know him.

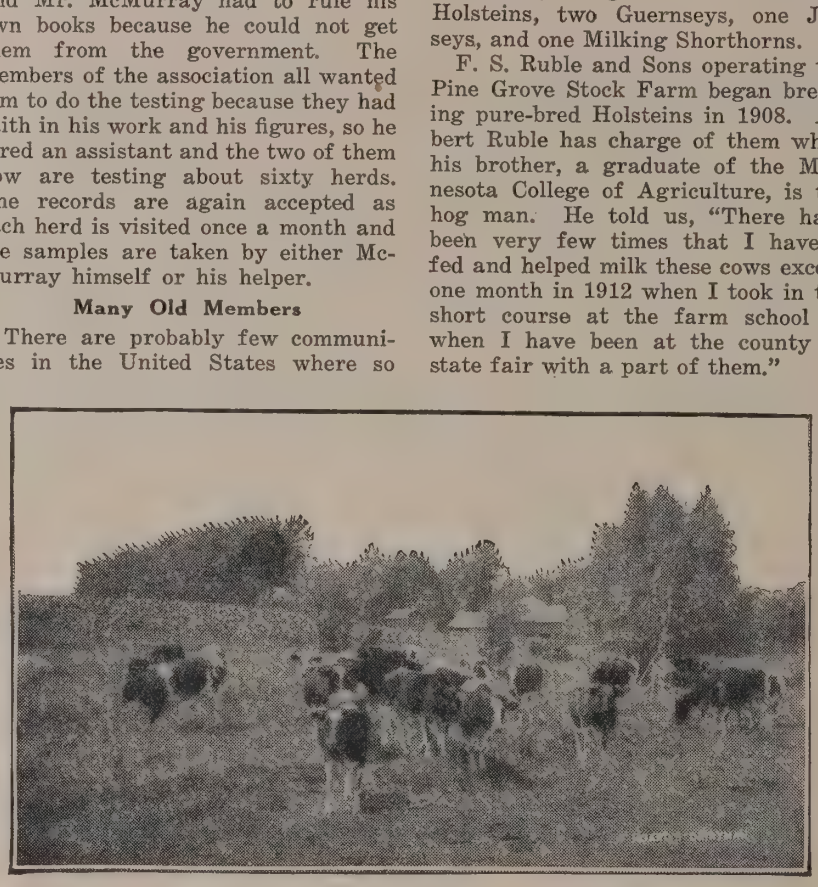
A friend of the children, he usually has one or two of them with him, and many are the sons and daughters of these dairymen farmers who have ridden with him in his old buggy. He still drives a horse but the old faithful that he drove so many thousands of miles on his business of eliminating the unprofitable dairy cow is no more, though the memory of this grand old horse is still vivid in the hearts of many.

Mr. McMurray makes a practice of taking a picture of all the babies on his route and weighing them each month, after he finishes the testing. As soon as a boy is born he enters the addendum "and son" to the firm name, so that is why so many of the members of the association have partnership names. Save for a period of three months when he was doing official testing out of St. Paul and one year when he worked in an Albert Lea bank, Mr. McMurray has had charge of the testing in that community ever since it was started. Even while he was working in the bank, he tested samples for a number of his original members. When he started work in the bank a number of regulation 26 member associations were organized with many of his herds in them. The testers selected for the work did not prove satisfactory, however, so the associations disbanded and Mack got most of his old members back again when he left the bank.

Last year the figures for his association were not given official recognition because some of the farmers were taking their own samples. This resulted in some unpleasant feelings and Mr. McMurray had to rule his own books because he could not get them from the government. The members of the association all wanted him to do the testing because they had faith in his work and his figures, so he hired an assistant and the two of them now are testing about sixty herds. The records are again accepted as each herd is visited once a month and the samples are taken by either McMurray himself or his helper.

Many Old Members

There are probably few communities in the United States where so many dairymen have been members of a cow testing association for so many years. According to Mr. McMurray, six herds have been in the Pioneer association since the beginning. These are E. A. Nelson and Sons, F. S. Ruble and Sons, Victor Stiehl and Sons, M. L. Head and Sons, Ott Brothers, and Alfred Berglund and Son. Three herds have been tested about 14 years. Nineteen herds have been tested for 10 to 12 years. Four herds are now averaging over 400 pounds fat a year, of which two have averaged it twice and one three times.



It takes a good man to hold so many farmers together in this kind of work for so long a period of time. His work is appreciated, however, for he says of these people, "As for being hospitable, these homes are just like home to me. When I was in the hospital last winter they were more than brothers to me with flowers, visits, and letters while there."

Farms are Named

Not long ago we visited the six farms that have been testing since 1911 and found that every one of them were operated by owners who lived in beautiful homes and who took time to enjoy life as they farmed, while the other was tilled by a prosperous tenant. Whether Mr. McMurray had been instrumental in instigating the commendable custom of naming the farms we did not learn, but it was a great pleasure to us to find them proud enough of their homes and vocation to give their farmsteads a name.

The fact that it doesn't make much difference what breed of dairy cows one has if he loves those he cares for was forcibly emphasized here because even the most skeptical would have to admit that all of these farmers are successful, though two of them breed Holsteins, two Guernseys, one Jerseys, and one Milking Shorthorns.

F. S. Ruble and Sons operating the Pine Grove Stock Farm began breeding pure-bred Holsteins in 1908. Albert Ruble has charge of them while his brother, a graduate of the Minnesota College of Agriculture, is the hog man. He told us, "There have been very few times that I haven't fed and helped milk these cows except one month in 1912 when I took in the short course at the farm school or when I have been at the county or state fair with a part of them."

A PART OF ALFRED BERGLUND'S HERD OF CONTENTED HOLSTEINS

The herd average for all the cows in the barn has varied from 314 pounds fat to 435.3 pounds per cow. The record of 435.3 pounds per cow was made in 1919 with every one of the 26 cows in the herd on test. This record has never been equalled in the county and there are probably few herds of this size in the state that have equalled it. The cows were milked three and four times a day part of the time, however.

The best cow they have ever owned is Josephine Pietertje De Kol Galis. She won first prize at the Minnesota State Fair in 1918. She produced 750.5 pounds fat from 20,305 pounds milk in her best year and has a six-year average starting as a two-year-old of 591.3 pounds fat. She has two daughters that the boys think will beat her production record, however.

The entire herd has been milked with a machine for more than 10 years and Albert says they have never spoiled an udder with it yet. The ration for the herd in 1910 was made up of silage, timothy, stover, corn, and a little bran and oil meal, but the 1926 ration is more suitable for high producing cows. Their winter ration is silage 40 pounds, alfalfa hay 8, ground oat 6, ground corn 2, bran 2, oil meal corn gluten meal 5, and molasses

Berglund Succeeds on Homestead Farm

Alfred Berglund, the other Holstei breeder of the six pioneer members

VICTOR STIEHL'S BEAUTIFUL FARM HOME

has made a success with the black an white breed on his "Homestea Farm." He gives most of the credi for the improvement of his herd t Nockdair King Superba Segis, th third pure-bred sire that he owned Before he started in with Holstein he had been breeding Shorthorns, bu he could rarely get the daughters o his high producing cows to better o even equal their mother's records The lowest production his herd ha ever had since he started testing wa an average of 309 pounds fat per co made the first year in the association but that was second highest at tha time. The fact that the lowest her that year averaged but 90 pounds fa 1,976 pounds milk, is evidence enoug of the improvement that has resulte since the testing association wa started.

The best record was 397.5 pound per cow with every cow tested an none of them milked more than twic a day. While Mr. Berglund has bee busy improving his herd he has als given much of his time to the bette ment of his community. The unpai office of president of the Farm Burea calls for much of his time and energ but he is glad to give it because he ha faith in the future of agricultur when it is pushed along the lines ad vocated by that organization. He ha been a member of the town board fo many years, is an ex-president of th county Holstein-Friesian associatio and is one of the directors in the co operative egg and poultry associatio at Albert Lea.

The cow testing fees for the fiftee years have amounted to about $50 but he says it is the best investmen he ever made. His cows have made i possible for him to give his childre college educations, for though he di not have the privilege of going t school much when he was young, h wants to see his children have the bet ter opportunities that an educatio will give them.

Though Berglund harvested 5,00 bushels of small grain from his far last year, every acre of which gets

Tales of My Grandfathers

RANSOM A. MOORE, WISCONSIN

Y grandfather, Seth Moore, Sr., was born in 1800 near where Amherst, Mass., is now located. me from a long line of ancestry migrated to America from Eng- in 1632 more because they loved the great outdoor life than to gain religious freedom.

SOM A. MOORE

Seth Moore's father, Joseph Moore, enlisted as a messenger boy under General Washington and served throughout the war.

After his re- home, he married and his entire y was born in Massachusetts. after the Revolutionary War ountry began to settle up rapid- he and his family moved west, ng near Burlington, Vermont. nly lived a few years at this , and in 1810 crossed Lake plain and located a mile or two of the village of Plattsburg, York.

lived here during the war of and my grandfather, who lived us when I was a boy, related incidents of that time. Great- lfather had a little farm and a n on the main highway leading Plattsburg. He was a woodsman helped get out the timber to the American fleet. Four of his were in the American army and old gentleman himself enlisted ought during the siege of Platts-

summer of 1813 was a very ex- one. Rumors were afloat that a ful British fleet was being built nada that would come into Lake plain through the Sorrel River llowing spring and, supported land army on the west side of ke, would cut off the New Eng- States from those west.

American fleet was rapidly be- uilt and manned at Plattsburg tch the British. The spring of found the English Army in Can- nder General Prevost and their under the direct command of in Downey, a veteran who had t under the great Commodore n. The American land forces under the command of General Macomb and the fleet under Commodore Thos. Macdonough.

Early in September there were signs of British scouting parties, and many of them would occasionally stop at my great-grandfather's tavern. My grandfather and his younger brother were home alone with their mother. The evening of Saturday, September 10, all seemed warlike. The army of General Prevost numbering fourteen thousand was upon the scene. Camps were set up in little clearings, and there was a hustle and bustle of cavalry. My grandfather said that officers and others were polite, honest, and orderly.

GENERAL MACOMB

From remarks heard by my grandfather he was sure that the battle would be on Sunday morning, September 11. He resolved to get up real early in the morning and make his way through the darkness and the British outposts to the lake to see the fight.

BATTLE OF PLATTSBURG, IN WHICH MR. MOORE'S GREAT-GRANDFATHER FOUGHT WITH THE AMERICAN FORCES

He was 14 years old and knew all the paths and byways leading to the lake. He proceeded to a point of land known as Cumberland Head. There was a slight breeze from the Northeast. As soon as the day began to break he could see the forms of the enemy ships sailing down from the North, a sight long to be remembered. It was after nine o'clock before they rounded Cumberland Head to sail into the bay.

The British flagship, the Confiance, was followed by the other warships, Linnet and Chub. Cumberland Head cut off the wind and interfered with their progress.

The Confiance made direct for Macdonough's flagship, the Saratoga, expecting to place herself in a position so that she could rake the Saratoga from stem to stern. However, a gun sighted by Commodore Macdonough's fleet crashed through the sides of the Confiance, partially destroying her rudder and rendering her helpless.

COMMODORE MACDONOUGH

She was sufficiently near so that the shells coming from her double shotted guns nearly cleared the decks of the American flagship, Saratoga. The crew that was left rallied and sent such a broadside into the Confiance that they could not man the guns. A cannon ball from the Saratoga hit a spar so that a large sliver killed Captain Downie, the British commander, at almost the opening of the action.

Two of the other British ships were pouring their broadsides into the Saratoga and the battle for a time seemed to be going against the brave Macdonough, but by a quick manner of swinging his ship by cables, he brought the double shotted guns of the entire side of the Saratoga to bear on the Confiance. This so shattered her that she soon struck her colors. The Ticonderoga, Eagle, and Preble were fighting pretty evenly when the Saratoga came to their rescue, finishing a battle which had raged for two and one-half hours. The land forces, learning of this defeat, became panic-stricken and struck out for Canada.

Grandfather said that hundreds of young men who had enlisted in the British army largely for adventure, when they found themselves deserted by their officers, threw away their guns and sought jobs with the farmers and others. Thus the population of Plattsburg and nearby settlements was materially increased.

Joan Moore Burned at Stake

My grandfather often thrilled me with the exploits of his grandfather, Joan Moore, hunter, trapper, and Indian fighter.

Some time previous to the beginning of the last great French and Indian War, 1754—1763, the French claimed the lands bordering the Great Lakes and west of the Alleghanies. They made rapid strides to so thickly populate the country from the Detroit River through the Ohio Valley that the English would find it advisable to keep hands off. The English colonies did not like to see the French settle the country directly west of them and remonstrated to the Mother Country. Consequently Joan Moore was given a commission from the Crown to raise colonial troops and proceed to the disputed territory.

After a few skirmishes he drove the French and Indians across the Detroit river near where the city of Detroit now stands. He then built a stockade and prepared to hold the country he had captured.

A messenger was sent back to the colonists bearing the glad tidings of the success of the campaign. When the information reached the king, he was so delighted that he immediately gave Joan a higher commission and a land grant of several square miles, embodying all the lands occupied by the present city of Detroit and many more.

The messenger returned with the commission from the Crown and the land grant and an order for Joan to return to the colonies to raise a more substantial army and hold the captured country against the French and Indians. Leaving his little band on the shores of the Detroit, Joan proceeded to carry out the king's orders. Returning a few months later he found the stockade burned to the ground and his men massacred. He rebuilt the place, renewed warfare on the French and Indians, and soon had them running pell-mell across the Detroit river.

He made the mistake of his life by following them and setting up camps on the east side of the river. All seemed quiet, but an Indian in the service of the colonists, reported that hostile Indians were skulking around.

DAIRY CATTLE CONGRESS

Students' Judging Contest

THE team from Ames took just about all the high honors in the college students' judging contest at Waterloo this year. Not only were they first, all breeds considered, by a margin of 68 points, but they were first on Guernseys, Ayrshires, Holsteins, and Brown Swiss. The Kansas boys did the best judging on Jerseys. The nine college teams placed as follows: Iowa, Kansas, Wisconsin, Missouri, Minnesota, Nebraska, South Dakota, Purdue, and Illinois.

Clarence H. Thompson of Ames was the best judge, Ted S. Besh also of Iowa was second, and Howard Vernon of Kansas third.

Howard Vernon of Kansas ranked first on Guernseys; Lloyd Turk, Missouri, was the best Jersey judge; C. H. Thompson of the Ames team finished first with Ayrshires and Holsteins; Ted Besh, also of Iowa, did the best work with Brown Swiss.

Dairy Cattle Exhibits

The Guernseys

Judge: W. W. Yapp, Illinois.

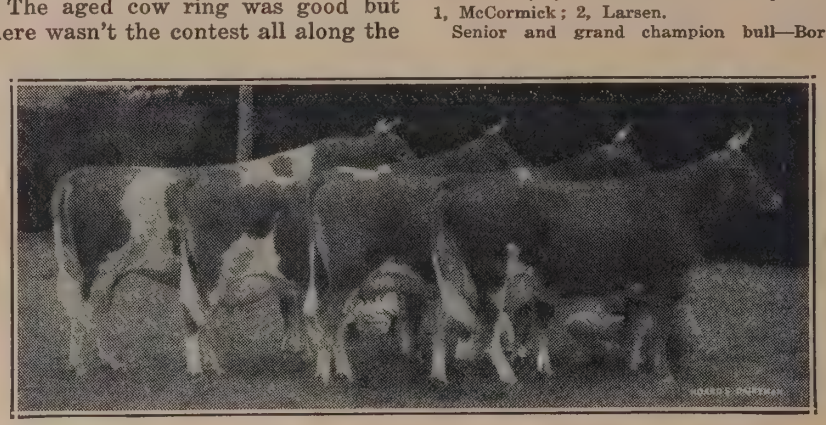
The Guernsey show at Waterloo this year was the best they have had there for several years and in some classes was the best show so far this season. There were upwards of 170 head there with right good tops for every one of the classes and no one or two herds had any monopoly on the top placings as the awards show.

The two best ones in the aged bull class, Border King of Roberts owned by the Larsen Canning Co. and May Rose Cherub from Mrs. McCormick's herd, looked closer than they did at Milwaukee a month earlier, the Cherub bull having improved in the meantime, but Judge Yapp found the Wisconsin entry enough better at the shoulders and over the rump to keep him at the top.

Top place in the three-year-old class was easier, the blue going to Shorewood Farm on Cherub's Golden Secret of Shorewood but the two-year-olds brought out more of a contest. The two best ones here were Cherub's Yank of the Prairie owned by W. W. Marsh and Leader's Bellbuoy of Shorewood owned by D. D. Tenney. The former has an advantage in depth of body and a better rump but he is not so good at the shoulders and it was for that very reason that the judge put him second to the Minnesota bull.

There were three good junior bulls out for championship with Jos. Golinvaux's junior yearling, son of Majesty of the Prairie, the best of the three but neither he nor the other senior bulls were good enough to press Border King of Roberts hard for grand championship.

The best class of the Guernsey show was the ring of three-year-old heifers and it was incidentally the best ring of three-year-olds we have seen for several years. When they finally lined up, Florence of Waldwic, owned by Mrs. McCormick, a very milky looking heifer that needs just a bit more substance, held her place at the top largely because of her unusually good udder. Right below her was a daughter of the grand champion bull owned by Charles Hovey, Iowa. She was by long odds the best bodied thing in the ring with a top to match, but she showed dry without enough udder to beat the top place heifer. Another good McCormick entry, whose udder didn't quite suit the judge, was third, and the grand champion from the Minnesota State Fair, Miss Myrtle of Maple Hill owned by Boulder Bridge Farm, was fourth.



The aged cow ring was good but there wasn't the contest all along the line that the three-year-olds brought out. Imp. County Flower of Langwater, owned by the Larsen Canning Co., was an outstanding top, and second place was just as easy for Mrs. McCormick's Imperial Kitchener's Irene, a mighty well put together cow just short-legged enough to seem smaller than she really is.

County Flower was senior and grand champion and a year-old daughter of Meadow Brook's Danny Duff from the same herd was junior champion.

The Cherubs came into their own in the get of sire class when four by Ladysmith's Cherub headed the line. In the group was the first prize three-year-old bull, the sixth prize aged cow, the second prize four-year-old, and the winning two-year-old heifer.

WINNERS IN COLLEGE STUDENTS' JUDGING CONTEST FROM AMES, IOWA
Left to right: R. Manahan, C. H. Thompson, T. S. Besh, H. Mathews, and F. Ely, coach.

FIRST PRIZE GUERNSEY GET OF SIRE BY LADYSMITH'S CHERUB
Owned by Shorewood Farm, Minnesota

The awards follow:

Bull 4 years or over—1, Wm. Larsen Canning Co. on Border King of Roberts; 2, Mrs. C. McCormick on May Rose Cherub; 3, Radisson Farm on Radisson Bonny Royal. Bull 3 years, under 4—1, Shorewood Farm on Cherub's Golden Secret of Shorewood; 2, H. T. Smith on Faith's Cherub; 3, McCormick on Cantingny's Cavalier. Bull 2 years, under 3—1, Shorewood on Leader's Bellbuoy of Shorewood; 2, W. W. Marsh on Cherub's Yank of the Prairie; 3, Larsen on Queechy's Danny of Fern Dell.

Cow 5 years or over—1, Larsen on Imp. County Flower of Langwater; 2, McCormick on Imperial Kitchener's Irene; 3, Smith on Faith of Chesney Farms. Cow 4 years, under 5—1, Smith on Faith's Wonder of Smithdale; 2, Shorewood on Cherub's Procris of Shorewood; 3, Radisson on Royalist's Beauty of Radisson. Cow 3 years, under 4—1 and 3, McCormick on Florence of Waldwic and Chief's Lady Laura of Guernsey Farm; 2, Hovey on Raider's Golden Lily of Roberts. Heifer 2 years, under 3—1, Shorewood on Cherub's Royal Gem of Shorewood; 2, Larsen on Danny's Farewell Morn of Fern Dell; 3, Ft. Dodge Cry. Co. on Itasca Cherub's Vera.

Young Herd—1, Larsen; 2, Radisson; 3, Golinvaux. Get of sire—1 and 5, Shorewood on get of Ladysmith's Cherub and Cherub's Royal Leader of Shorewood; 2, Larsen on get of Meadow Brook's Danny Duff; 3, Golinvaux on get of Majesty of the Prairie; 4, Radisson on get of Radisson's Golden Royalist. Produce of Dam—1, Smith; 2, Hovey; 3 and 4, Shorewood; 5, Uni. of Illinois. Dairy Herd—1, McCormick; 2, Larsen.

Senior and grand champion bull—Border King of Roberts. Junior champion bull—Majesty's Jasper of Highland Place.

Senior and grand champion cow—Imp. County Flower of Langwater. Junior champion cow—Myrtilla of Fern Dell.

The Jerseys

Judge: C. H. Staples, Louisiana.

There was a better Jersey show this year than in 1926—over 100 from five states, but it wasn't so interesting to watch as were some of the other breeds because it was noticeably harder to follow the judging.

In the aged bull class it looked as though Glory's Interest Lad owned by W. S. Dixon of Wisconsin was quite an easy first but the judge ruled otherwise and put him second to Fashionable Fern Lad, owned by Meredith Jersey Farm. The Wisconsin bull is a better topped, much better middled, and better finished bull that needs only a little more stretch and a better head to make him a strong contender in most shows.

The Oaklands had the only three-year-old and Oxford Noble, the two-year-old owned by H. J. Trost, Wisconsin, but bred and shown by the Oaklands, was a good top to five two-year-olds.

W. S. Dixon showed all three ning juniors and made sure of ju champion but it didn't look lik won it on the right bull. His se yearling, Bessie's Fontaine Duke we think, one of the very best y lings out this year and looked t just about the best Jersey bull at show. A good many had him pi for junior and grand champion the judge awarded junior champ ship to the winning calf and se and grand to Fashionable Fern

In the aged cow class Knight's lie Dear, owned by the Oaklan consistent winner this fall, and cessful Golden Cowslip, grand c pion at Minnesota three weeks lier, were the tops, each cow wi ringside following. The M dith entry, fresh at Minnesota showing at her best, went up ove Michigan cow.

Junior championship was bet the Oaklands' senior yearling, a springer, and Knight's junior y ling, with the Meredith Farm win calf a third choice. The oldest he showing with almost enough u for a milking 2-year-old, won.

Oaklands' winning get of sire Oxford Sultan of Oaklands, incl the winning three-year-old and year-old bulls, the junior cham heifer, and the third prize ju yearling heifer. The awards fo

Bull 4 years or over—1 and 3, Meredith sey Farm on Fashionable Fern Lad Xenia's Sultan of Lehigh; 2, W. S. Dix Glory's Interest Lad. Owned by Meredith Jersey Farm, Iowa

s, not so large a showing as in ; but large enough and good igh to have right good tops in y class and some very good lown the line in most cases. It the best black and white show ar in 1927 and probably will not ettered later.

here were, it seemed to us, three tanding bulls—two senior and junior. Sir Fobes Ormsby Hen-eld, all-American in 1926 and feated this year, was unques-ably not only the best in the aged but the best of the show. His est competitor among the seniors the two-year-old, King Home-l Piebe Lad, owned by J. D. Mc-ald, Wisconsin. He is an up-ling, straight-topped fellow with d deal of style, but right now he so much Holstein bull as is his ar-old rival. Maturity with its equent development may bring ecessary improvement, but that's thing for the future to decide. he best junior bull, DeCreamCo mity Posch, a junior yearling, from Michigan. He is a smooth with a good top and rump and y of length but he would per-be improved with a bit more le and better handling quality. vas an outstanding junior cham-

he aged cow class with its 20 en-brought out some very good none of them better Elmwood Farm's atha Hark Dela-e, the 12-year-old and type cow that been winning con-ntly. Right below a more refined cow d by the Michigan rmatory. She is ididly veined and a good udder, albeit hat is not perfectly iced, but she does have the substance quite the top line of Illinois winner. olger Larsen's 4-old, undefeated in this year, was an top to the 4-year-but she, too, is of more refined type, couldn't beat the old cow for r championship.

rofessor Kildee didn't adhere to rugged, big framed type so close-ith his juniors. He headed the r yearlings with Hargrove & Ar-'s Triune Papoose Piebe, last 's all-American calf, and later ded her junior championship the rather heavy framed, thick-unior yearling and calf. The heifer was unfortunately bred early and because she has milked does not have the flash and m she undoubtedly would other-have had.

. O. Larsen, whose herd has been a consistent winner all fall, is showing an unusually good "get" by Forum Patriarch, the third prize aged bull. In the group are the second prize junior yearling bull, the fourth prize two-year-old heifer, and two good yearling heifers, a uniformly good foursome that deserved its place at the top.

The state herd class with entries from Illinois, Wisconsin, Iowa, and Michigan was excellent and so close that there was but little difference between first and fourth. They placed as named.

The awards follow:

Bull 4 years or over—1, Elmwood Farm on Sir Fobes Ormsby Hengerveld; 2, P. P. Stewart on Tritomia Ormsby Pietertje; 3, H. O. Larsen on Forum Patriarch. Bull 3 years, under 4—1, Femco Farms on Blue Earth Duke Ormsby; 2, C. E. Rudolph on Tower Hill King; 3, J. D. McDonald on Oldenburg Ormsby Pontiac Walker. Bull 2 years, under 3—1, McDonald on King Homestead Piebe Lad; 2, Chapman Farms on Triune Ormsby Piebe 59th; 3, R. E. Maxwell on Ormsby Pietertje Piebe of Merrymax.

Cow 5 years or over—1, Elmwood on Colantha Hark Delaphene; 2, Mich. Reformatory on Tulip Beauty; 3, Detroit Cry. Co. on Bell Farm Hattie. Cow 4 years, under 5—1, Larsen on Long Hollow Mercedes Butter Boy; 2, Elmwood on Oakwood Piebe Ollie; 3, McDonald on Canary Bess Fayne Ormsby. Cow 3 years, under 4—1, Jefferson Co. Asy. Farm on Johanna Pietertje Artis Creamelle; 2, Chapman on Winnemaug Pauline Korndyke; 3, Stewart on Miss Pontiac Aaggie Ormsby. Heifer 2 years, under 3—1, McDonald on Aaggie Segis Pontiac Piebe; 2, Larsen on Forum Diana Masterpiece; 3, Jeff. Co. Asy. Farm on Madam Creamelle Colantha.

Young Herd—1, Jeff. Co. Asy. Farm; 2, Larsen; 3, Elmwood. Get of Sire—1, Larsen on get of Forum Patriarch; 2, Stewart on get of Tritomia Pietertje Ormsby; 3, McDonald on get of King Homestead Piebe De Kol; 4, Hargrove and Arnold on get of Triune Ormsby Piebe; 5, Jeff. Co. Asy. on get of Dutchland Creamelle Denver Prince. Produce of Dam—1, McDonald; 2, Larsen; 3, Christ and Braman. A. R. Cow—1 and 2, Larsen on Long Hollow Mercedes Butter Boy and Forum Pontiac Queen; 3, Chapman on Korndyke Alcartra Albino Dairy Herd—1, Larsen; 2, Elmwood; 3, McDonald. A. R. Get of Sire—1, Tritomia Pietertje Ormsby; 2, Sir Johanna Fayne Segis Pontiac.

Senior and grand champion bull—Sir Fobes Ormsby Hengerveld. Junior champion bull—DeCreamCo Calamity Posch.

Senior and grand champion cow—Colantha Hark Delaphene. Junior champion cow—Triune Papoose Piebe.

MARQUIS DE FARCEUR, FIRST PRIZE 2-YEAR-OLD AND RESERVE JUNIOR CHAMPION BELGIAN STALLION
OWNED BY BOULDER BRIDGE FARM, MINNESOTA

out the best bull of the show, Maiden's Vronicka's College Boy, a remarkably well turned four-year-old owned by J. F. Zoller of New York. He has been undefeated so far this year and was by far the best bull of his breed at Waterloo, although there were a number of other right good bulls shown. He was, of course, senior and grand champion. A twelve-month-old calf, also owned by Zoller, was junior champion.

The aged cow class this year should have interested any dairy cattle man whatever his breed affiliations, because it brought out just about the best of the breed from both a type and production standpoint. At the head of the line was June's College Girl, a big, well topped, strong bodied cow with a good udder. She leads her breed with 1,062.5 lbs. butterfat for a year's production. Next to her stood Silver Bell that produced 772 lbs. fat in the 10 months' division. Immediately below her was Goldie Merrillan that produced 873 lbs. butterfat as a 4-year-old and in fourth place stood Swiss Girl that is now on test and has produced 550 lbs. fat in 6 months. In fifth place was Betty of Lake View, a prize winner for years that has a 2-year-old record of 514 lbs. butterfat. It is seldom indeed that the top cows in any dairy cattle ring combine type with production as did this group.

The younger females, too, showed the marked improvement this breed has been making the past few years. There were good ones to head every class and the judge didn't always find it easy to pick his top.

June's College Girl was senior and grand champion and J. F. Zoller's senior yearling daughter of Vronicka's College Boy was junior champion.

First on get of sire was quite easy for the Zoller herd, their group by Vronicka's College Boy including the grand champion bull and the junior champion heifer with two other good ones.

The awards follow:

Bull 4 years or over—1, J. F. Zoller on Maiden's Vronicka's College Boy; 2, Mooney & Larrabee on Believe of Lake View; 3, N. C. Schmid on Meadow Green John. Bull 3 years, under 4—1, Iowa Brown Swiss Co. on Vogel Boy 2d of Valley Grove; 2, Schultz Bros. on Vogel's Girl's Lad. Bull 2 years, under 3—1, H. A. Mabon on Betsy Bravura Prince; 2, Iowa B. S. Co. on June's College Boy; 3, Mooney & Larrabee on Pride Schoney.

Cow 5 years or over—1, 2, 3, Iowa B. S. Co. on June's College Girl, Silver Bell, and Goldie Merrillan. Cow 4 years, under 5—1 and 2, Iowa B. S. Co. on College Ethel W. and Belle Silver; 3, Zoller on May of Meadow Green. Cow 3 years, under 4—1, Zoller on Carl's Valley Girl 9th of Lake View; 2, A. E. Bower & Son on Beautiful Belle of Bowerhome; 3, Mooney & Larrabee on Pride Ursula. Heifer 2 years, under 3—1 and 2, Bower on Duedda of Bowerhome and Septa of Bowerhome; 3, Zoller on Ester Meg of Wahalla.

Young Herd—1, Bower; 2, Iowa B. S. Co.; 3, Schmid. Get of sire—1, Zoller on get of Vronicka's College Boy; 2 and 4, Bower on get of Edgard C; 3, Iowa B. S. Co. on get of Valley Grove Weiss Boy; 5, Schmid on get of Vronicka's College Boy. Produce of Dam—1 and 2, Zoller; 3, Bower. A. R. Cow—1, June's College Girl; 2, Silver Belle; 3, Betty of Lake View. Herd to consist of 4 cows over 2 years old that shall have calved, all owned by exhibitor—1 and 2, Iowa Brown Swiss Co.; 3, Zoller.

Senior and grand champion bull—Maiden's

IDEN'S VRONICKA'S COLLEGE BOY, SENIOR AND GRAND CHAMPION BROWN SWISS BULL
OWNED BY FRANK ZOLLER, NEW YORK

The Brown Swiss

Judge: C. S. Rhode, Illinois.

The Dairy Cattle Congress always has a strong Brown Swiss show and the one this year was no exception. If one wanted to see good Swiss in the ring, Waterloo was the place to be Sept. 27 and 28. There were well over 100 head there from 16 herds and Judge Rhode lined them up in good shape.

The first class of four aged bulls brought

BROWN SWISS COWS WITH HIGH FAT RECORDS EXHIBITED BY DR. C. F. OSBORNE, IOWA. THEY WERE FIRST PRIZE DAIRY HERD

Left to right: June's College Girl, senior and grand champion, with a record of 1,062 lbs. fat in a year; College Ethel W, that in 230 days produced 502.9 lbs. fat as a 3-year-old; Goldie Merrillan, with a record of 873 lbs. fat as a four-year-old; and Silver Bell, that produced 772 lbs. fat in 10 months.

SEATTLE MILK SHIPPERS' ASSOCIATION

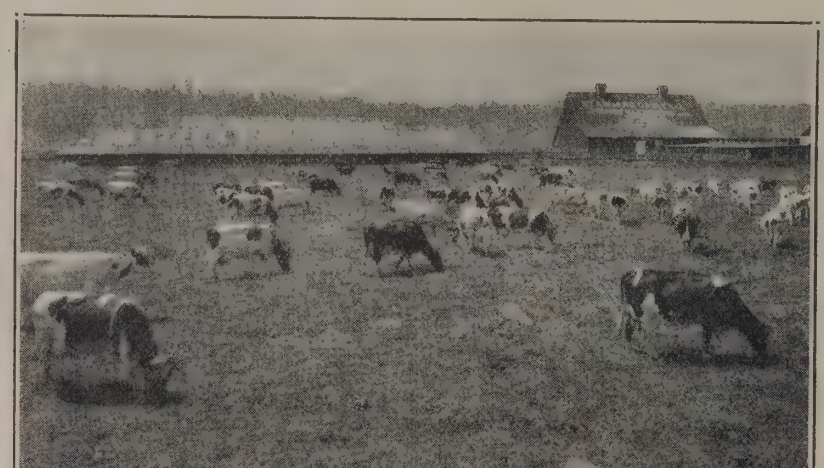
PETER GUYSON, IOWA

THE Seattle Milk Shippers' Association entered upon its seventh year of operation on the first of June, 1927, with brighter prospects for future service than it has enjoyed for some time. Shortly before that, this organization consolidated with all the other co-operative dairy associations on the western slope by affiliating with the Consolidated Dairy Products Company which has for seven years sold all the products of the United Dairy Association and of the various county dairy associations of Western Washington. It is therefore now fairly difficult for any distributing dairy wishing a milk supply outside of the association to go and get any considerable amount. An arrangement has been made with these other counties whereby they will hold their milk out of the Seattle market until it is needed.

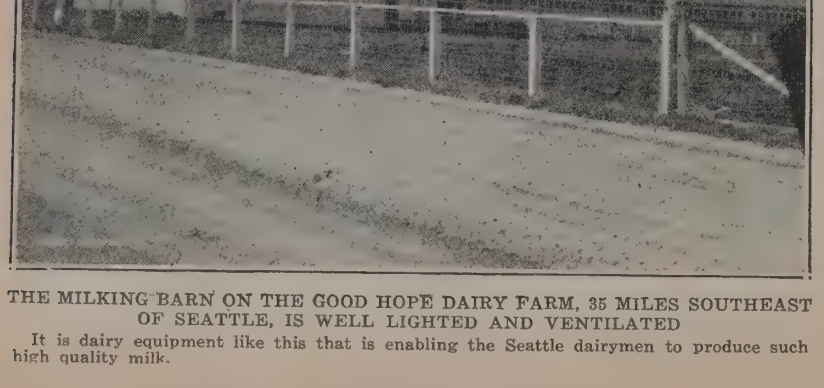
In telling about the change, Chas. E. Smith, secretary of the Shippers' Association, said: "The business is handled just as formerly except that the checks from our customers are made to this Consolidated Dairy Products Company and we are paid in a lump sum by them. We have now secured contracts from practically all the dairies in the city whereby they agree to take their entire supply from the Milk Shippers' Association except such milk as is under contract. This means that we handle between 65 to 70 per cent of the total milk supply of Seattle. The remaining 30 per cent to 35 per cent is provided by a few raw milk dealers who will sell their own milk and by one of the other co-operatives whose supply was contracted for three years ago. This latter supply will continue to come in under our contract with the consolidated."

Secure Better Surplus Price

The Seattle milk price is based on condensery prices. During some periods of the year there is a considerable surplus above what can be used in the city, so the problem has been to dispose of this surplus at higher than condensery prices. Due to the better bargaining position after the consolidation, this has recently been accomplished so at present the shippers get a net income of at least 15 cents per cwt. over any former rates for all surplus milk. One arrangement is with a condensery for the surplus that originates nearby.



The condensers through competition have been giving a free haul for some time. Smith said: "This made it rather difficult to get very much extra, but we did secure an arrangement whereby in consideration of our consolidating the supply in one place, we receive 30 cents over what was the condenser price delivered at the plants. This nets the farmer 15 cents at his place after delivery charges have been deducted. For any other surplus originating in territory adjacent to this particular condensery, we have a contract with an ice cream company that nets us from 40 to 45 cents more than condensery prices delivered in Seattle. If we consider the haul at about 25 cents per cwt., this gives a net at the farm of 15 cents or better over condensery prices. It assists very materially in maintaining a good spread for our city supply which is now fixed at 80 cents over condenser."



CHAS. E. SMITH, SECRETARY AND MANAGER OF THE SEATTLE MILK SHIPPERS' ASSOCIATION

Seattle's milk supply is produced largely in a territory extending north to Stanwood, east to Snohomish, and south to Tacoma. One shipper lives on Bainbridge Island but he markets most of his supply at a country club. The 365 members of the association are mostly Scandinavians, Swiss, and Hollanders. Some of the shippers send in from 10 to 15 gallons a day, many of them send from 200 to 300 and the largest shipper markets from 60 to a hundred cans daily from his 375 cows. Practically all of the milk is brought into the city by trucks over the fine network of roads that forward looking highway departments have built. Only 15 or 20 cans are shipped in by train and Smith says these have been shipped that way for 20 years.

In the shipping association territory surrounding Seattle there are seven different communities and it is in the organization of these communities for airing of opinions that much of the cause for the present harmony lies. Charles E. Smith, ably assisted by the present board of directors, H. M. Shaffer, Herman Nelson, August Anghern, and E. T. Short, with a few others, perfected the work of organization. Each community elects its own chairman. The affairs that pertain particularly to that community are taken up by this group and brought to the attention of the office of the association. If any matter is of general importance to the association, Secretary Smith has the situation so well in hand that he can see the seven community chairmen by driving one day. Then with the telephone these chairmen can get in touch with a large number of their neighbors and in a short time the matter is well understood by the whole community. As a result, the chances are that the vote is right when a vote comes, because the members have had an opportunity to discuss the problem before it is put to a vote.

HENRY KLEINBERG'S HERD OF HOLSTEINS WHERE AN AVERAGE OF 700 GALLONS OF MILK A DAY ORIGINATES FOR THE SEATTLE MARKET

THE MILKING BARN ON THE GOOD HOPE DAIRY FARM, 35 MILES SOUTHEAST OF SEATTLE, IS WELL LIGHTED AND VENTILATED

It is dairy equipment like this that is enabling the Seattle dairymen to produce such high quality milk.

Progress Supplants Chaos

The editor suggests that Hoard's Dairyman readers might be interested in the methods that have been employed to bring about the strong position the shippers' association now enjoys on the Seattle market compared with the chaos that exis three years ago, so we asked Smith to relate them. He says: 1925 the association was just em ing from a bitter fight which was tered into after a very short-sigh policy had been established; nam that of trying to maintain the no that the Seattle market belongs clusively to members of the Sea Milk Shippers' Association. Th was an entire lack of any co-op tive spirit between this associa and other farm co-operatives an was largely due to this fact that other farm co-operative, located Snohomish County, agreed to tract a certain portion of its milk a certain very large distributor had been a customer of the Sea Milk Shippers' Association.

"This fight brought about downfall of the Board which been governing the association several years and placed in charge entirely new board and managem While there had previously been tracts with the various dairies to s ply them their milk, due to the that we were really a pooling orga zation and that we had by this fi about 8,000 gallons of surplus struggle with, the new managem had to adopt a new policy enti and sell milk to anybody who wo buy it. If they would buy part their supply of us, we sold it. E during this time some were loyal bought their entire supply, altho to be fair, we did not compel th to do this.

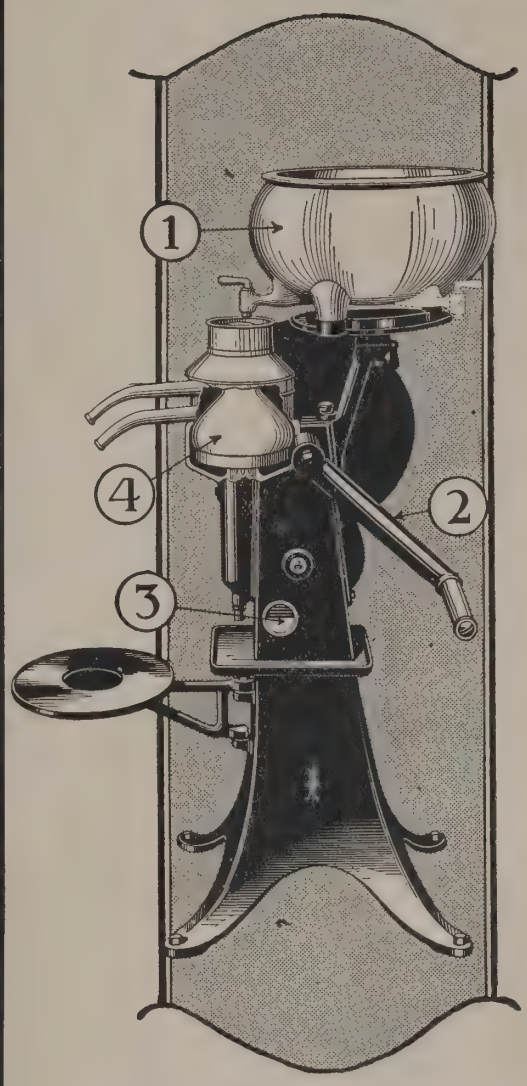
"The building of the new orga zation came through a constant tempt on the part of the managem and the board to give the best serv possible to our customers and gradually win back their favor win back their trade. At the pres time this has been accomplished t very large extent and our volum now as large, if not larger, tha was before the disastrous fight. of the strong features in gaining market has been in the developm of quality. The dairies have co peted with each other to secure best shippers available. With membership situated nearby the c it has been largely within our m bership that these best shippers h been found. We have aligned o selves with the Health Departm and with the distributor in such manner that the best milk secures best market.

"Whenever the milk of any certi member is complained of by the ph receiving it, we have gone to the sh per and have warned him that un he keeps the milk absolutely up t high standard, the chances are v strong he will lose his market someone who can produce better m can take it. If his milk is not g enough to obtain and hold the market, the Health Department t him from the city trade and we him from the pool. He therefo simply gets a surplus price, which very much lower than the city pr he has been enjoying. A week or of this kind of treatment usu makes a good shipper out of h This three-cornered arrangem thoroughly co-operative, namely, w the Health Department, the distr utor, and the producers' organizatio is rapidly building a better and bet quality in the milk supply and leading the distributor to the po where he prefers to get milk which being controlled and improved in manner."

It may be of interest to note h

ne of the regulations that Seattle's alth Department is enforcing to p her milk supply at the high level a 96-score even during the summer nths. Milk samples are taken at ular intervals from every herd ducing milk for Seattle trade. ch dairyman is then scored and the ults are given to the milk distribu- s who in turn try to get their sup- from the better shippers.

Milking barns must be sealed if re is hay or any room overhead. is single ruling helps to account the many low milking barns that sees here. No manure may be pped nearer than 50 feet from the king barn. The gutters must be ht. The stable must be washed or ayed with whitewash. Cobwebs st be broomed down. Udders uld be cleaned with washing cloth. vered milk pails must be used. A rugated cooler large enough to ac- nmodate all the milk must be in- lled. Many dairymen have steam rilizers that use coal or wood, ile others have installed electric ters to meet the various sanitary ings that apply to the care of nsils. It takes time and money to nply with all these requirements, they have all helped to boost the rage city milk consumption so it paid in dollars as well as in the owledge that a clean, wholesome duct is being made.



Cement Friendship With County Co-operatives

Smith believes that one of the more asant features of the recent work the Seattle Shippers' Association been in the cementing of friend- p relations with other co-operative stern slope associations. He said: he Snohomish County, Skagit unty, and Whatcomb County Dai- nen's Associations were formerly mbers of the United Dairymen's sociation, which included practical- all of the Western Washington ry activities. The United Dairy- n's Association, I believe, has ken up in a way in various county ts. We are now co-operating roughly with these three associa- ns by the purchase of stock in the nsolidated Dairy Products Com- ny, which for seven years has been ir selling organization. We have refore at the present time elim- ted the fights which formerly were expensive. By paying a small de- tion on the milk to the Consoli- ed Dairy Products Company, reby helping to carry its over- d, we have secured resolutions m these other counties not to mar- their milk in Seattle until it is ded, thereby rather guaranteeing t the market will be kept stable. I ght say in this connection that the ributors who are our customers e welcomed this co-operative move our part and feel that it protects m no less than us, because any it or disturbance in the milk in- try is bound to affect them ad- sely.

Improvements in Association

"In our reorganization," continued ith, "there was a complete change olicy from the one which obtained the first years of the association, en a few leading lights seemed to elop its laws and manage all its rations and who managed its poli- through a strong proxy vote, ich they usually had with them on occasions. Voting by proxy was minated in 1925. Since then any nge in policy, except in minor de- s, has been worked over by the ard, secured its support, and then taken time to get out over the ritory to the Community Chairman l thence to their community clubs a complete and exhaustive dis- sion before being brought to a final vote. In this way, entire confidence has been secured and it is almost a foregone conclusion that if a matter has real merit and will work out for the good of the association, it can be put over by this method, notwithstanding the fact that if it were sprung at a big meeting when there was little time for discussion and when some enemies to progress might do some "spellbinding," it would be lost. I do not mean to say that we do not have our difficulties. We do, but we believe that this method of dealing with the co-operative institutions will gradually overcome them with the least possible danger to the organization. The politics of the association have now come to be handled through these community clubs in the same way and we could not well help it if we tried. In this also, I believe, is its strength, because any matter if properly argued out will usually develop the sensible side and the vote will be right."

The Best De Laval Ever Made

THERE are already thousands of these New Series De Laval Separators in use and owners everywhere say they are the best De Laval Separators ever made—and that means the best of all.

New Features

1. Turnable Supply Can. A handy feature — saves time, lifting and stooping.

2. Easier Turning. These new De Lavals are easier to start and turn than any others.

3. Oil Window. This new feature enables you to see how your separator is being oiled and shows you the condition of the oil.

4. Floating Bowl. Self-balancing, runs smoothly and without vibration; delivers a smoother, richer cream, and requires less power.

Trade allowance made on old separators.

See your De Laval Agent or write nearest office below.

Idaho Dairy Course

A five months' short course in commercial dairying is announced for this winter by the Idaho College of Agriculture at Moscow. The course, which extends from October 26 to March 28, will be the most complete of its kind offered by any institution in the West.

No tuition is charged and anyone over 17 years of age is eligible, although it is urged that the student should have at least an eighth grade education.

Students are assisted in getting positions after they have earned their certificates. Of 51 graduates in recent years 45 have taken up dairy manufacturing work, four entered the dairy production field, two continued in the four-year course in dairy husbandry. Three are already owners or part-owners of their plants and 11 are managers or superintendents.

A Correction

In our September 25th issue in the report of the Minnesota State Fair, the Meredith Jersey Farm was wrongly credited with but one blue ribbon won. Their herd won three firsts and premier exhibitor banner.

EDITORIAL COMMENT

EXPERIENCE PAVES WAY FOR CAPITAL

Experience in dairying is a mighty valuable thing to have had before one starts into doing things for himself. Some folks have the notion that all that is necessary for success in dairying is to have unlimited capital or credit with which to buy good cattle and build fine barns. Capital or credit is a fine thing in dairying if coupled with intelligent direction, but without sound experience it is a dangerous undertaking and explains why some men fail with cows.

Nowhere have we seen the value of experience coupled with limited capital so forcefully demonstrated as on the E. E. Price farm in Newaygo County, Michigan.

As we were walking across a field to a pasture to look at some cows, Mr. Price said, "When wife and I started we didn't have much capital so we had to make experience take its place."

Mr. Price got his experience first by testing cows and working on good dairy farms. Thus when he dared risk the thousand dollars he had saved on his own farm and herd, he had confidence in his ability to do the right thing at the right time.

Experience begets confidence which leads to unabused credit. After that, capital is not only more easily obtained but it also is used with greater efficiency.

FEEDING VS. BREEDING

A great many farmers seem to be unable to keep these two great dairy principles apart and adjust their minds so as to measure each for just what it is worth. One man will say everything is in feeding; another, everything is in breeding. The old law in logic, "never compare things that differ,'" comes in here.

Breeding cannot take the place of feeding nor can feeding take the place of breeding. A wagon is composed of wood and iron. The man who is judging a wagon and looks only to the wood will get fooled. So, also, if he looks only to the iron. In caring for it he must oil the iron gearing and paint the wooden parts. It won't do to reverse this practice.

Now a dairy cow is made up of breed and feed. We cannot measure what we shall do in one by the other. We breed to produce a certain type of a cow, with certain inherent dairy characteristics in her.

Then we feed her according to those dairy characteristics to support the action of a specific dairy function that we have bred to produce. We must keep these two principles always separate in our judgment and practice.

CONFERENCE ON FERTILIZERS

Representatives of experiment stations, the United States Department of Agriculture, the farm press, and the manufacturers of commercial fertilizers met recently in Louisville, Kentucky, at the call of Dr. Tait Butler, editor Progressive Farmer, for a conference on commercial fertilizers. Advancement in knowledge and a desire for greater efficiency created a demand for certain changes in the commercial fertilizer industry. Men interested in this industry and in growing better crops devoted two days to discussing fertilizer problems and made a number of recommendations which, if followed, will simplify the manufacture of fertilizers and give more information to the farmers who use them.

Fewer grades, simplified labeling, and higher quality were urged and approved at this conference. It was recommended that the term acid phosphate be changed to superphosphate, because of the misunderstanding of the word acid. Increased appropriations were favored for soil research, soil demonstrations, and soil extension work. It was strongly urged that experiment stations unify and co-ordinate their work in fertilizer research and to publish popular reports of soil investigations.

The whole trend of the conference was to effect changes in the fertilizer industry that will assist farmers to understand its products better and to provide ways and means to obtain the most profitable returns from their use.

CHICAGO MILK PRODUCERS

We believe the work of the Pure Milk Association deserves a larger membership of milk producers to assist in making this association a still more serviceable institution.

To increase the membership of the Pure Milk Association, a series of meetings will be held from Monday, October 24, to Saturday, October 29, in the Chicago milk district. Speakers at these several meetings will be H. D. Allebach, president and manager of the Inter-State Milk Producers' Association, Philadelphia; I. W. Heaps, secretary and treasurer, Maryland State Dairymen's Association, Baltimore; and B. F. Beach, assistant secretary, Michigan Milk Producers' Association, Detroit.

These men have had large experience in organizing, developing, and directing successful co-operative enterprises. The meetings should be well attended for the speakers are able to give useful information to those looking for co-operative knowledge and desire to join an organization formed upon a basis that will permit it to succeed. Further, milk producers in the Chicago territory need a strong, well organized co-operative marketing association. The Chicago milk territory has been in a turmoil for the past 25 years and it is time for the milk producers to get together and quit penalizing themselves.

TREBLING INCOME

"Cows that produce twice as much as the average cows of the United States require only 40 per cent more feed."

This statement by the United States Department of Agriculture is based on the examination of 100,000 yearly records made by cows in cow testing associations. Comparisons were made not only on the cost of feed, but also on the amount of digestible nutrients consumed. In both cases cows producing 9,000 pounds milk consumed approximately 40 per cent more digestible nutrients and had a 40 per cent higher feed cost than cows producing 4,500 pounds milk.

But the story does not end simply with the cost of feed. What we are all interested in is profits. While feed costs increased 40%, the income over cost of feed was nearly trebled. When the cows were divided into groups according to production, it was found in the group averaging 155 pounds fat that the cost of feed was $50 and the income over cost of feed was $34. In the group averaging 299 pounds fat, not quite double that of the previous group, the cost of feed was $68 and the income over cost of feed was $96. The second group exceeded the first by 93 per cent in the production of fat, by 36 per cent in cost of feed, and by 182 per cent in income over cost of feed.

Trebling profits by doubling production is pretty good evidence that high production pays. We have always known this in a general way, but it is comforting to get evidence of such a character that it cannot be successfully controverted. It pays to feed the cow properly and keep records so that one may select the better ones for breeding, all of which is concisely stated in the slogan—"Feed, Weed, Breed."

PRICE AND SUPPLY

The price of milk in districts supplying New York City is being contracted for at the rate of $3.00 per 100 pounds 3% milk, and for a period of three months. Dairy farmers with good cows and who otherwise manage their business will find this price remunerative. They will not flow in riches, to be sure, but the price of $3.00 per 100 pounds 3% milk places these milk producers upon a proper relationship with other industries. The secret of prosperity for all industries is one of proper relationship. Under our present economic condition high prices are a good thing but what we are all concerned about is the purchasing power of a d work.

A lesson should be drawn from the present of milk in New York City, namely, that a price can be secured for a product when it is produced in excess of market demands.

In working out a plan to stabilize prices a l erroneous opinions have been expressed. S have gone so far as to declare that if farmers properly organized they could set the price on t products and would not be forced to sell their modities at unreasonably low prices. This is sound advice. We do not know of any indu which is sufficiently organized to hold price profitable levels when there is constant over duction. The chief cause of low prices for n agricultural products is not due to disorgar agriculture so much as to overproduction. producers in the New York milk shed are be ing organized and without question they have able to sell their milk at a better price through ganized effort, but the factor that has had largest influence on raising the price is the sc ty of milk. This should be kept in mind for fundamental to a proper solution of our agr tural problems.

FARMING INTELLIGENTLY

"They surely farm with intelligence in Wis sin. They don't plant one crop and then sit and wait for it to come true. They are busy al time with their small grains, their dairies, t peas, tobacco, hogs, poultry, and eggs. They contrivers and experimenters. They are true t the proverbs of thrift and caution, always ha more than one string to their bow and never ting all their eggs in one basket."

It shouldn't be gathered from this quot from James O'Donnel Bennett, veteran corresp ent of the Chicago Tribune, that the farme Wisconsin have so perfected their method farming and marketing their products as to i them maximum returns. There are still larg portunities for improving the methods of agr ture in that state and to increase the profits o farmer.

It has been fortunate for Wisconsin that she had good leadership and, in the early years o agriculture, men who saw that diversificatio farming and the dairy cow were what was nee to bring the best returns to agriculture. These believed in organization and urged it on ever casion. While Wisconsin is not as well organ as it should be, yet it leads in cow testing ass tions; it leads in a number of local breed ass tions and it has strong state breed organizat There is a state creamery association, a large federation of cheese factories, a buttermakers' a cheesemakers' association, and a dairymen's ciation. Around many of the larger cities there milk producers' associations well managed rendering their patrons good service.

To hold, as some do, that Wisconsin has little in the way of organization is to fly in the face of facts. The results of her farm opera indicate that there has been well organized fo and nothing is to be gained in minimizing purposes and efforts. It would be equally unwi hold that all farm operations are so well pla and executed and the farmers so well organ that no further effort need be made.

We believe it is well to recognize what has accomplished and then lay plans to secure better results.

Feeding for Profit

In the annual report of the Rockfield Cow ing Association, Alvin Druss gives the follo testimonial as to what testing has done for hi

"There are still a large number of farmers persist in feeding cows with scoop shovels, big dy pails, bushel baskets, and what not. They what they think is right before each cow and even feed all cows alike, fresh ones, old strip

and small ones, poor and fat ones, everything same. The farmers that dairy in that manner as old fashioned and far behind as an ox team a modern farm.

A dairyman knows each cow individually and ls her according to her condition and butterfat duction. How far would any business get if followed the footsteps of some farmers who end to be dairymen?

Henry Ford offered a prize of $10,000 if any- could lower the cost 10 cents in the price pro- tion of a car and still have the same quality. en will farmers be able to say that, especially y farmers in production of butterfat?

After a few calls by the tester, a member, and county agent, I joined the testing association, e realizing what the work could do to build up rofitable dairy herd. Results began to show af- a few tests and I became more interested in work and more careful in purchasing new cows eplace the boarders that were sold. My herd in- sed its production from an average of 234 lbs. to 358 lbs. fat, and the profit over cost of feed eased $88 per cow. Testing is responsible for increase in our production.

Three cows were culled the first year and two ght in their places. Two cows were culled the nd year and two replaced them.

The testing fees are no expense to any dairy- n. Very few investments pay larger dividends."

Is He Right?

"I have just come back," writes one of our lers, "from a visit to the old home farm in a. I took in a few Minnesota dairy farms on way back. I wish that these middle western mers could see the care that is used in the West to produce a high quality of milk, for I eve that we would use far more if we could vince the consuming public that it is cleanly duced. California families in same circum- nces as Wisconsin families order just as many rts of 15 cent milk as these families order of cent milk."

Estimating Hay in Mow

measuring timothy hay in a mow is it custom- to figure 512 cubic feet per ton? I have a about 28x32 feet and 20 feet deep. I mowed ry forkful as it was put in and tramped it well. ng 512 as the number of cubic feet per ton it es me almost double the yield per acre that we ect in this locality.

Palouse, Wash. G. W. H.

It is usually customary to figure 512 cubic feet ay per ton when hay has stood in the mow for ty days or more. After standing for six ths, it is usual to estimate about 422 cubic t to the ton, and where standing in the mow s than 30 days, hay will frequently run up to cubic feet to the ton.

From the fact that the mow is 20 feet deep, we ld be inclined to think that if this hay has od for a month or longer, it should be well pacted and should measure out even less than cubic feet per ton rather than more.

Broom Corn for Silage

am sending you samples of heads of sorghum ch our entire locality planted for silage. We ght the seed for honey sorghum, but it appears be about three-fourths broom corn. The stalks a quite tall, fairly sweet in flavor, but more pithy n real honey sorghum. What do you think of s for silage for dairy cows? Can the company ing the seed be held in any way responsible?

Riverdale, Calif. E. A. P.

We have seen no analyses of the broom corn nt that enable us to make any definite compari- s as to the probable value of silage made from om corn. We anticipate, however, that it would somewhat less valuable than that made from ney sorghum. Analyses of the broom corn seed icate that the seed itself is somewhat inferior feeding value to either barley or corn. This dif- ence, however, will probably not be more than m 10 to 15 per cent. If ensiled when contain- a sufficient amount of moisture, we anticipate broom corn will make a reasonably palatable ge.

Some years ago it was suggested that broom n might be crossed with sweet sorghum so as to duce a plant that would not only be valuable as standard cash crop, but would also make a more irable feed crop. We do not know whether any velopment has been taken along this line, but we know that broom corn and the various sorghums n be easily crossed on one another. It is quite possible the seed secured may be the result of such crossing, which would produce a plant intermediate between regular broom corn and sorghum.

Whether the seller of this seed can be held responsible for its trueness to name will depend upon the seed laws of the state. For information on this subject we suggest writing the State Department of Agriculture at Sacramento, or possibly the State College of Agriculture at Davis. If it is decided to take legal action against the seller of the seed, it might be possible to prove the amount of damages by having the State College of Agriculture analyze representative samples of the silage secured from this broom corn. Indeed, this might be a good thing to do before becoming involved in any expense for legal proceedings.

Abortion Cures and Control

Is there any way to cure abortion in cows? I see many ads for medicine to cure it, but the papers all say there is no cure. I had a dispute with a veterinarian on the subject.

Milford, Mass. W. P. R.

Hoard's Dairyman refuses to accept advertisements of so-called abortion "cures." Careful examination of many cases where these remedies were used, shows that either no good results had been secured or that the owner of the herd was probably ascribing the stoppage of the disease to the wrong cause. Scientific investigators at our colleges of agriculture and the U. S. Department of Agriculture are a unit in advising against the use of these remedies and they tell us that no cure for abortion has yet been discovered.

Our action in refusing this type of advertising has cost us thousands of dollars annually, but we cannot be a party to putting our readers in touch with advertisers who hold out promises that can not be fulfilled and that may keep the purchaser from following the better methods of control. We have sought the country over for the best information available on the control of abortion and have published this for the benefit of our subscribers at no inconsiderable cost to ourselves. We have even gone further than this, for we were privileged to gain the attention and approval of Congress for a specific appropriation for the scientific investigation of this menace to the live stock industry and to ascertain if possible how it may best be controlled.

From our observation of the abortion disease as it manifests itself in the herd, we believe we have ascertained the reason why some men honestly believe a certain remedy has cured their cows. Abortion disease in a herd starts gradually and at first is not given much attention. First one cow aborts, and then some weeks or months later another cow aborts. These abortions are either not noticed because it may be the pasture season and the cow is thought to be a shy breeder, or the abortion will be ascribed to some accident because of fear of the disease and the desire to deceive ourselves and our neighbors. As more cows abort and fewer living calves are produced, the farmer becomes more and more concerned. It is possible when the disease reaches its height that the farmer becomes desperate and finally orders some remedy. After using it for a time, he observes fewer abortions and finally the disease apparently dies out. He is then convinced that the remedy has produced these results and is enthusiastic for it. If the disease strikes his herd again, he recognizes it at once and starts using his "cure" before it reaches its height. It is very likely that abortions will continue and he then comes to the regretful conclusion that the remedy is no good.

The experience reported in the previous paragraph seems to be the same whether one uses a so-called abortion remedy or not. The disease starts gradually, reaches a high crest, and then drops off gradually. We have observed this to be true in many herds. We have seen herds where no-abortion cures were used in which first one cow aborts, then another, and finally a considerable number of calves are lost. It may be that at the twelfth month, or later, more than half the herd will abort and some cows become sterile. After that the number of aborters decreases and, possibly, within two years after the first abortion the disease has apparently left the herd.

We believe the largest hope of success in controlling abortion (there is no cure) comes from an observation of one of the first principles in dairy cattle management—*cleanliness*. This means that aborting cows should be separated from other members of the herd and kept separate until they show no further discharges from the vagina. The barns, pens, and cows should be kept clean and disinfected. In particular, bury the afterbirth from all cows and the aborted fetus and discharges from the aborting cows so other cows will not become infected. Do not breed the cow until the second heat period after she has cleaned properly and shows no further discharges.

The next control measure is to feed the cows a good and sufficient ration. If the herd is not receiving alfalfa or clover hay in good quantities and grown on acid-free soils, it would be well to supply them with bone meal or a good mineral mixture. Indeed, it may be good insurance to supply a mineral mixture as a regular portion of the dairy feed.

The following brief statements give a summary of simple methods of control that any farmer can follow when abortion strikes his herd:

1. Keep the cows from eating material or drinking water that in any way may have become infected with discharges from diseased cattle. It is through eating infected material that the disease spreads from cow to cow.

2. Isolate the bull so drainage or infected material from his pen may not come in contact with or be carried on the feet of cattle or otherwise to the feed of healthy cows.

3. Quarantine served cows until there is no danger of leakage from their vaginas infecting the feed.

4. Have an isolated maternity stable to which cows can be moved shortly before calving and kept two weeks or until all discharges from the vagina cease.

5. Bury the afterbirth, aborted fetus, and discharges from all births or abortions, thoroughly cleaning and disinfecting the calving pens.

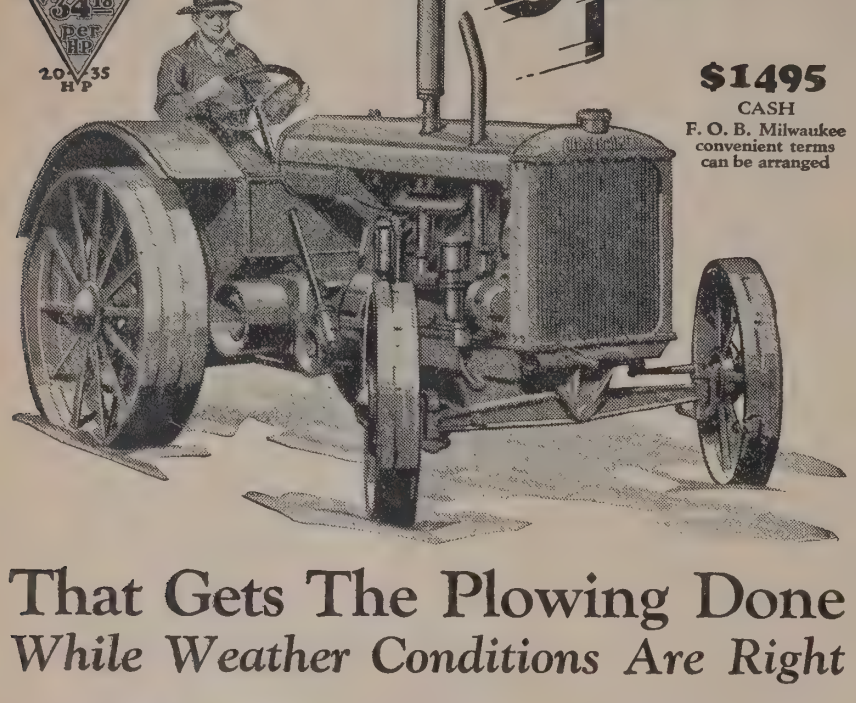
6. Keep clean and sanitary the stable, the yards, and the cows.

7. Build up the resistance powers of the cow by feeding a proper ration that is equal to her needs and that supplies a sufficient amount of minerals as well as feed nutrients.

8. If desired to build up an abortion-free herd, use the test for abortion and dispose of all reactors. It will require consistent and constant attention to reach and maintain an abortion-free herd, just as is required in maintaining a tuberculosis-free herd.

Filling Silo Without Tramping

Please advise me concerning filling silo without tramping and if it really is a success. What percentage can you get in as compared with tramped silage?



Shattuc, Ill. F. B. S.

Each year we are in receipt of an increasing number of reports where farmers have been successful in filling their silos without tramping. In some cases a distributor is used in the silo, but the recommendations of those who have had the largest experience is that the cut corn be delivered into the center from the top of the silo so that it will drop down and form a cone as it piles up. This cone is not leveled off until the top of the silo is reached and it is desired to put in more corn. At the final close of filling the top is merely leveled off. It is claimed that by this method the ear corn, leaves, and stalks are well mixed throughout the silage and that there is even less danger of uneven settling than where only partial tramping is given to the silage. There is no information as to the relative amounts a given silo would hold under the two methods of filling. The general opinion is that under normal conditions the tramping would insure a greater capacity, but this is only a matter of opinion.

We have had no reports of unfavorable experience with this method, but as we have not tried it ourselves, we are not willing to unreservedly recommend it. It would be our opinion that this method would work very well when the cut corn was reasonably moist but that it would not prove out so well with frozen corn or corn that had been permitted to reach more than the usual maturity. It would also be our opinion that silos filled in this manner would settle more after filling than where a reasonable amount of tramping was employed during the filling process. A part of this latter objection is, of course, overcome in the case of refilling a silo as in that case the refilling may be tramped as it is put in. It is also probable that the newer system of filling without tramping will work better in a relatively high silo than in one that is only 20 to 25 feet deep. It is rather reasonable to suppose that the additional weight secured with high silos would be quite as effective if not more so in settling the silage than what tramping might be done during the filling process.

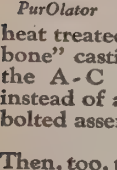
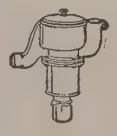
That Gets The Plowing Done
While Weather Conditions Are Right



DEEP plowing — *fast* plowing! That's what keeps the moisture in the ground—gives the most complete turn-under of weeds — brings you big yield from your land.

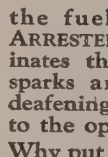
You need *power* for speed — the kind of power that plows *four* deep furrows quickly — instead of two or three.

In the Allis-Chalmers you have it—power that enables you to do *more* work in *less* time. And you have amazing promise of long life, low operating cost and high return on your money.



Note these features that are *standard* equipment on the Allis-Chalmers 20-35. Note the low price for the A-C *complete*. No wonder the word has gone around that Allis-Chalmers is the world's best buy. Send for catalog. *See why!*

This Standard Equipment Doubles the Life of Your Tractor



Oil PurOlator

There's nothing extra to buy for your Allis-Chalmers. It comes to you *complete*, ready to run, with all the latest improvements known to engineers. Big oversize parts to assure long service; forged steel gears with machine cut teeth, heat treated and hardened; a "backbone" casting that makes the A-C a single unit instead of a built-up and bolted assembly.

Air Cleaner

Then, too, the A-C is completely sealed against grit. The OIL PUROLATOR removes all dirt from the oil and keeps the lubricant clean. The AIR CLEANER prevents the entrance of dirt thru the intake. The GAS FILTER strains the most minute particles from the fuel. The SPARK ARRESTER MUFFLER eliminates the danger from sparks and subdues the deafening din so tiresome to the operator.

Gas Filter

Spark Arrester and Muffler

Why put your money into anything *less* than the Allis-Chalmers? Why pay any more when everywhere they are saying the A-C is the best buy?

How Shall Cows Be Compared

HOARD'S DAIRYMAN:—In our cow testing association work we usually find that poorly fed cows (which are thin cows) have a lower feed cost per pound of fat than do cows kept in good condition. In face of the fact that all feeding authorities are saying "feed the cow well," this leads the layman to think that some one is "out of tune." To me it seems misleading and unfair to compare the desirability of dairy cows only by the feed cost per pound fat or hundredweight of milk, or by the returns for a dollar expended for feed.

To explain let me illustrate by a couple of problems, perhaps slightly exaggerated, to bring out the point. First, let us take a thin cow pastured on wildland for seven months of the year at a charge of seven dollars. In the other five months she consumed a ton of timothy hay at ten dollars. Assume she has a feed cost of seventeen dollars and her production o pounds fat is valued at $63. would then have produced this f a cost of 12.1 cents per pound, would give a return of $3.70 for dollar expended for feed.

Now let us take a cow which duced 500 pounds of fat value $225. This cow consumed pounds of grain at $52.50, pounds alfalfa at $12.50, 5,000 po silage at $12.50, and she is cha with $12.50 for legume pasture, ing a total feed cost of $90. This in good condition would have duced 500 pounds of fat at a co 18 cents per pound as compared t cents for the thin cow. She w have returned $2.50 for each d expended for feed as compare $3.70 for the thin cow. Yet the p it above feed cost with the thin was $46 as compared with $135 the cow in good condition.

It can readily be seen which o of the two cows can butter his b the thickest. The small amount

STUDYING THE RECORD

The herd record book doesn't help greatly if tucked away on the clock shelf as soon as the tester leaves. Members who do this do not get full value for the money they have paid, and they are most often those who do not stay in the work for more than a year.

orly fed cow could produce would course be all profit if nothing was nt in so far as feed cost is con- ned, but the volume of her busi- s would be so small she might be ebted to her owner if overhead and or were to be considered.

The feed cost per pound of butter- or the returns per dollar expend- for feed at which a cow performs f great value in comparing individ- cows within a herd. But it is of real value in comparing cows on farm with those on another; ecially is this true when widely arated, due to local markets on ds and products.

To know the value of a cow's abili- as a producer it is necessary to sider along with the costs of pro- tion the volume of business she do and the profit above feed cost.

W. A. SANSON, Tester.

Fit the Program to the Member

HOARD'S DAIRYMAN:—Last spring ut the time farmers were plan- g for this year's crop rotation one the members of the South Kent, higan, association who is not in d financial condition was undecid- whether he should buy grain for cows on pasture with butterfat at cents and feed prices high, or save t money and buy seed to sow the at crop that will help him in feed- his cows the coming winter.

Alfalfa was purchased on the und, also some harvested on shares, some soy beans sown. He also nted some silo corn and is now ting to build a silo. This winter wants to draw marl and next ing seed alfalfa and sweet clover. d prices are the highest during the ter and the better the grade of ghage fed, the cheaper the grain on needs to be. Therefore to get best out of cows they must first the right feed, then those extras be fed.

It is the duty of a tester to study se feed bills best suited to the mer's means, and members should nk of a C. T. A. as being an invest- nt instead of an expense.

FORREST BENDER, Tester.

Loss of Fat in Separator

HOARD'S DAIRYMAN:—During my t fifteen days' work as tester in n County, Minnesota, over half separators which I tested were ving too much butterfat in the nmilk. The amount of loss varied m $8 to $25 a month when figured he present price of butterfat.

You may say the skimmilk is fed the pigs and that they get what terfat is left in the milk. That is well and good, but why pay forty ts a pound for something you can for less than two cents which is grain costs. The oil and starches nd in the grains are as good a rce of these substances as is but- fat.—O. BRUCE GOCHNAUER, Tester.

Co-operation

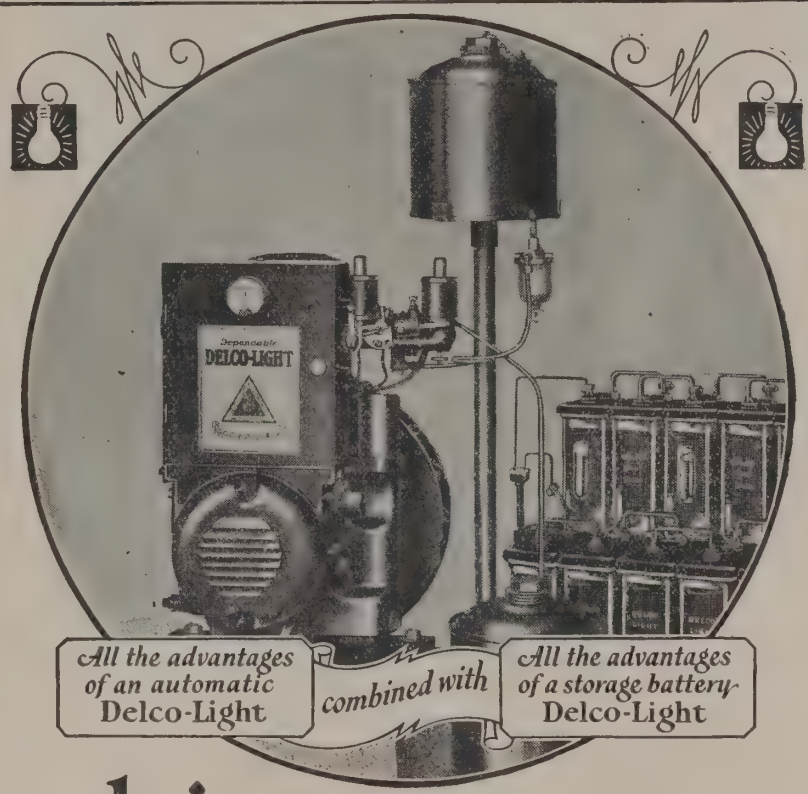
HOARD'S DAIRYMAN:—I would give following as some of the reasons y members in a cow testing associ- n fail to see the value of C. T. A. rk:

1. Members don't like the tester.
2. Member thinks he knows more ut feeds and feeding than the ter.
3. Lack of co-operation with test- or other good cow men.
4. Irregularity in feeding, milking, l caring for cows.
5. Handling cows roughly, leaving vs out in the cold, drinking ice cold ter, and having a cold barn in win- .
6. In the association only to make ords.
7. Just wants to be a member.
8. Doesn't like to pay the $3 a day and supply board and lodging to the tester.
9. Believes their fellow neighbors to be dishonest and tries to make dishonest records himself.
10. The use of poor dairy sires.

I believe much good would be accomplished if tester and members would become associate members of the 4-H club and live up to the 4-H club pledge: "I pledge my head to reason, my heart to loyalty, my hands to service, and my health to efficiency for the good of my country, my community, and my home." And we might add to this pledge, "make the best better." We then would surely accomplish what the cow testing association is working for, namely to increase the average production of dairy cows, and to feed for the most profitable production.

PETER NELSON, Tester.

High Cost of Separators



HOARD'S DAIRYMAN:—The regular testing of skimmilk by the C. T. A. tester goes far toward paying the annual fees of a cow testing association. During the past year, by daily testing the skimmilk, I found some robber separators. Out of the 26 separators tested during the year three were replaced by new ones. One of the separators that was replaced stole 35 cents in butterfat daily, which would pay for a good new separator in a year.

Another separator has been in continuous use for over seventeen years and doesn't sound or look very good. If this separator had been judged by age, sound, or looks it probably would have been replaced. I tested this separator 12 times; once it tested .03 of one per cent. The other eleven times the skimmilk from this separator tested .02 of one per cent or less. This C. T. A. member, by having his skimmilk tested regularly, is saving by using his old separator and he knows he isn't being robbed.

During the month of September I tested skimmilk samples from ten separators in the Milton, Wisconsin, Association. Two were losing money; one was only doing fair work and seven were doing good work.

ALFRED STEEN, Tester.

Uncle Ab says that about the worst thing that can happen to a man is to be deprived of the chance to work.

See this New Scientific Marvel

New Type Delco-Light Plant Does Everything but Think!

IF you think all farm electric plants are much alike, see this new achievement of Delco-Light and General Motors. Here is a Plant that wins alike the enthusiastic acclaim of scientists, engineers, electrical experts and laymen.

Small Loads from Battery

With this new type plant you can use up to seven or eight electric lamps and draw the necessary current right from the battery. Thus the engine runs infrequently. Less fuel is used. But throw on a heavier load and the engine starts—instantly and automatically—generates enough current to carry the heavier load—*plus a surplus supply to recharge the battery!* Thus only a small battery is needed. And even this lasts longer.

Science Marvels

Even engineers who are in daily contact with the newest trends of electrical science marvel at this Delco-Light achievement. For it's almost human in its action. An automatic throttle speeds or slows the engine to synchronize with load demands. An automatic choke makes starting quick and certain—even in cold weather.

Automatic pilot balls—another patented feature—show at a glance the condition of your battery. Easy to tell about. But fifteen years were devoted to intensive research before this scientific marvel was perfected. Even then is was not approved by General Motors until seven years of grueling field tests proved it worthy.

Low Cost, Too

Yet, you pay no premium for all these new and revolutionary features. The entire plant—complete with 16-cell battery—is offered at a price so low that it's well within the means of all who want it.

Other Delco-Light Plants as Low as $225

See this new Delco-Light plant that is now being discussed so widely. Write or 'phone the nearest Delco-Light distributor. And remember—if this new plant doesn't exactly fill your needs, there are many other models to choose from—priced as low as $225!

Mail Coupon for Free Books

In the meantime, read an interesting illustrated book now offered free—"A Day and a Night with Delco-Light." To those who answer promptly, we'll include "The Miracle of More Eggs"—a valuable book for poultry raisers, large or small. Don't wait. Read the facts and weigh the evidence.

Subscription Rates

Subscription in United States and Mexico three years for $1.00; single year, thirty-five cents. Canada, three years, $2.50; one year, $1.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $1.00 a year; not in Postal Union $1.50 a year. These rates include postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers who farm with businesslike methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received thirteen days previous to the date of publication. Advertising to be classified or changes in advertising must reach us three weeks previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

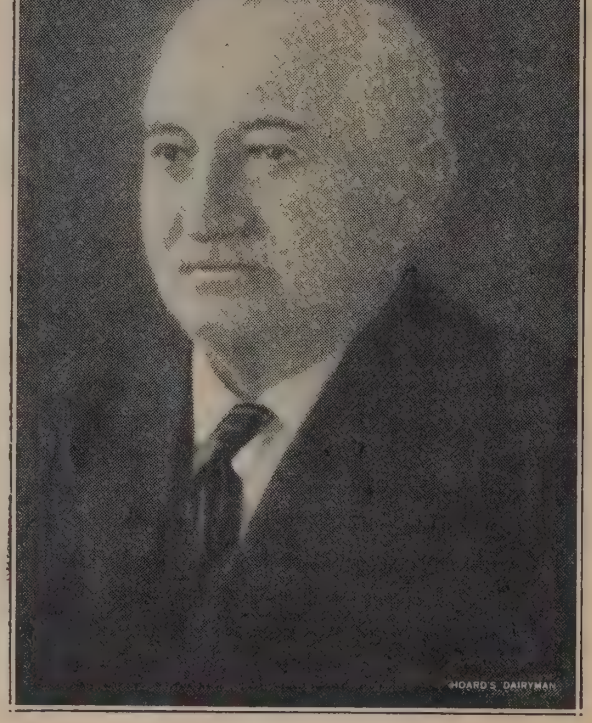
Why He Was Nervous



"Why do you jump at the sound of a motor car?"

"Well, some time ago my chauffeur eloped with my wife, and every time I hear a horn I think he's bringing her back!"

Henry Krumrey, Pioneer Co-operator

HENRY Krumrey began where other men stop. A successful farmer, he was not content to retire when that time arrived in his life but sought new worlds to conquer. A great fighter, that man. In the end he fought his heart out for his fellow farmers.

Henry Krumrey has been gone five years. But his work lives on and grows. Would that he were here to see the fruits of his labors. Thousands of farmers are his debtors.

HENRY KRUMREY

The great Wisconsin Cheese Producers' Federation of which he was the founder and first president, now doing an annual co-operative marketing business of eight million dollars, stands as a monument to the name and spirit of Henry Krumrey.

Within the last fortnight two tablets were unveiled to the memory of this farmer benefactor—one on the Agricultural College campus at Madison, Oct. 13 and the other on the Federation ground at Plymouth, Oct. 16, the cheese "capitol." Men of national prominence paid tribute to the memory of Henry Krumrey, the man who gave unstintingly of his time and best efforts that the producers might market their own cheese.

"Think for a moment of Krumrey as he pioneered in the co-operative movement of this state," said Professor Macklin of the Agricultural Economics Department at the University, in his address at the Madison program. "Was it easy for him? Did farmers and cheese factory organizations fall over themselves to join in the Federation? Far from it. Those who labored in this state wide undertaking know what indifference, prejudice, and opposition Mr. Krumrey had to cut through. His cutting tools were men and facts.

"What caused him to rise to prominence while around him thousands first farmed and then retired into obscurity? There is but one answer. He loved his fellow farmers. He wanted better things and thoughts, more means and higher ideals for his neighbor and his neighbor's neighbor.

"In the sixteen years since Krumrey started active work along co-operative organization lines no less than 48,000 farmers have retired from Wisconsin farms. Think of the will power and physical energy of this army of mature, experienced men had they been imbued with Krumrey's ambition! Henry Krumrey has paved the way for awakening this storehouse of human energy that annually goes too largely to waste. Through the years to come let us hope that his example may become a perpetual power to list men for leadership."

Said J. H. A. Lacher at the ceremonies, in telling of Krumre life, "Henry Krumrey was born F ruary 3, 1852, on a pioneer farm cated near Plymouth. His forebe were for generations either mas craftsmen or grape growers in sur Rhenish—Bavaria. He owed his usual qualities to his father, K Krumrey, who came to Sheboyg County from Germany in 1849. Her Krumrey received a common sch education in Plymouth and shortly ter the death of his parents and marriage of his eldest brother, sumed the entire management of old homestead.

"From early manhood he took active interest in politics serving town treasurer, member of the cou board, and for 14 years he was a rector or president of the Plymo Board of Education. In 1900 he w elected to the State Assembly and the fall of 1908 was chosen to State Senate.

"A dairy farmer, he was satisf with fair returns from his prod until one day in 1911, the Plymo Cheese Board cut the price below cost of production and then he beg his long fight for the co-operat marketing of cheese. It required usual ability, courage, and stayi qualities to carry this fight to a s cessful conclusion. He was abused a threatened, called a crook and a lu tic. There was no rest for him, a for 3½ years he worked without to the neglect of his own affairs."

W. H. Hutter, vice-president of Cheese Producers' Federation, H. Russell, Dean of the College of Ag culture, and United States Sena John J. Blaine were others on Madison program with Henry Kru rey, grandson of the founder, unv ing the tablet. At Plymouth, G Brickbauer, president of the Fede tion; C. E. Broughton, editor of Sheboygan Press; H. C. Taylor, P fessor of Economics, Northwest University; and Ex-congressman I ward Voigt paid tribute to the me ory of Henry Krumrey, and the veiling was performed by Her Krumrey Saeman and Paul Albrec grandchildren.

Butter Improvement in the Northwest

Oregon butter has become a great factor in the prize winning class at all butter scoring contests on the Pacific Coast during recent years.

There is, of course, a reason for this, which becomes apparent when consideration is given to the creameries which have won these prizes. Three years ago an association was organized, including seven creameries in western Oregon and two in southwestern Washington. This association is known as the North Pacific Co-operative Creameries. Mr. Chris Johnsen was employed as fieldman to work among all members to improve the cream supply and standardize the butter output. The effectiveness of the work of this association is indicated by the fact that all prizes at all contests held so far this year have been won by North Pacific Co-operative Creameries members.

Competition has become very keen and the outcome of butter scorings to be held in connection with the Oregon Buttermakers' convention, November 2, 3, and 4, and at the Western Dairy Products Show, October 29 to November 5, will be awaited with keen interest. Further information concerning the program and prize competitions may be secured by writing V. D. Chappell, 211 Northwestern Bank Building, Portland, Oregon.

A Correction

In an editorial entitled, "Tuberculin Test Now," we made the following statement which is inaccurate: "The New York Legislature enacted a law which authorizes competent veterinarians to tuberculin test dairy cows whose milk is marketed in liquid form or manufactured into butter, cheese, condensed milk, etc."

The law says, "The commissioner may cause a physical examination to be made by competent veterinarians of dairy cows whose milk is marketed in liquid form or manufactured into butter, cheese, or other food for human consumption."

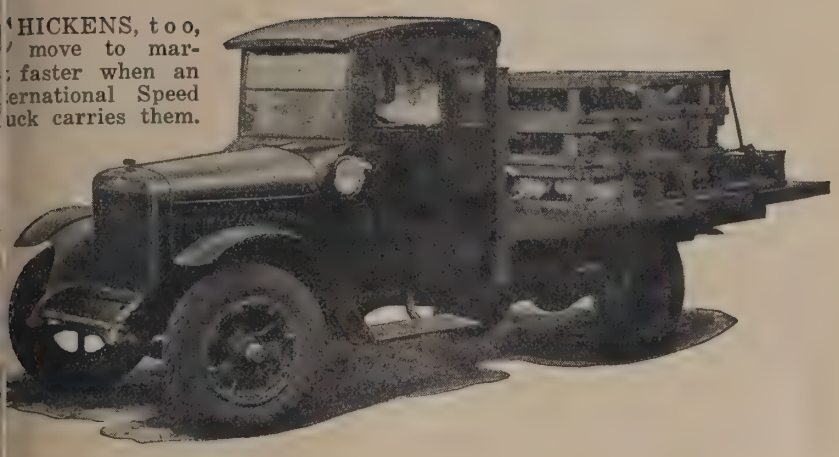
The law further states, "An examination made by any qualified and approved examiner may be accepted by the commissioner. If, from such examination, an animal be deemed by the commissioner to be infected with tuberculosis or any infectious or communicable disease or its condition be such as to render it undesirable for the production of milk or a menace to the health of other animals or p sons, such animal shall be immedia ly removed from the herd, slaug tered, or disposed of as the comm sioner may prescribe."

It should also be stated that af July first, 1928, farmers selling m in villages will be required to eit pasteurize their milk or have th herds tuberculin tested.

We are much in favor of a bet milk supply, but it is unreasonable expect high quality milk to sell the same price as low quality mi The consumer must be taught t good milk costs more to produce a consequently the producer must ceive more for it.

It is an injustice to the farmer demand more labor and larger pense in production and then properly compensate him for t service.

A small boy went to the chem and asked for some powder for sister.



"What kind does she want?" ask the chemist; "that which goes with a bang?"

"No!" answered the boy; "s wants the sort that goes on with puff!"

Speed Truck
or
Heavy-Duty
—the Farmer Sticks to
INTERNATIONAL

IT is no accident that farmers are relying on International Trucks in the process of bringing farm hauling up on the plane with tractor farming and automobiling.

International Harvester equipment has served them in every farming operation for so many years. International Harvester tractors have given them the standard farm power. And they have benefited by the intimate contact with International Harvester service, close by, everywhere in the land.

Most important, they have preferred International Trucks for what they are — fine, sturdy trucks to be proud of, trucks sure to render many years of faithful farm hauling, ready for field and road, for heaviest going. They know that Internationals have been serving tens of thousands of owners in city and town and country, for nearly a quarter-century. And they know of the quality of International service rendered by 136 Company-owned branches.

Speed up your hauling in speed, quality, and efficiency. Own an International — the sizes run all the way from the ¾ ton Special Delivery to the 5-ton Heavy-Duty truck. Let a good-looking International save your time for profitable work. We will mail you an International truck folder on request.

Kelly sales increase 57% in six months

FOR the first six months of this year the sales of Kelly-Springfield tires were 57% ahead of the figures for the corresponding months of last year.

There can be only one explanation for this astonishing showing. That explanation lies in the quality and the value that are being built into the Kelly product.

Car-owners have grown tire-wise. No tire company could show such a tremendous increase in business unless it had been able to demonstrate to tire buyers that it had something out of the ordinary to offer.

Kellys cost *no more* than a great many other makes of tires.

4 TIMES Around the World with ONE OILING

100,000 Miles Without Stopping for Oil

An inventor who could develop an airplane which would perform such a feat would be considered a wonder. But such is the record of regular accomplishment by the Auto-oiled Aermotor in pumping water.

Did you ever stop to think how many revolutions the wheel of a windmill makes? If the wheel of an Aermotor should roll along the surface of the ground at the same speed that it makes when pumping water it would encircle the world in 90 days, or would go four times around in a year. It would travel on an average 275 miles per day or about 30 miles per hour for 9 hours each day. An automobile which keeps up that pace day after day needs a thorough oiling at least once a week. Isn't it marvelous, then, that a windmill has been made which will go 50 times as long as the best automobile with one oiling and keep it up for 25 or 30 years?

The **Auto-oiled Aermotor** after many years of service in every part of the world has proven its ability to run and give the most reliable service with one oiling a year. The double gears, and all moving parts, are entirely enclosed and flooded with oil. **Aermotors and Aermotor Towers withstand the storms.**

For full information write **AERMOTOR CO.** Chicago Kansas City Dallas Minneapolis Des Moines Oakland

Save $15.00 to $25.00 per Ton Grinding Your Own Feed With

"JAYBEE" Humdinger CRUSHER-GRINDER-PULVERIZER

The Old Reliable "Jay Bee" feed mill is the greatest money-maker you can buy. Mills have paid for selves in a single year. 3 sizes: 7 H. P. to 30 H. P. Fordson will operate successfully.

It Has Never Failed Me—Not a Dime for Repairs

Mr. S. Shipman, Guide Rock, Neb., says: "My Humdinger has never failed me. I have ground more than 15,000 bushels of corn and at least 400 tons of hay and fodder, and haven't spent a dime for repairs yet."

Over 7500 "Jay Bee" Mills in use.

Easy Payment Plan Feeding booklet, descriptive literature, FREE. Stock in principal cities.

Cool Grinding—Makes Better Feed. The "Jay Bee" does not heat the feed. Grinds any grain or roughage UNIFORMLY, finer, faster, at less cost per ton than any other mill.

Saved $150 a Month

Emil Westergard, Omaha, Neb., milking 47 cows, saved $150 a month on his feed mill. This saving paid for Humdinger, tractor, belt, pulley in one season.

Opinions, Brickbats, and Bouquet

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page but your editorial must not exceed 250 words. Hoard's Dairyman assumes no responsibility for opinions expressed.

Farmers Must Have Self-reliance

HOARD'S DAIRYMAN:—Having just finished reading your issue of September 25, I feel the urge to talk with our friend, Robert D. Kellogg of California on the subject of "Teaching Agricultural Self-reliance." I regret that I did not see the July issue to which he referred for possibly I may be saying the same things and making the same points as stated therein, but I am going to take that chance and set out a fact or two as I see them.

Education is of utmost importance in every man's life. I think that is a statement which no one may deny. There are various ways in which a man may be educated, but educated he must be if he is to entertain any hope of success. His education may be of a varied nature. He may get it all through experience, through reading, or in just his own natural ability to absorb conditions. We have many such men. He may secure it through a college course plus a few years of actual experience, but the degree of any man's success must depend upon his ability to be taught, or to secure for himself facts and the means whereby these facts may be made to produce a profit.

All this may appear theoretical, but I believe that it will stand the test. We are talking of agricultural self-reliance, and so let me ask, how are we farmers going to attain success unless we can rely upon ourselves to secure a way and a means to protect ourselves and our business from the unbalanced situation of today? It has always been a warning to me, I mean that I have often noticed what a failure any salesman was, any football player, any merchant, or farmer, who is always and forever finding fault with the other fellow and complaining of his unfairness.

If one is to succeed, it is necessary for him to study the case, learn why it is so and to discover the remedy. If he can successfully do this, he is educated on this phase, no matter through what channel he may secure his information. We farmers are so apt to put all our energy into hating Wall Street, railroads, industry, labor, and even our own sweet neighbor, that our real ability for success is lost. We are the laughing stock of the world, and our own government finds that it can do nothing for us, simply because we are so over-anxious to hurt the other fellow that we have no thought left to help ourselves. In such a condition, what help is there for us, as farmers?

Our nation, our states, our farm papers, all but our politicians, are trying to teach us "self-reliance" and until we are so educated what hope can there be? Let us stop berating the other fellow, look after our own affairs for ourselves, and then it will be impossible for anyone to deny us success.

Iowa. PAUL V. MATHER.

Children and Fords

HOARD'S DAIRYMAN:—I have a question to ask of the persons putting in these two kinds of ads. One class "No children." The object of marriage is home and children, not necessarily the baker's dozen, though the families having the most grown-up children have their family picture taken. I recently saw three groups of 18 children, or rather young men a women—a truly beautiful sight a fitted to adorn the front page of a paper or magazine.

The second class, "Must have he enough of his own." The first cla doesn't want any children; the seco wants them ready for work. Fro the time they are born until they a "help." What and where shall store these undesirables until th shall become desirable?

Is it the amount of milk these ch dren drink, as most cases allow on one quart and the average chi should drink that a day? If there a four or five more the milk must bought for them. The average wa of common farmer help does not low this. So it's a case of have children or own your own farm.

No wonder young couples put the babes on doorsteps and buy the For

I saw one ad in a farm paper as ing for married couple, no childr and no car allowed. Now what sh we do? But he did not say no Fo allowed.

Wisconsin. (MRS.) G. W. C.

Poor Old Iowa

HOARD'S DAIRYMAN:—For sev years now I have listened to the pol ical claptrap of farm relief from rious sources. In popular slang, I "fed up" on it. The mechanical mou pieces of would-be saviors from pea antry have been chanting "poor Iowa" so long that their owners ha failed to discover that Iowa farme already have made a new record.

Our neighbors are finding us o No less a person than Charles Goo rich, former governor of Indiana, h been visiting about lately in my st and while here he assembled a f figures from which he writes follows:

"Isn't it time that some loyal son Iowa was calling attention to the f that the per capita wealth of Io in 1926 was $3,539, nearly dou the average of the United Stat That the farm cash income l year was $718,000,000, an average $2,821 for each family. That only 8 per cent of this was from corn. Th her poultry products amounted double and her dairy products to ne ly four times the value of her co sold. That her farmers marketed 1926, 10,702,000 hogs, 1,899,000 cat 862,000 sheep, 289,000 calves a 32,000,000 poultry, to produce wh she fed 400,000,000 bushels of co at a net return of much over $1a bushel. That the value of the poul and dairy products alone for last y was $204,477,000. That her lo from federal banks have decrea from $98,636,000 on December 1920, to $6,794,000 on February 1927. That her loans from war nance corporation had decreased fr $24,000,000 on May 1, 1922, to o $22,000 on January 1, 1927. That deposit in her 1,427 banks and tr companies on December 31 last v $881,065,915.76, as against $442,1 916.96 on December 31, 1914."

Knoxville, Ia. W. S. I

Rufe Johnson's pet hound dis peared. Rufe put the following ad the paper:

Lost or run away, one liv colored bird dog called Jim. V show signs of hydrofobby in ab three days."

The dog came home the follow day.

,000 miles away, was a visitor.
James Patterson, secretary of the
heatland Plowing Match Associa-
n, has supplied the following notes
the contest this year:
"The weather was hot and perfect.
nts erected in the timber were cool
d shady. Plowing conditions were
favorable for good work as the soil
s very hard and dry. There were
enty contestants of which three
re ladies. In the classic plowing
ent Arthur Stark, a champion son
a champion father, and Walter
ickson displayed great skill in
awing back furrows on ridge and
rning and setting that hard, dry,
npy soil into nice, clean, even,
aight furrows of roundish comfor-
tion. A perfect back furrow would
t show any ridge and it required
se examination to tell which were
e back furrows.
"Fine exhibits of well matured
rn, good grain and vegetables fea-
red the grain show. All classes
re well filled. In the 4-H club
rk, six baby beeves and a strong
ss of gilts were judged by E. I.
chard, state club leader.
"A weed exhibit was put on by the
ate Department of Agriculture,
vision of Plant Industry, assisted
the State College of Agriculture.
e state was represented by Albert
ilson, seed analyst, and the college
Professor Peiper, botanist. Speci-
ens of snakeroot and other weeds
re exhibited and bulletins dis-
buted.
"In the pageant, plows of fifty
ars ago were contrasted with the
odern plow and the difference in
yles of dress were shown. One of
e floats carried the Boys of '77, or
en who participated in the match
years ago. The one hoss shay with
e whole family, Paw, Maw, Sue,
hn, Mary, Annie, Tim, and the little
ds, and a one lung auto and the
odern six-cylinder, and a 4-H club
at were also included in the
geant.
"About an acre was devoted to the
hibits of the auto show and farm
uipment. A chicken dinner was
rved free to the plowmen and
dges and at 50c a plate to others.
ost of the foodstuff was donated as
is chicken dinner is the main source
revenue to carry on the match.
ver 1,000 were served.
"In an eleven inning ball game
heatland defeated Seward 7—5.
vo aeroplanes were kept busy all
y, and many farmers viewed their
rms from a new angle.
"The Aurora Chamber of Com-
erce attended en masse and present-
the association with a souvenir
ogram and history of its organiza-
on. A fine spirit of fellowship pre-
iled."
The first Wheatland Plowing Match
as held September 22, 1877, with an
tendance of 250. Contestants were
nited to residents of the township
d much rivalry existed. The wis-
m of the founders was evident in
e rule that boys might compete for
premiums. These boys now are
e most successful farmers of the
ction. The committee reported re-
rding this first match, "We learned
nong other things that a furrow can
plowed straight; that there are
en who are masters of the plow;
at while we live we progress; that
lky plowing is a great step in ad-
nce of all hand plowing."
Twelve men attended the school
use meeting July 15, 1877, and
rmed the association which has so successfully conducted plowing matches for the last half century. Three of those most active in the movement were the elder James Patterson, Henry Mussey, and A. S. Thomas. Wheatland township, from which the match is named, was settled by many Scotchmen and Englishmen, whose hardy pioneer natures were well adapted to the building of fertile farms and establishing homes.

Only three times in 50 years have there been no annual matches—in 1884 when James Patterson, the president, was on an extended trip abroad; in 1893 during the Columbian Exposition at Chicago; and in 1918 during the World War. No match has been called off on account of weather conditions.

Everyone who attended the first match came in horse-drawn vehicles or on foot; never had heard of a telephone, an electric light, a radio, an aeroplane, a gasoline engine, a paved country road; had no delivery of mail to his home, no modern conveniences in his home, and knew little of what the rest of the world was doing. What marvelous changes have taken place in the half century!

Cyrus Stark was many times champion. His son was a champion at this year's match. Will Fairweather was six times declared champion plowman. Winners this year were Walter Erickson, driver for Buchholz Bros. in the manufacturers' and dealers' class; Arthur Stark in the local tractor class; Mrs. Henry Diehl in the ladies' plowing match; George Susemiehl in the boys under 21 class; and Irving Schrader plowing with horses won the class for boys under 17 years, horses or tractor. The contests were open to anyone in the United States.

The score card upon which the contestants were judged included: opening furrows, possible points 30; conformation of furrows, 25 points; straightness of furrows, 20 points; evenness of furrows, 15 points; neatness, 10 points.

NASH

Leads the World in Motor Car Value

New Price
Advanced Six
4-door Sedan
$1545
F.O.B. FACTORY

All Nash cars *now have*
Special Springs
of secret process alloy steel

The
Easiest Riding
you have ever enjoyed

This new riding EASE—a notable feature of the Advanced Six 4-Door Sedan—is exclusive to Nash by reason of springs built of special secret process alloy-steel.

These springs are engineered exactly to the weight and size of each Nash model. And shock-absorbers are provided, too.

So the road comfort of this car is absolutely amazing. *DRIVE* it and experience it yourself.

This is the *SPEEDIEST* car in the whole Nash line and the *FASTEST* car of its field in getaway. And its great, newly-perfected 7-bearing motor has *EXTRA POWER* for every emergency.

Another superiority is its steering for it's the easiest steering motor car on the market.

And silver-finished fittings, vanity case, smoking set, tufted genuine mohair upholstery, walnut steering wheel, walnut-finished door panelings, and window moldings; all evidence greater quality despite the *LOWER* price.

SPECIAL TERMS are now available on the car you own. Be sure to examine this Advanced Six 4-Door Sedan—the *leader* of the whole Nash line.

Closed Car Comfort

Your drivers, who have to pilot trucks a long way to market, will best appreciate the closed car comfort of the cabs on the new Speed Wagons.

For Reo, keeping Speed Wagons ahead of the crowd now as in the past, have not only improved Speed Wagons mechanically in many ways, have not been alone content to give the added safety of four-wheel brakes, but have also made Speed Wagon cabs as comfortable as most of the closed cars on the road today.

Drivers won't quit because of disagreeable driving weather when they handle these new models.

See the New Speed Wagons at your dealer today.

Wonderful New Method

Milks Cows Like No Other Machine Ever Milked Cows Before

Never!—No, Never!—have you seen anything just like it. Farmers clear across the continent are talking about the great Surge Milker and its wonderful new milking method. It is making records for breeders who never dared use a machine before. And they all say it is the easiest machine to clean they have ever seen.

Write today—NOW—for the NEW Surge Catalog telling all about this great wonder. This book is FREE. You need it. It contains a lot of information worth real money to you. Write for it—NOW.

Seasonable Live Stock Notes

THE husbandry of farm live stock, if properly conducted, is a profitable business; it conserves the fertility of land and makes a home market for the products thereof. The amount of money received for feed crops depends quite as much on one's skill with animals as on one's knowledge and practice in fields. Feedbox and field afford an all-year distribution of labor. Hoofs of animals may tread in wet and waste places where plows cannot go. Coarse, rough feeds are converted to the usefulness of man. Usually where good live stock is kept one finds progressive-minded people living in comfortable homes. Some things may need to be done in early November concerning the welfare of flocks and herds. Let us think about their doing now.

Kindness in the Cow Barn

It is a time of year when cows are made accustomed to their winter quarters; teaching them their proper places often requires patience and perseverance. Sometimes, too, we are not in a mood to be helpful to the seemingly slow understanding of cows that persist in poking their heads in the wrong stanchions. It always seems that the very evening we are in a hurry and perhaps have been put out about something during the afternoon the cows will walk all over the barn pretending to be looking for their proper stalls but in no hurry to find them. At such times we are persuaded to the use of harsh language and whatever happens to come handy for cracking cows' ribs. We can't tell one just exactly how to avoid or overcome such situations but we can highly recommend more patience and some kindness. Repetition creates habit. The habit of being kind in the cow barn is a good way to sell feed to cows for more money.

Keep Heifers Growing

When the heifers are brought into the barn this fall, before snow flies, they should be put on a good growing ration for the winter. A part of the secret of having a good cow at maturity is to start her growing the day she is dropped and never allow her to stop until she is a full aged cow. Continue feeding good quality legume hay; if silage is available 10 to 15 pounds per head may be fed daily. In addition to all the good roughage a growing heifer will clean up, she needs some grain. A good mixture may be made from 100 pounds each of ground corn, ground oats, or barley, and bran and 25 pounds of a high protein feed or mixed feed. Growing heifers will need from 2 to 4 quarts daily of such a mixture.

Winter Rations for Fall Pigs

Mixtures of home grown grains or those supplemented with cereal by-products are unsatisfactory as winter rations for fall pigs because they are deficient in essential vitamins, in high quality protein combinations, and in minerals. The result of feeding such rations through the winter will be restricted growth and lack of sufficient bone formation commonly termed rickets. Throughout the summer abundant sunshine and green feed, grass and legumes, supply the deficiencies of cereal grains. To correct these deficiencies in winter feeding skimmilk, alfalfa meal, and tankage are recommended. A good supplemental mixture may be made of 60 parts tankage, 15 parts linseed meal, 15 parts wheat middlings, and parts alfalfa meal. Skimmilk in li ited quantities of 3 to 5 pounds head daily makes a valuable addit to this supplemental mixture. Wh corn in the absence of these supp ments is inferior to yellow corn. N is the time to plan winter rations fall pigs.

Rations for the Milking Herd

In making winter rations for co in milk one should first consider wh roughages are to be fed. Silage a legume hay require a grain mixtu containing from 11 to 14 per cent gestible protein. We find that a m ture made of 6 parts of home gro grains, 1 part bran, and 1 part hi protein feed yields about 12 per c of digestible protein. We recomme two home grown grains and two hi protein feeds along with the br Thus 300 pounds ground corn, pounds ground oats, 100 pounds br and 50 pounds each of linseed a cottonseed meals make a mixture c taining 12 per cent of digestible p tein.

For good quality mixed hay and lage the mixture may be made of parts home grown grains, 1 p bran, and 2 parts high protein fe Thus 300 pounds ground oats, pounds ground barley (5 parts home grains), 100 pounds bran, a 100 pounds each linseed and cott seed meals (2 parts of high prot feeds) make a mixture yielding tween 15 and 16 per cent digesti protein.

For silage and timothy hay a gra mixture made of 4 parts home gro grains, 1 part bran, and 3 parts hi protein feeds yields between 18 a 19 per cent of digestible protein.

Legume hay without silage requi about 10 per cent digestible prot grain mixture; mixed hay requi the same as for silage and mixed h timothy hay alone requires about t same as for silage and timothy ha

It makes little difference what t home grown grains or what two hi protein feeds are used.

In the absence of home gro grains one should use mixed fe yielding the digestible protein in t percentages given for mixtures i the different roughages or combi tions. Mixed feeds of high prot content may be used where high p tein feeds are indicated.

Litter in the Poultry House

As the season advances we f quently fail to observe how dir worn, and compacted the litter b become in the poultry house. We st out with good intentions and with nice lot of clean straw but by t time snow flies we have a conditi in the poultry house unsuited to t best interest of the flock therein. L ter is placed in a poultry house which to hide scratch grain. The p pose of hiding is to make hens ex cise enough to keep in fit conditi A second purpose of litter is to c tribute to cleanliness. When litter worn out, dirty, and compacted it longer serves the purposes for whi it was intended. Little things count success with hens; clean litter a enough of it is one of the import little things to be looked after.

Specializes on Dairy Cows and Hogs

HOARD'S DAIRYMAN:—Keeping rec-ls on your farming operations ys, according to R. C. Johnson of unders County, Nebraska. There is en no guesswork and a perusal of e records enables one to discover e leaks in the business and profit by y mistakes. Enrolled in a cow test-g association and in a pig produc-n contest, both sponsored by the te college extension service, has al-made Mr. Johnson more interested dairying and in hog raising.

Last year the Johnson herd of 10 olsteins made an average production 400 lbs. fat. About half of the rd are pure-breds and the rest are ades. The butterfat test on the rd runs about 3.6 and 3.7%. Lo-ted close to the town of Mead, Mr. hnson finds a good market for his

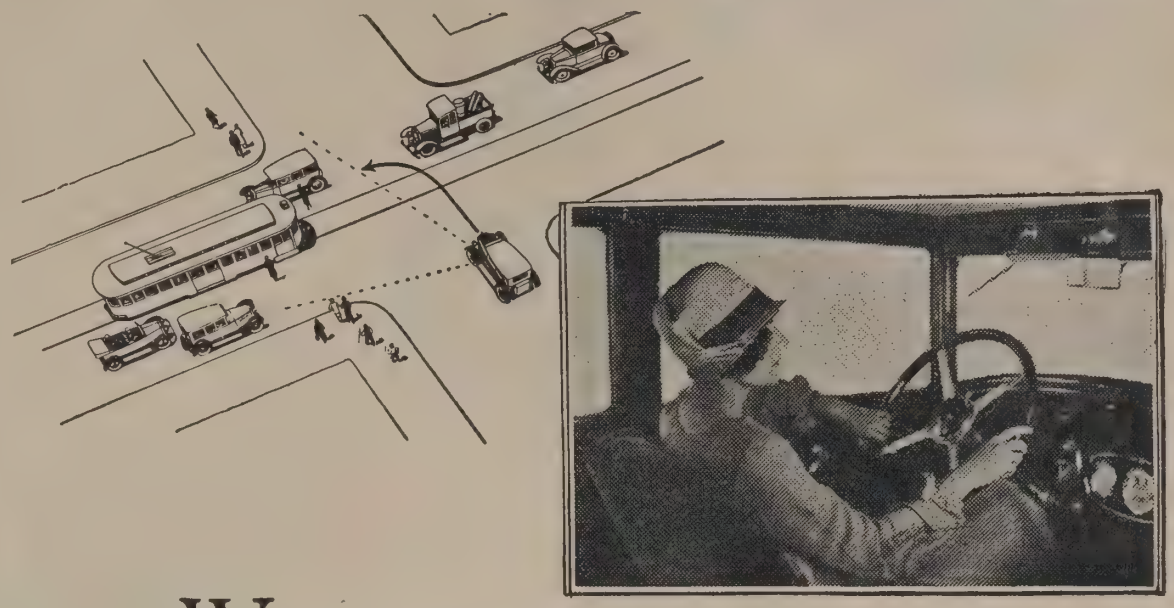
A ROW OF A-SHAPED INDIVIDUAL HOG HOUSES ON THE R. C. JOHNSON FARM

oduct to steady customers. About lf of the milk is separated and eet cream is sold. The rest of the lk is delivered in bottles to the wn trade.

Speaking of the value of a cow test-g association, Mr. Johnson says: uch an association enables a per-n to get yearly production records each cow in the most economical ay. I find in my own case that the cords are becoming more and more luable. My calves are in better de-and now than they were before. ne also learns of better methods of ndling and feeding cows through longing to an association. Being a ember of a cow testing association simply a business proposition."

The cows of the Johnson herd are a grain ration all the time. A lot oats are fed, mostly unground. orts are in the ration and some cot-nseed meal. The ration averages out 15% protein. One of the pure-ed Holsteins produced 615 lbs. fat, r milk testing 4%.

When the extension animal hus-ndry specialist, M. B. Posson, an-unced Nebraska's first pig produc-n contest, Mr. Johnson joined. In is contest, records are kept of the eight of all litters at the age of six onths. It means more than a ton ter contest, for the reason that all the litters are considered. When r. Johnson's records were all tabu-ted it was found that he produced 437 pounds pork per litter at the av-age age of six months. When sold ey made a very satisfactory profit ver the cost of production.



The ration for the pigs consisted of rn, tankage, oats, some skimmilk, d oatmeal. Two tons of oatmeal ere used in all and it was fed once a y as a thick mash. This oatmeal pt the pigs in excellent condition. very year for the past ten years Mr. hnson has hogged down corn. Rye especially well liked as a pasture op. It furnishes an excellent fall sture and in the first pasture crop ady in the spring. The rye is owed under about the first of May d the ground put into sweet corn r hogging down purposes.

Of course the McClean County sys-m of hog lot sanitation is carried ut on this farm and a battery of movable houses is a feature of the equipment.

Nebraska. H. H. BIGGAR.

Clear Vision in *Every* BODY *by* FISHER

CADILLAC • LASALLE • BUICK • OAKLAND • OLDSMOBILE • PONTIAC • CHEVROLET

WHEN you sit behind the steering wheel of a car with Body by Fisher, note how unobstructed is the view in front and to both sides.—Two features combined to create this greater safety and greater enjoyment in motoring.—One is the Fisher Vision and Ventilating Windshield, which affords vision through a single pane of plate glass, without metal or rubber strips to interfere with the clear view.—The other feature which makes Fisher-equipped cars safer and more pleasant to drive is the use of narrow front pillars of unusual strength, which eliminate the "blind spot" in driving.

The VV Windshield—This remarkable contribution of Fisher to greater motor car satisfaction not only assures perfect ventilation and complete weather protection—it is also safer and more convenient because it may be raised or lowered vertically with one hand while the car is in motion.

Plate Glass—Crystal plate—or thick window glass—is never used in Fisher Bodies. The diamond-like polish of the genuine plate glass used in every Body by Fisher affords perfect clarity of vision—another highly desirable safety feature of every Body by Fisher.

BODY by FISHER

Cheap Milk Transportation

The Atlantic & Pacific Tea Company has thousands of stores scattered through the country and they have gone into the condensed milk business to supply these stores. They have a big plant at West Bend, Wisconsin, but found that there was not enough milk locally to supply the demand. They plan to have condensing stations at other points where milk can be run through a condensing pan and reduced so that there will be only one-third the original volume. This milk is then put through in tank cars and moves under a very low rate. The tank car rates make it possible to move this milk three hundred miles at the rate of 11 cents per hundred for the original milk or about 33 cents per hundred for the concentrated.

Over fifty companies are now using tank cars, some of them renting as many as fifteen such cars. These are rented on a basis of $7.00 per day and hold sixty thousand pounds of condensed milk.

Tank cars and tank trucks have completely changed the transportation situation in regard to milk. It is easier to get milk in a hundred miles now than it was twenty-five miles a few years ago and it is nothing unusual to ship milk three or four hundred miles to market. We have had several letters from Chicago milk dealers asking us if we had any surplus and stating that it would be very easy to send milk from here to Chicago.

The eastern railroads are trying to avoid hauling milk in tank cars which compete with their much higher can price. These railroads have not given the low rate which now prevails on the western roads and hence very little milk or cream is going east in tank cars. It is almost certain that they will be unable to hold to this policy as some road is sure to give shippers the advantage of a fair rate and when this is done all other roads will be forced to follow. This will mean that the eastern market will be moved a thousand miles nearer to Minnesota. —Twin City Milk Producers' Bulletin.

The HINMAN Electric

A smoother, sweeter-running little machine you never saw!

Just a handful. Move it anywhere. Plug in, attach teat cups. How it milks! Listen closely or you can't tell it's working. One or two cows at a time. Just *watch* the hard work being done for you—time and money being saved.

Easiest to clean. Only 1/6 H.P. required. Low in first cost. Because it uses the *Simple Hinman System*—proved right by *19 years* of success in America, and in Belgium, France, England, Australia, South America and other foreign lands.

If you have electric power, choose a Hinman Electric and the future will confirm your judgment.

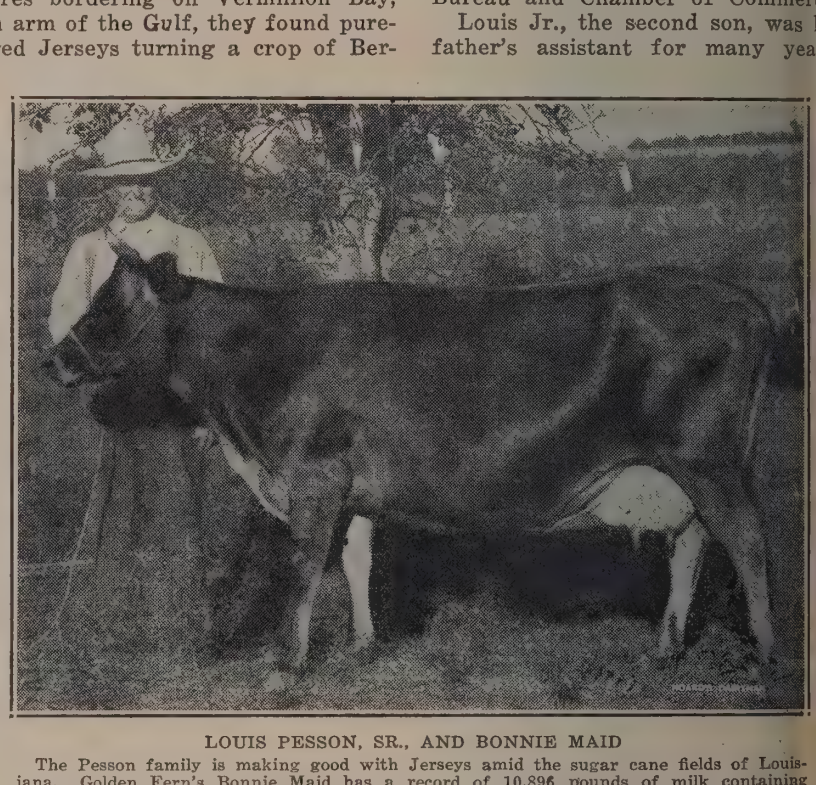
JERSEYS IN SUGAR CANE

J. L. FLETCHER, LOUISIANA

WHEN South Louisiana is mentioned, it is natural to think of fields of sugar cane, with great refineries turning out countless tons of sugar. Years of cane cropping, however, have about worn out a naturally fertile soil, and today with insect pests and diseases that crop is uncertain to say the least. There, as in all fertile sections when other crops have played out, the people have begun to turn to the dairy cow. Years ago a young farmer by the name of Louis Pesson found that the dairy business was more profitable in that country than the six months' task of growing sugar cane.

As time passed, Pesson's farm became a place of interest to the people of his section. They began going there to find why in hard times and seasons of crop failure, Pesson prospered while his neighbors went deeper and deeper in debt. There in pastures bordering on Vermillion Bay, an arm of the Gulf, they found purebred Jerseys turning a crop of Bermuda grass and white clover into milk and butter; fields in which a rotation of corn and soy beans, with the addition of many tons of manure, gave a larger tonnage of cane on half the acreage than did their own fields devoted exclusively to that crop. Today other dairy farms are appearing on the road to the Pesson place, and good cattle are replacing the ticky scrub of other days.



The sons of Louis Pesson, like their father, have followed the dairy business. The eldest, Robert, married when very young and went to work for his father at a monthly wage of thirty dollars. After five years he had saved sufficient to make a payment on a run-down farm in the neighborhood and to buy a few cows. He was a hard worker and believed that the only way to make a success of any business was to study it from every angle. He read all the material that he could find on dairying and began attending the Farmers' Short Course at the State University. There he learned the value of good bulls in building up a herd and the importance of keeping records. He found that a large part of his cows were not paying their way and these he replaced with good heifers that he raised. As his fields increased in fertility, he put in truck crops which he sold at good prices on the local market. Lately the extension depar ment of the state has been pushir the growing of Irish potatoes ar cabbage in this section for shipme to the northern market, and Pesso has made an outstanding success that line.

A few years ago Robert dispos of his original farm at a good pro and bought another at the edge of t neighboring city of New Iberia. his new location he is only a fe blocks from a good high school a it is his chief ambition to give h four children the advantages of education which he had to dig out f himself. Like his father, he has ways taken an interest in his co munity, and though yet a young m is counted one of the agricultur leaders of his state. This fact is tested to by his place as a direct in both the Louisiana Jersey Catt Club and the State Dairy Associatio as well as his active work in the Far Bureau and Chamber of Commer

Louis Jr., the second son, was h father's assistant for many yea giving especial attention to test a show cattle. In both these lines was very successful, as a state b terfat record and many prizes sh

Last year the Pessons decided t the time was ripe for them to expa into a community affair the butt making that they had long carried at their farm. They formed a co pany in which the father and t sons were stockholders, and began erating a creamery with Louis Jr. manager. Their business has creased constantly, until their pres output is something over 3,000 l of butter per week. They had pected trouble in securing suffici cream with which to operate, but seems that their dairy gospel l taken deeper root than they thoug It is now necessary for them to large their capacity in order to t care of the supply.

The Pessons are meeting m problems in this section that is n to dairying, but they are giving ca ful study to each one and indicati are that they will continue to be s cessful. Just now a large part their territory has been hard hit the flood, but they believe that best way for them to help th stricken neighbors is with a cre check. On this account they pushing the dairy business har than ever.

LOUIS PESSON, SR., AND BONNIE MAID

The Pesson family is making good with Jerseys amid the sugar cane fields of Louisiana. Golden Fern's Bonnie Maid has a record of 10,896 pounds of milk containing 676 pounds fat, which is a state record for her class.

Balanced Farming

The term "balanced farming" has en used promiscuously of late years those who would persuade the sin- cropper that there is less danger financial embarrassment in diver- ication. Few, however, have said ich about what is implied in the m.

Some time ago we were on a 96- e farm in Indiana where the best of "good farming" is being done t we have seen in many miles ough several states. This farmer a diversified program of produc- n but that is not the whole secret his success. The answer to his lity to live well, to provide labor ing equipment for his farm and ne, to pay $1,000 a year on his rtgage is found in "good farm- ."

He has found out how to find the profitable cows in his herd through mbership in a cow testing associa- n. That is a part of his diversifi- ion.

He has found out that breeding the t to the best is sound practice in mating of his breeding stock. The n of his herd sire produced 409 fat as a two-year-old, 646 lbs. fat a three-year-old, and 787 lbs. fat a four-year-old. That's a part of diversification.

He has found out how to get eight ers of pigs a year from four regis- ed sows and how to grow these s good enough for junior club mbers and other swine producers o will pay good prices for superior eding stock. That's a part of his ersification.

He has found out that filling the basket with 400 hustling White horn hens is a good way to sell d. That is a part of his diversi- tion.

He has found out what part of his m is best suited for growing pota- s and what fertilizer can be used fitably. Each year he grows five es of potatoes. He knows what to as spray, and when and how to it. He grows nearly as many po- oes on five acres as many do on acres. That is a part of his diver- ation.

He has found out that by tuning up land with lime, legumes, acid sphate, and manure, winter wheat igs a profitable cash return. Last r his wheat yielded 37 bushels acre. That is a part of his di- sification.

He has found out that he can get plendid stand of alfalfa following rop of early peas for the cannery. ast but not least he has found out t it pays to share interests and nership with his 19-year-old son. s son has been encouraged to try skill in many club projects and owns 7 pure-bred Jerseys. If thinks it has not paid he should and buy one of these. That is e of his diversification.

n the future when we think of nced farming, of diversification, the cow-sow-hen trio, let us go to root of balanced farming and im- good farming.

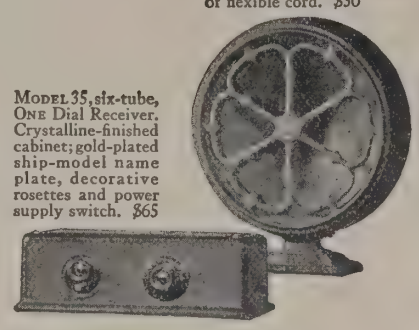
ATWATER KENT RADIO

A STRAIGHT answer to a farmer's straight question

"EVERY RADIO salesman," a farmer writes us, "claims his set is the best. I want the best, but cannot afford to make a mistake. I am inclined to buy an Atwater Kent on its reputation. Can you give me any facts to prove it is the best?"

To this friend and the many other rural families who are ready to invest in radio, let us say just this:

A test of any radio instrument, as of any farm or household implement, is *the way it works and the way it stands up under continued use.* So the method of manufacture is vitally important. Atwater Kent Receivers and Radio Speakers are constructed on the theory that the parts you can't see must be as good as the parts you can see. Every receiver has to pass 159 gauge and electrical tests before it leaves our factory. To this extreme care is due the comment you so often hear: "Atwater Kent Radio works—and keeps on working."



Tone is another test. Upon clear, natural tone depends the *reality* of the programs which radio brings into your homes. In the making of Atwater Kent instruments perfect tone quality is never sacrificed.

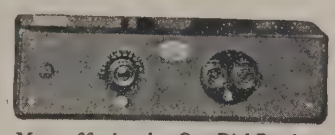
A third test is *simplicity.* Can you bring in the broadcasting stations without bother and delay? Atwater Kent ONE Dial operation lets you turn from station to station at will, selecting instantly the kind of program you like.

A fourth test is *beauty.* You are proud to show Atwater Kent Radio to your guests, as well as have them listen to it.

If you live far from broadcasting stations, *distance* is also a test. All Atwater Kent Receivers have a wide range—and there is one model specially designed for reaching distant stations.

Let the nearest Atwater Kent dealer show you that Atwater Kent Receivers and Radio Speakers meet *all* these requirements. Yet — because of large production — the price is low.

MODEL E RADIO SPEAKER. The result of nearly three years' laboratory work. With 9 feet of flexible cord. $30



MODEL 35, six-tube, ONE Dial Receiver. Crystalline-finished cabinet; gold-plated ship-model name plate, decorative rosettes and power supply switch. $65

"B" Power Unit. Automatic control from switch on receiving set.

Type R, for 60-cycle 110 to 115 volt Alternating Current, $50.

Type S, for 25-cycle 110 to 115 volt Alternating Current, $55.

MODEL 33, six-tube, ONE Dial Receiver with antenna adjustment device. Unusual range and selectivity. Solid mahogany cabinet; gold-plated name-plate, power supply switch and vernier knob. $90

MODEL H RADIO SPEAKER. Entirely of metal. Crystalline finished in two shades of brown. With 9 feet of flexible cord. $21

MODEL 30, six-tube, ONE Dial Receiver. Solid mahogany cabinet; gold-plated name plate, power supply switch and vernier knob. $80

ONE Dial Receivers Licensed under U. S. Pat. 1,014,002

A New Sweet Clover

A variety of sweet clover that will y green six weeks longer in the than varieties now in common , is reported by the United States partment of Agriculture. The va- y is one of several brought into country from Europe and East- Asia by scientists of the depart- nt.

An ideal clover, as far as useful- s is concerned, would be one that ld stay green late in the fall, then t growth early the next spring, remain green and in good feed- condition well into the following summer. The variety reported by the federal scientists approaches that ideal, they assert, more nearly than any now grown.

"All sweet clovers are variable in their habits of growth," the department's statement continues, "and many individual plants of distinct type and form may be found in nearly any sweet clover field. This offers an opportunity for the development of new strains of sweet clover for definite uses.

"There is considerable interest at present in the production of better hay varieties, since the common sweet clovers, especially the white-flowered species, are too coarse and heavy to make good hay from the second year's growth.

"Several good hay varieties have already been developed, notably the early flowering Grundy County, Crystal Dwarf, and Early Dwarf varieties of sweet clover, and the Albotrea and Switzer varieties of yellow sweet clover."

The talent of success is nothing more than doing well whatever you do without a thought of fame. If it comes at all it will come because it is deserved, not bcause it is sought after.—Longfellow.

Canada Ships Cream to London

The Canadian Pacific Railway's "Agricultural and Industrial Progress" notes the possible opening up of a new export trade for Quebec Province dairy producers in the reported successful trial shipment of three lots of ten 8-gallon cans of cream from Montreal to London, states Consul General Albert Halstead in a report made public by the Department of Commerce. This shipment is said to be the first one in which cream has been sent such a great distance for commercial purposes.

Nut-crack Night

"Wee Jenny to her granny says:
'Will ye go wi' me, granny?
I'll eat the apple at the glass
I got frae Uncle Johnny.'"

Jenny is a little Scotch maid celebrated in poetry by Robert Burns who longs to know who her future husband is to be. She believes the old story that if a girl stand and eats an apple before a mirror on Hallowe'en night her future husband will come and peep over her shoulder. But Jenny's superstitious little grandmother refuses to have anything to do with accompanying her because many a girl who has done this daring thing has got such a fright that she died from the experience.

This is only one of the many superstitions that center around Hallowe'en and practically all of them have to do with love-making and marriage. A quaint tale I read in an old book told of a happily married young English couple, parents of a baby girl. One night the mother went to bed with the child in her arms. In the night the baby awoke, first whimpering, then crying lustily. The mother lay as if in a deep sleep and resisted all efforts of her husband to arouse her. When she finally awoke after two hours she complained of feeling tired. "Alas," said her husband, "I see that I am not to live long and the man who is to be your second husband has been casting a spell over you." "Such, indeed, was the case as subsequent events showed but the lady lived long and happily with her second husband," concludes the old tale.

We smile now at such foolishness of superstition but there is no doubt that to many of our forefathers such events were very serious affairs. In the British Isles and probably other places it was believed until comparatively recent time that Hallowe'en night was the time when spirits of the dead could return to visit their homes and friends but it was believed that awful witches were abroad that night, too, so great fires were lighted on hilltops and men stood with lighted tufts of hay on pitchforks brandishing and swinging them about to ward off the witches.

Though we have long ago learned not to attach any importance to the old Hallowe'en superstitions, here are some of them that you can use as a basis for your Hallowe'en entertaining that will furnish fun for every one; the married ones will have as good a time watching the single ones take part as if they were in the games themselves.

Blindfold the people who are playing and take them to the garden where stalks of the summer crop are still in the ground. Let each pull up a stalk and return to the fireside. If the stalk is big or little, so will be the future husband or wife; the amount of dirt that clings indicates the amount of the dowery and the taste indicates the temper.

Another matrimonial game: Take three dishes, fill one with clean water, one with dirty water, and leave the third empty. Blindfold each contestant in turn and have him advance and put his finger into one of the dishes. If into the clean water, he is to marry a young girl; if into the dirty water, a widow; if into the empty dish, no one at all. This is a Scotch game called the Three Luggies and the famous "auld Uncle John," it is related, having dipped three times into the empty dish became so enraged that he seized the three luggies and with all his might "heaved them on the fire." In playing this game the positions of the dishes should be shifted after each trial.

Another Hallowe'en practice is to have each person peel an apple and throw the peeling, which has been kept unbroken, over the left shoulder. If fate is kind the peeling will form the initial of one's future wife or husband. Also it is believed that if unmarried persons walk downstairs backward looking into a mirror held in the hand, they will see the face of the future partner in life in the glass.

For good rollicking games that break the ice at a party there is nothing like bobbing for apples in a tub of water or trying to take out with the teeth a piece of money buried in a pan of flour, or trying to eat a doughnut suspended from a string without either breaking the doughnut or letting any of it fall.

One of the prettiest Hallowe'en sights I have ever seen was the children's lantern parade in a small village. They had taken pasteboard boxes of various shapes as large as a shoe box or larger and had cut out of them all sorts of fancy designs—faces, butterflies, buildings, animals, and so on—and had pasted over these holes tissue paper of various bright colors. On Hallowe'en night a procession of these little ones going along, each with a lighted lantern or candle in his box, makes a lovely sight and the lanterns make a pretty house decoration for a party afterward. It is necessary always to have someone watching for fire dangers, however, whenever hilarious fun gets mixed up with lighted candles.

I'll not even attempt to suggest Hallowe'en refreshments for it is one of the times of year when people defy Nature and put into their stomachs late at night all sorts of things that they should not—coffee, mince pie, pumpkin pie, doughnuts, cider and—I don't want to be a party to the indigestion that must follow.—LUCY THOMPSON.

Friendships in Good Repair

It was the famous Doctor Johnson, long experienced in the art of living, who gave this advice to a young man friend, "My son, keep your friendships in good repair." I know of few wiser commands, for friendship is one of the true and lasting consolations of life. Yet it is a thing easily lost and like any other precious possession we must give thought to keeping it.

Sooner or later we all learn that nothing in life is to be had for nothing. For the material things we usually give money; for the intangible things like friendship we give some personal quality—understanding, sympathy, loyalty, cheerfulness, or some other of the things for which people value their friends and we know that we cannot have the regard of people without earning it.

The story of the neighbors is old but it is worth keeping in mind. The Smiths moved into the neighborhood at the same time the Joneses did. After a few weeks Mrs. Smith was heard to say, "Oh, dear, we do have the poorest luck. No matter where we move we never get good neighbors. The last time we moved just on purpose to get rid of the neighbors we had but I was just afraid it would be as bad here, and sure enough it is."

But about that time brisk Mrs. Jones at Ladies' Aid was saying, "Oh, yes, we did hate to leave our other place, the neighbors were so good and kind; but as we said then, there are nice people everywhere and we're sure to find some wherever we go and already it has turned out that way here. Everyone is so nice to us and we already feel that our new neighbors are old friends." It probably was just a made-up story in the beginning, but isn't it true anyway? Some people seem never to have real friends any place they go, while others with no more money or position have friends everywhere.

One of the best ways to keep friendships in good repair, I believe, is to learn early to make allowances for people. Naturally no one is going to please us all the time any more than we ourselves are going to please them all the time, so on a day when Mary B. says sharply, "Well, I'd never let a child of mine do—" and then she names something that your child does regularly, just say to yourself, "Mary certainly has a sharp tongue but if I had to contend with all that she has and if I had the sort of inheritance she has, I'd probably be a good deal worse. Anyway, there isn't a better hearted soul alive nor a thing she wouldn't do for a friend and besides she really is bringing up her children as well as anyone I know." After that you'll feel in a considerably more charitable frame

(Continued on page 1011)

Embroidered Bedspread

"Oh, she has the loveliest home. Even the littlest things are just perfect—you should have seen her gorgeous embroidered bedspread.

How many times have you heard something like this? It is only the women who care that have nice things said about their homes, because all of the furnishings that elicit praise are the results of painstaking care.

Industrious and capable women can easily have such pretty things in their homes—furnished directions enable any woman to embroider the beautiful bedspread shown—a spread that "stands out" and adds a refined touch to the room it graces. Beautiful hand embroidery will quickly draw admiration. A complete combination is also available in this design at very attractive prices. Spread of heavy Krinkle Krepe, only $3.95. Curtains to match, $2.20. Scarf to match, 63 cents.

This complete outfit hand embroidered could not be bought in any store for less than forty dollars. In ordering give number, 812. Send to Embroidery Department, Hoard's Dairyman, Fort Atkinson, Wis.

"U. S." Blue Ribbon boots are made either red or black—with sturdy gray soles—knee to hip lengths.

It's a Brute *for* Wear!

—this "U.S." Blue Ribbon Boot

SLIP on a pair—get them into action—see the stuff that's in them—and you'll understand why we say this "U.S." Blue Ribbon boot is a brute for wear!

Look at that thick, over-sized sole—made from a single piece of the toughest rubber.

Rubber so live and elastic it will stretch five times its length! That's what you get in the uppers. It resists cracking and breaking—stays pliable and waterproof.

Five times its length it stretches! That's what a strip of rubber cut from any "U. S." Blue Ribbon boot or overshoe will do. This rubber resists cracking and breaking—stays flexible and waterproof.

These boots have rugged strength—and lots of it. From 4 to 11 separate layers of rubber and fabric go into every pair!

When you get "U. S." Blue Ribbon boots or overshoes you'll find they've got long wear built all through them! And they are as flexible and as comfortable as you could wish.

The "U. S." Blue Ribbon line is the result of 75 years' experience in making waterproof footwear. Every pair is built by master workmen *—and shows it!*

Buy a pair. *It will pay you.*

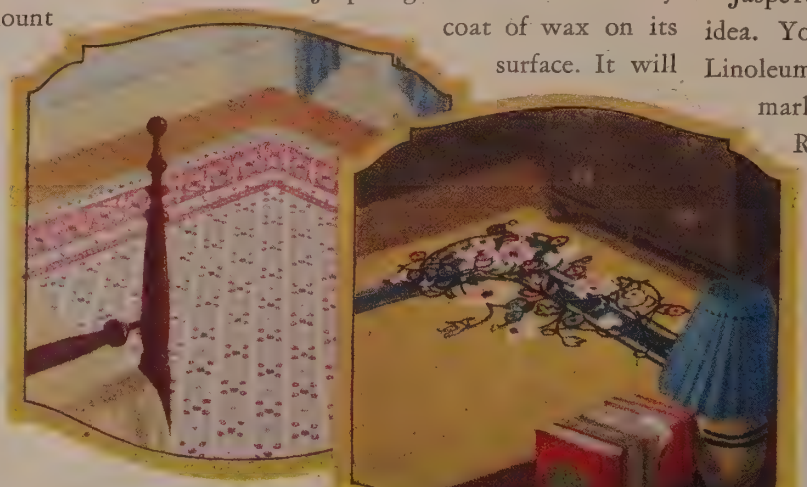
Genuine Cork Linoleum Rugs in NEW–DIFFERENT–PRETTIER Patterns

ITS pretty patterned surface is as smooth as varnished woodwork. Dirt just simply won't grind in. Grease spots come off as easily as from a smooth china dish. As a covering for that old kitchen floor, it means an end to scrubbing.



Think of having a rug for the kitchen so pretty and colorful, (the pattern illustrated is from an old Japanese design) yet so easy to clean and *keep clean*. It will stand an amazing amount of wear, too, because it is made of genuine linoleum. Given an occasional coat of clear varnish, it will last year after year even on the most "walked-on" floor in the house.

Just a light mopping makes this lovely rug gleam like new

New Jaspé Rugs

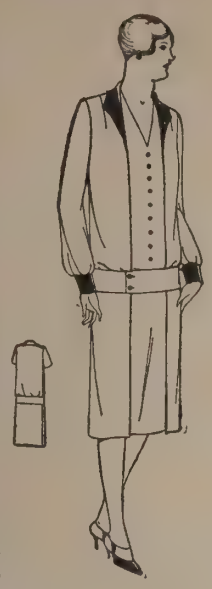
For the other rooms, there are the beautiful new Jaspé rugs with the wax finish. If you have not seen this new type of smooth-surface rug, by all means ask for them in the stores. These are made of the very same Jaspé linoleum that has become so popular in Armstrong's Linoleum Floors. The Jaspé graining is solid, right through to the burlap back—it can't wear off.

Each of these Jaspé rugs comes with a velvety coat of wax on its surface. It will keep its original lustre and freshness indefinitely, if waxed as needed, and polished from time to time with a soft cloth.

In the large illustration: *Pattern No. 816.* Above: *Inlaid Pattern No. 1031.* Right: *Jaspé Rug No. 707.*

Jaspé rugs are distinctly an original Armstrong idea. You will find each genuine Armstrong's Linoleum Rug identified by the Circle A trade-mark stamped on the gray burlap back. Remember to ask the store clerk for "Armstrong's" by name.

Book of Rug Patterns, Free



"Rugs of Practical Beauty" is a booklet illustrating the new Armstrong Rug patterns in their original colors. You may have a copy simply by writing to Armstrong Cork Company, Linoleum Division, 1020 Jackson Street, Lancaster, Pennsylvania.

nind toward her and toward your- than you would had you made e sharp retort.

When you are tempted to say a ting thing, think ahead a little. pose you were smart enough to k up the very thing that would t most deeply. Would you feel better or would the other per- ? Would anything come of it but eeling of bitterness on both sides finally a permanent estrangert? Some people think it is a sign weakness and cowardice not to ke back, and with a few it is; but h the real people it is the strong, ve thing to do.

Friendship is a term that applies t as well inside the family as outi, for it is derived from a good old glo-Saxon word meaning love, to which our use has added respect and esteem. I think it is the Chinese, that nation known everywhere for its politeness to guests, that have the old proverb, "Always treat your wife as politely as you would your guest." The proverb could apply just as well to the rest of the family. The consideration we force from people by demanding it is worth nothing; what we earn by being worthy of it is priceless.—LUCY THOMPSON.

Time for Bulbs Again

It was a great blow last fall to go bulb buying and find that all the kinds I most wanted were just twice as high as they had been the year before. That was because some foreign blight prevented the importation into this country of many varieties, naturally raising the price.

I don't know how it is going to be this fall but I do know that even at a somewhat higher price it is worth while to have a few bulbs. To find on a gray winter day that the bulbs are budding is almost as exciting as to discover that the baby has a new tooth and the blossoms do add so much to a house on a gloomy day.

Bulbs may be grown in either soil or water. If you use soil, place some cinders or broken pieces of old pots beneath the soil to provide drainage; then fill in dirt, placing the bulbs well below the top of the pot and filling in around them. Water and set away in the cellar or other dark, cool place. Too much water causes the bulbs to rot so be careful to use it sparingly while the bulbs are in the dark.

Prof. J. G. Moore of the University of Wisconsin gives the following advice on bulb-raising:

"Hyacinth bulbs are usually grown with more than one bulb to a pot and may be planted just below the soil surface or one-half to one-third above it. Easter lilies require a rather rich soil which should just cover the bulb top. Tulip bulbs should be planted deep in the soil and the outer red covering should be removed before planting.

"The water method may be used to grow all bulbs except the Easter lily and the tulip. To prepare a dish to hold bulbs grown in water, gravel, charcoal, and pebbles are generally used. The bottom of the dish is filled with gravel mixed with powdered charcoal or with gravel and cinders. The remainder of the space in the bowl is filled with pebbles to hold the bulbs in place.

"Too much water on the bulbs will cause them to rot and until the roots have started to develop the base of the bulbs should just touch the water.

"Newly-planted bulbs, whether in soil or water, should be kept in a cool, dark place until a good root system has developed. Root systems of bulbs grown in soil may be investigated by inverting the pot on the hand and removing the contents. The length of time it takes for good roots to develop varies from six to ten weeks for soil bulbs but for bulbs grown in water the time is considerably less."
—LUCY THOMPSON.

Cheese Torte Without Crust

To 1½ lbs. of cottage cheese which has been put through a fine sieve, add yolks of 8 eggs, 3 tablespoons sifted flour, 1½ cups granulated sugar, 1½ cups rich cream, pinch salt, rinds and juice of one lemon and to the above stir 1½ large tablespoons butter, after it has been well creamed. Lastly add beaten whites. Bake in large baking pan which has been well buttered and dusted thoroughly with grated bread crumbs. Bake for ¾ hour.—Household Nutrition.

Butter Color Depends on YOU

Don't blame the feed or the condition of your stock if market men grade you low and customers complain on account of the color of your butter. You can keep your butter always that golden June color which brings top prices by using Dandelion Butter Color. It's purely vegetable and meets all State and National Pure Food Laws–used by all large creameries for years. It's harmless, tasteless and doesn't color buttermilk. Large bottles, 35c at all drug and grocery stores.

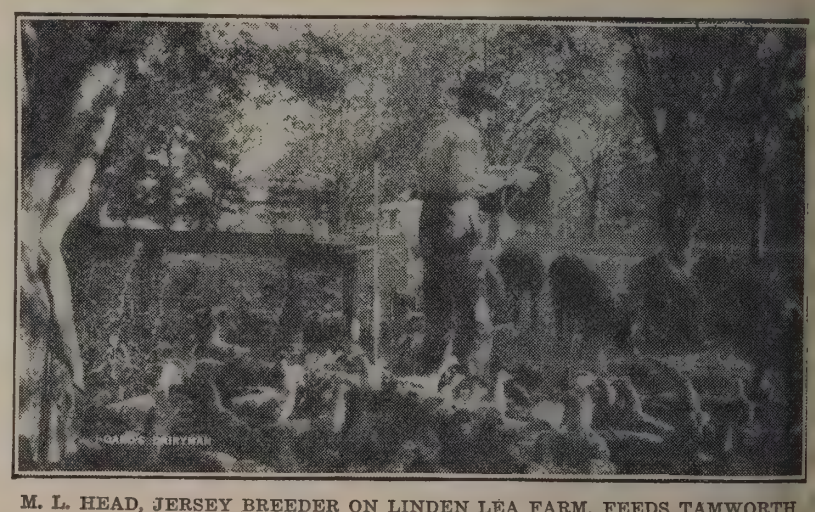
Minnesota's Oldest Cow Testing Association

(Continued from page 988)

coat of barnyard manure once in five years, he thinks the time is not far distant when he will have to use some fertilizers, especially phosphates, even on his well-improved farm where the small grain usually yields 60 bushels per acre. He now has 11 acres of alfalfa but expects to increase his acreage to 20 as soon as he can get the ground ready. The first crop from this patch this year was 24 good loads. The alfalfa idea, too, was one that came with the testing association program and the spread of this crop in the community is responsible for many of the good herd averages that one finds there.

Nelson Favors Shorthorns

E. A. Nelson has placed his faith in Milking Shorthorns to pay the rent on the Oak Park Farm that he operates on a cash lease basis. In the last 14 years his herd of around 20 cows has ranged in production from an average of 228 pounds per cow to 402 pounds but it has never dropped below 300 pounds since 1920. He is especially fortunate in having had Buttercup 2nd in his herd for she produced an average of 657.7 pounds fat on his farm and made a state record after he sold her. As a result he has been able to dispose of all the good bulls of his own raising and many others that are of his breeding that his neighbors have asked him to sell for them.



Mr. Nelson markets his whole milk at a premium of 50 cents a hundred above the butterfat price and takes home 400 pounds of buttermilk each day, for which he pays 13 cents a hundred. He feeds this to his 54 pure-bred Tamworth pigs that he is getting ready for an early market, and for which he will be paid a premium of 50 cents a hundred. He says the packers are paying 25 cents premium on first cross Tamworth and 50 cents on pure-breds. He has never had any trouble with the pigs as 6 sows raised him 54 this year. The pigs were all born the first week in March, but the largest of them already weighed 180 pounds on the 15th of July.

Retired Doctor Raises Jerseys

Linden Lea is the farm name that Dr. M. L. Head gave to his beautiful 135-acre farm when he gave up the work of a country doctor to specialize in raising a Sophie 19th of Hood Farm strain of Jerseys. For the past 11 years some one of his five sons and four daughters has been in attendance at the Minnesota College of Agriculture. The cream and milk checks from the Jerseys, together with the egg and poultry checks from the flock of 700 pure-bred Plymouth Rocks, have furnished the funds to make this possible. The boys have not left him, however, because four of them are still on the farm, so the Heads make quick w of the evening chores when the of them sit down to milk the thi cows.

Dr. Head is more interested in l time production records made un ordinary farm conditions than he in forced tests as often made in cial work, so he prefers to have herd in the cow testing associat to official testing. One year the h averaged 373 pounds fat when mos the cows were mature animals, last year when ten of them were t year-olds the average for all the c in the barn was 325 pounds. I May seven heifers ranging in from 20 to 28 months averaged pounds fat with the test on some them running as high as 6.8 per c

The owner of Linden Lea is shipping his cream to St. Paul t special market. He is trying ou new type of gasoline heater that g erates steam in less than two minu making it possible for him to steri his milk utensils with a minimum time and expense to insure a qua product. The boys wash the da equipment to lessen the housek tasks of their mother. The He have been working on daylight s ing time ever since the war, so

M. L. HEAD, JERSEY BREEDER ON LINDEN LEA FARM, FEEDS TAMWORTH PIGS AND PLYMOUTH ROCK CHICKENS, TOO

clock in the kitchen is an hour ah of time in the summer, but the b like it that way.

Stiehl Likes Guernseys

The beautiful home on Maple W farm was built and paid for in 1 with cream checks from Vic Stiehl's herd of grade and pure-b Guernseys. Stiehl was the pion Guernsey breeder in the district his first pure-bred was one of the f that came to Freeborn County. has always kept records on his c since he bought the 197-acre farm 1903. Until McMurray came to do work he did it himself with a fo bottle tester of his own, but he s that it is too much work for a far if he can get a tester to do it. started out with a scrub Shorth herd that averaged only 149 pou fat per cow. Through the use the grand old bull, Prince Oak La this average was raised to 394 pou in 1915. This bull was the best Stiehl has ever owned, as later b have not kept the production so hi although the yearly average has ne dropped below 300 pounds per c This bull was first sold to the Ma at Rochester but he was later p chased by the University of Minne to head the herd at Morris. Thi only one of the many good sires in association that was saved from block by Mr. McMurray's Babc tester.

The matriarch of Stiehl's herd an old cow named Imported Hutt

y of the Village Third. Though has never been milked more than e a day, she has an eleven-year age of 389.4 pounds fat per year, total production of 4,283 pounds er lifetime and she is still produc- well.

Feed Only Home Grown Feeds

t Brothers, graduates of the three- course at the farm school, have hed the herd records on the Wild- l Farm Guernseys each month as ck" has driven into their beauti- farmstead to make the tests. rt directs the farm work and s to the hogs, while Cyrus runs the ing machine and cares for the 24 . They have 108 Poland China this spring. The egg checks from laying flock of 350 White Leg- s averaged more than $100 a th last year, because each hen did best to bring the flock average to eggs per hen. They are satisfied the co-operative egg and poultry ciation is handling their product ie most efficient manner.

ie only purchased feed that comes their farm is salt, limestone, bone meal, but their herd always ages well over 300 pounds per cow they realized more than $100 prof- ove feed cost one year with an- r for every animal milked. They their cows all the alfalfa hay and e they will eat and a grain ration e up of two parts ground oats barley succotash and one part nd corn. Some field peas are fed ddition. Succotash sown at the of one bushel of barley to two els of oats has give them an aver- yield of 65 bushels per acre for y years and they think it makes a feed.

bout once in two years the Otts a surplus stock sale when they e the public to visit their farm. y have found the cow testing rec- invaluable not only in their feed- but in the making out of sales logs, because buyers prefer cows records to untested animals. ry cow in the barn is tested be- e the boys want the records for r own use and not for the publici- ey bring. Their herd bull, Crown ice of Echo Bay Farm, was rded grand championship honors he 1925 county fair, but Cyrus ks a son of his will defeat him year.

s is the case in Wisconsin, the bination of cows, hogs, and poul- is one that makes for profit. All of these pioneers have adopted triumvirate as the basis for their cultural activities. The cow is ishing by-products that make the and the hen more valuable. So H. V. McMurray's testing outfit cting the boarder cows, this com- nity prospers.

erhaps it would be well to close article with a tribute to the one- ed man from Ohio who has done his bit, in spite of ill-health, to make dairying pay. In the words of one who knows him best, "Mack has done more than any other living man for the dairy interests of Freeborn County."

American Students on an English Dairy Farm

HOARD'S DAIRYMAN:—It is a far cry from Wisconsin, one of the great agricultural states of the Middle West, to a Middlesex Farm. Nor does the usual touring party of Americans extend its interests beyond the great centres of historical interest in this country. But a party of twenty or so girl students from Wisconsin University, some of them intimately interested in farming in their own state, expressed a wish to their leader to see an English farm. Mr. Robert Fulton, of the Rectory Farm, Enfield, gave the party ample opportunity to inspect his farm, where they were entertained to tea by Mrs. Fulton and Mrs. Charles Sisson of University College, London.

The students were especially interested in dairy farming, and were the more interested therefore in this farm. They were particularly struck by the orderliness and neatness of the steading and the cleanliness of the herd, which their larger organizations can rarely rival, and found a parallel here with industry in general in America as compared with England, the latter aiming at perfection in a smaller output. They wondered whether agricultural science in England rendered the same practical service to the industry, either in methods of farming or on the business side of the industry. They remarked on the absence of silos, an essential part of the organization of an American farm. Finally, they expressed their love for the English countryside and their pleasure in seeing at first hand a highly organized modern English dairy farm in all its aspects.

England. R. FULTON.

City Milk Prices in Ontario

HOARD'S DAIRYMAN:—For the eight months, Sept. 1st, 1927, to May 1st, 1928, unless unforeseen conditions warrant a change, the price of milk, delivered at the dairies in Toronto and Hamilton, Ont., will be $2.20 per eight-gallon can or $2.66 per cwt. This is an advance of 25 cents a can or 30 cents a cwt. over prices ruling for the four summer months of 1927, beginning May 1st. The price of sweet or commercial cream for the winter months will be 58 cents per pound of butterfat.

Carrying charges for delivering milk in Toronto, which the producer has to pay, are 25 cents per eight gallon can or 30 cents per cwt. Where milk is shipped in by train, city distributors charge 10 cents per cwt. for cartage to the dairies and returning the empty cans. The bulk of the milk is, however, shipped in by truck at the transportation charges given above.

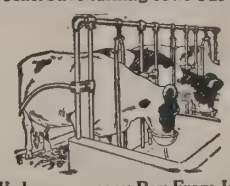
At the above price for winter milk city distributors sell milk retail at 15 pint tickets for $1.00 as compared with 16 pint tickets during the summer season. It should be explained here that the Imperial gallon is the standard of measurement in Canada, a gallon of milk weighing 10 lbs. and a quart 2½ lbs.

Canada. J. W. WHEATON.

"The certified milk industry," recently said President Pearson of the University of Maryland, "is of great use to the dairy industry because of the high standards and splendid example that it sets. No one will deny that the average quality of all milk has been greatly improved by reason of the work that has been and is being done by the producers of certified milk."

No More Wheelbarrow Drudgery for Me!

You too can ease up the hardest job of the barn—take the drudgery out of it—and save time. *Send the coupon below* for full information on the Louden Manure Carrier.



Used 365 days every year. John Rissler, Durand, Wis., says: "I wouldn't trade mine for a good grain binder if I couldn't get another. My 11-year-old boy easily cleans the barn every morning". P. Winkelman, Granville, N. D., says: "It makes the care of cows and horses a pleasure instead of drudgery". Hundreds of letters like these.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Quality Club Show at Waterloo

QUALITY there was in the sixth annual junior department at the 1927 Dairy Cattle Congress at Waterloo, Iowa. There were quality club members—exhibitors, demonstrators, leaders, junior judges—quality club calves, and a quality program. When it rains every day for a week so that you have to slosh around in the mud and then maybe on the last day, to cap the climax, the judge puts you at the wrong end of the line and you can still wear a smile, that shows that you are made from quality stuff, and you are a champion even though you don't get the purple. That's the 4-H club spirit you see at Waterloo.

Monday, September 26th, was judging day. Some 37 teams made up of 109 boys and two girls competed for honors. Beautiful silver trophies were the awards for the championship club team and the winning vocational high school team. During most of the day, the contestants were busy placing classes of cows and giving reasons. It was a day to test the metal and ability of the best.

Iowa has established a reputation for dairy cattle judging teams. Teams from the Iowa State College at Ames have ranked near or at the top in college judging contests at Waterloo and at the National Dairy Show several times in recent years. It is notable that the Iowa State College judging team, which ranked first in the college judging contest at Waterloo this year, was made up of former 4-H club members.

Club teams from Iowa have won first at the National Dairy Show twice in the last four years and have each time creditably represented the United States at the International Junior Dairy Cattle Judging Contest held annually in England. Franklin County won the championship cup this year and with it the right to represent Iowa at the National Dairy Show at Memphis where teams from 26 states will compete on October 17. It was a team from Franklin County that won the national contest in 1924 and brought back the gold cup from England for the United States.

Both of these Franklin County teams have been coached by the county agent, V. B. Hamilton. Members of this year's team are Ralph Thompson, Robert Mallory, A. J. Marken, with J. S. Van Wert, alternate. Fayette County placed second and Webster County, third.

Erwin Oldfather of Fayette County was the high individual judge of all breeds. Ralph Thompson of Franklin County and Robert Ward of Webster County tied for second place. The medal for second place became the property of Robert Ward on the toss-up. Robert Mallory of Franklin County placed fourth and Rex Pieplow, Fayette County, fifth.

Medals for high individuals in the several breeds were given by the breed associations. Winners were as follows: Jerseys, Aaron Tiedon and John Simmons tied for first; Holsteins, Berniece Kaiser of Clayton County; Brown Swiss, Robert Ward, Webster County; Guernseys, Harley Hanson, Butler County; Ayrshires, Erwin Oldfather, Fayette County.

One out-of-state team competed in the interstate contest. Iowa placed first with Minnesota second. The high individuals in this contest were 1, Ralph Thompson, Iowa; 2, John Flynn, Minnesota; and 3, Robert Mallory, Iowa.

Twenty-two teams took part in the vocational judging contest which was won by Hudson with Dunkerton 2nd and Tipton 3rd. A. J. Evans coached the Hudson team which was composed of Marion Minish, Richard Pearson, and Myron Minish.

Some good dairy demonstrations were given by the seven teams who competed for the state championship the latter part of the week and the opportunity to represent Iowa at the National Dairy Show. Here again Iowa has excelled, having won the national championship the past two years. Clean milk production, control of lice and mange on dairy cattle, and dehorning young and old dairy cattle were the subjects demonstrated. John S. Quist, assistant state club leader, was in charge of the contest which was judged by Paul C. Taff, Iowa state club leader, and R. A. Turner of the U. S. Department of Agriculture.

Butler County, demonstrating dehorning, won the contest. Adair County was second, Humboldt third, Hancock fourth, and Black Hawk fifth. Vernon Scheuman and Claire Chapman were the members of the Butler team which was coached by County Agent John Mullins.

One of the big events of the week was the 4-H club banquet held Friday night in the beautiful dining hall of the Elks' Club at Waterloo. About 150 boys and girls enjoyed the music and entertainment, the meal, and the program. Fred Ferguson, formerly secretary of the Iowa State Dairy Association and now on the staff of Iowa State College, presided as toastmaster. In his remarks he commented on the splendid growth and development of the junior department at Waterloo since its inauguration in 1922, five years ago, when there were only 15 boys in the judging contest, 47 calves exhibited from two breeds, and no demonstration teams.

G. L. Noble, secretary of the National Committee on Boys' and Girls' Club Work, announced that Kermit Iverson was the winner of the Blue Valley Creamery trip to the National Dairy Show presented to the champion dairy calf club member of Iowa.

Earl J. Cooper, director of extension for the Holstein-Friesian Association of America, led singing and R. A. Turner, U. S. Department of Agriculture, C. B. Finley of the American Guernsey Cattle Club, "Gunboat" Smith of the Iowa Jersey Breeders' Association, and J. Allen Wallis, president of the Iowa State Dairy Association, were introduced to the juniors.

Floyd Johnston, secretary of the Iowa State Dairy Association, presented the awards for the junior dairy cattle judging contest. The breed associations of Iowa gave the banquet to the boys and girls.

While the calf club show has been larger, more counties were represented in the junior department at Waterloo this year than at any time in the past. Calf club entries came from 20 counties. You were impressed with the large classes of heifers in milk which shows you that club members are developing good cows from their calves.

There were 178 calves shown of which there were 93 Holsteins, 39 Guernseys, 29 Jerseys, 8 Brown Swiss, and 7 Ayrshires. H. R. Searles and O. G. Schaefer, both of the University of Minnesota, were the calf club judges. Earl J. Cooper assisted them in placing the Holsteins and Frank Asteroth, field representative of the American Jersey Cattle Club, placed the Jerseys. C. B. Finley placed the Guernseys.

Herbert Kaiser, who has been prominent in the dairy calf club department at Waterloo for several years, won the junior showmanship contest and with it the handsome silver trophy offered by the Iowa State Dairy Association. Herbert was also the champion Guernsey showman. Other champions were Donald Hamer, Holstein and reserve champion over all breeds; Fred Thompson, Jersey; Walter De Winter, Brown Swiss; and win Fratzky, Ayrshire.

Floyd Johnston of the Iowa S Dairy Association should get cr for the success of the dairy calf department at the Waterloo D Cattle Congress.

A club camp was maintained on grounds by the Waterloo Y. M. C

Individual placings in the calf department were as follows:

FRANKLIN COUNTY'S WINNING JUDGING TEAM

Our Review Column

regular feature of the junior department, ring the contents of Hoard's Dairyman e previous issue. Let's talk it over.]

r further discussion of the fol- g see the Oct. 10th issue.

w can idle acres be put to work? made idle by fence rows can be ned by fencing larger fields. Wet on the fields can be drained. roadside can add acres to every if it is used as pasture or grows y crop. (See page 925.)

w much milk was produced in J. S. in 1926? Over 60 million or 330 gallons at every tick of clock during the 24 hours of day in the year. (See page

w much milk is produced by the ge cow? Last year fewer cows ced more milk. The average ction per cow was 1,000 lbs. er than it was ten years ago.

at is happening to the consump- of dairy products? It is going The per capita consumption of milk in 1926 was 55.3 gallons very man, woman, and child in nited States.

which month is the most milk for dairy manufacture? More r, cheese, and condensed milk roduced in the month of June in any other month of the year. month accounts for one-eighth l milk used for manufacturing ses.

at is the cause, cure, and pre- on of depraved appetite? The toms of this peculiar disease are: show a desire to chew bones naw wood, chew leather and eat animals fall off in weight, milk tain the heat and controlled by an automatic thermostat seems to be best adapted to farm conditions. (See page 932.)

Which state turns the most milk into manufactured products? Wisconsin stands first with 19 per cent of the total milk going into manufactured products; Minnesota is second with 14 per cent, followed by Iowa with 9 per cent. Minnesota leads in the manufacture of creamery butter, Iowa second, Wisconsin third. Wisconsin leads in factory cheese, condensed and evaporated milk. Pennsylvania is first in the production of ice cream. (See page 946.)

How should mangels be fed? To safeguard against scours, the freshly dug mangels should be stored several weeks before feeding. Mangels should preferably be fed immediately after milking. (See page 967.)

How can a simple mineral mixture be made for hogs? Hard wood ashes, 60 lbs.; bone charcoal, 25 lbs.; common salt, 15 lbs.; potassium iodide, one-fiftieth of one pound. (See page 974.)

Junior Letters

Our Country

Hoard's Dairyman Juniors:—I have written a poem, "Our Country." I had a little help from my teacher. I am 11 years old.

Our country!—'tis a glorious land,
With broad arms stretched from shore to shore;
The proud Pacific chafes her strand,
She hears the dark Atlantic roar;
And nurtured on her ample breast
How many a goodly prospect lies,
In Nature's wildest grandeur dressed
Enameled with her loveliest dyes!

Great God, we thank Thee for this home,
This bounteous birthright of the free,
Where wanderer from afar may come
And breathe the air of liberty!
Still may her flowers untrampled spring,
Her harvests wave, her cities rise;
And yet, 'til time shall fold her wing,
Remain earth's loveliest paradise!
My address is Loyal, Wis. Julia Klug.

From Club Member to Leader

Hoard's Dairyman Juniors:—It has been a long time since you last heard from me, so I'll have to introduce myself.

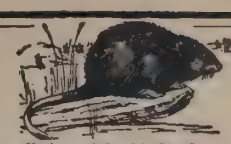
My sister and I were members of the "We Can Can Club" last year. My sister and I had ten of the prize jars. I won only one distinction in canning club; that was "None of my canned products spoiled," which none of the other members could say, for if nothing else happened there was a tiny speck of mold or something on a jar which otherwise looked perfect.

My sister and I were also members of a second year sewing club. We won our share of prizes at the county fair and our demonstration team won first. "Approved Shoes for the School Girl" was their topic. At the state fair they placed second and so did our judging team. My sister ranked third; her teammate in demonstration, seventh; and I, the other member, thirteenth. That sounds bad for me, especially since at our county fair I won every blue ribbon offered in the sewing division. Our style show contestant won first at the state fair and twelfth at the National Club Congress. I thought that splendid for a girl 12 years old.

This year I have to be content with being an associate member for I, like everyone else, pass the age limits. I am assistant leader and associate member of our third year sewing club, associate member of our "Keep Fit" Club, and papa and I have the leadership of a pig club. He does most of the work but I have charge at the meetings and do the correspondence part, so he is the leader and I am his assistant. Most of our members are just beginners so that is the place we have the most chance for development.

I graduated from high school a year ago.
My address is R. 1, Trumbull, Nebraska.
Cathern Furry.

My Favorite



Hoard's Dairyman Juniors:—I am sending a poem. The cow which I have reference to is a well bred Ayrshire weighing about 900 lbs. and is giving an average of about 1,100 lbs. milk per month. She is a good cow and is very quiet in the stable.

My favorite cow is the Ayrshire,
So handsome and well bred,
She gives as much milk and cream
As any other cow, well fed.

You may talk of mechanical cows,
Or cows of another name,
Such as Guernsey, Jersey, and so forth,—
But me for Ayrshire fame.

And now you may talk of the Holstein
Whose milk profit isn't so lean,
But the Ayrshire's got 'er beat,
When you come to think of the cream.

My address is Route 1, Mechanicsburg, Pa. I would like to hear from other juniors.
Lester M. Shughart.

For as little as $75 with $20 down, you can

OWN A MUSKRAT FARM

In the best muskrat raising area in the world.

PROFIT BEYOND BELIEF

Positively the best paying legitimate business on a small investment to be found anywhere. Many of our muskrat farm owners make more money annually without labor, from a farm of a few acres than they have ever made on salary. You need not give it a minute of your own time.

We Farm It For You Professionally

Our long experience in raising muskrat and our ownership of more than 65,000 acres of the best muskrat land, makes it possible for us to farm your farm on shares and make it produce great volume, —more profit to you. There is always a ready and growing market for muskrat pelts. They grow rapidly under the proper care and surroundings. We have only a limited number of these farms to offer in sizes from 1 to 20 acres. Total price, $75 per acre which includes our farming contract. *Write for* information at once. It costs nothing to investigate.

MT. FOREST FUR FARMS
1421 Michigan Theatre Bldg., Detroit, Mich.
Properties in Louisiana, Mich., and Can.
Our business is the largest and one of the oldest in the industry. Assets over $1,225,000.00. Known to the best Fur Farming Trade Journals and to the best banking and financial rating agencies in Detroit.

Problems in Herd Improvement

(Continued from page 987)

cestors, these characteristics cannot be utilized to the fullest extent unless she is properly fed.

Many dairymen keep more cows than they can feed properly. They do not produce the required amount on the farm and they will not provide what is lacking from outside sources. They fail to adjust the size of their herd to the dimensions of their feed supply.

A comparison of two herds for one month is taken from the report of an Indiana cow tester. Herd A made an average production of 276 lbs. milk and 10.1 lbs. fat. The income over feed cost per cow for the period was $2.48, or a total receipt of $74.40 from the herd of 30 cows. From the time the herd was turned to grass early in the spring until early in December a poor piece of bluegrass pasture furnished all the feed.

Herd B comprising 14 cows received grain each month in the year and a little hay when pastures were short. They averaged 602 lbs. milk containing 26.1 lbs. fat and returned an income for the same month (May) amounting to $132.16, nearly double the income from a herd only 47 per cent as large. It is difficult to understand why men will continue to keep cows and give them such poor care.

An abundant supply of legume roughage is the first essential in providing a suitable and economical winter ration. Some one may take exception to this statement and place silage at the top. We cannot agree. When we consider that it requires 1,000 lbs. of silage to provide as much digestible protein as 100 lbs. of alfalfa hay and since protein is the most expensive part of the dairy ration, legume roughage must occupy the premier position among our winter roughages.

The grain mixture should be balanced according to the kind and amount of different roughages available. The digestible protein content should be about 20 per cent when all the roughage is of the non-legume group. If, on the other hand, as much as one pound of alfalfa, soybean, or clover hay is fed for each 100 lbs. of live weight daily in addition to silage, good results will be secured from a grain mixture car ing around 12 per cent digestible p tein. When the hay is a mixed riety the concentrates should be lected as to be intermediate in percentage protein they supply.

A ration may be well balanced exhibit all of the requirements a ciated therewith and yet not be nomical because it is not fed acc ing to the daily production of e cow. The illustration already refer to where the income increased f $24.77 to $63.28 in one month w the only change made was feed the grain according to the product of each member of the herd is pr of this.

If every member of the 900 testing associations would set out provide at least one acre of legu hay for each mature animal in herd and feed her a balanced gr ration based on the daily milk f the increase in income above f cost would pay for all the expens operation and leave a substantial come besides.

The value of the cow testing a ciation is generally recognized to in districts where dairying is car on as a major industry. Decrea cost of production accompanied larger yields is being accomplis by weeding out the lowest produ and feeding a ration that more ne meets the needs of the remainder.

From time to time difficulties arise regarding reorganization, ciency of the tester, and the like the principle of "feed, weed, breed" is a sound one and the a ciation which turns the searchl of persistent effort and fearless t on the "I"nefficient tester, the " different member, the "I"nferior mal, and the "I"nadequate ra long enough and strong enough continue to have an efficient med for increasing their dairy dollars

HAVE A CAMEL

Camel wins on quality!

THE greatest cigarette success ever known is Camel—the quality smoke. Camel brought the world a new understanding of smoking pleasure and the world raised it to first place. No other smoke can compare with Camel in popularity, and it is climbing higher and higher in favor every day.

We invite you to try Camels for just one reason—enjoyment. You will revel in the taste of these choice tobaccos. Always so mild and smooth, there never was a smoke that could compare with Camel in lasting satisfaction. Smoke as many as you will, your enjoyment will grow keener every smoking hour.

Regardless of how much you pay, there is no better than Camel. Camel leads the world!

Mem'ries

There's lots o' things that's sacred-like
You treasure in yer heart;
They twine theirselves around you tigh
And somehow won't depart;
The love you give yer childhood home;
Yer pap and mammy there;
The mem'ries of 'em spring up sweet
And sanctified and rare.
The places where you romped and play
And learned to cuss and smoke;
The orchard where you gorged yerself
Until you liked 'a broke;
Yer fav'rite tree you used to climb
And play you was a bird,
A perched amongst the branches
Where the breezes kept 'em stirred;
O, there's lots o' just such things as the
A man'll hoard and keep
Refreshin' in his mem'ry
Fer they've come to mean a heap.

And high chairs! Ain't it funny
What the sight o' them 'ud do
All dusty in an attic
With the shadders streakin' through
The kids is little once agin
They need yer love and care;
You see a heap o' precious things
Around an old high chair!
Yer baby sets there now and then;
You see it plain as day;
Its curly head goes down—and down—
You hear its mother say,
"Poor precious lamb, sweet baby dear,
He's played and played and play—"
And there she stoops and picks him up
He nestles in her breast,
With you a gazin' on the pair
Uncommon rich and blest.

O mem'ries sweet and rare spring up
To link you with the past
The things you really cared about
Are stored away to last;
A spoken word, a sigh er song;
A step upon the floor
'Ll bring 'em back from where they've le
Fer thirty years er more.
They're flowers planted when you're yo
To blossom when you're old;
The flowers of yer bygone youth
The march o' years unfold.

The Hunter of Kewaunee

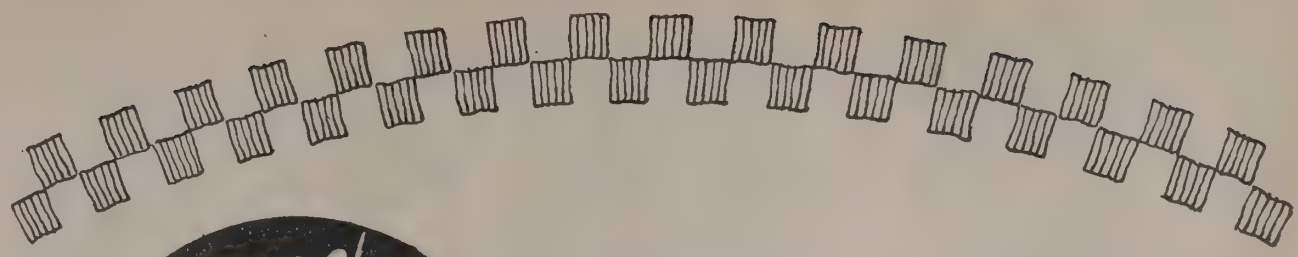
(Continued from page 989)

n, accompanied by about thirty of best men, went forth to reconnoi- They divided into two bands and tly found their way through the p forests. Arriving at the place r which the Indian scout claimed had seen Indians, they were sur- ed to find fresh signs of Indians ywhere. While investigating the ndoned camp they were suddenly tled by the shrill war whoop of Indians in their rear. They were ctically surrounded by the enemy. hey were nearly all killed or cap- d after a furious fight, and Joan re was burned at the stake near tract of land that had been grant- im by the Crown. During my boy- d days, grandfather and his broth- and sisters laid claim to the prop- given by the land grant but be- se the land had been taken by con- st several times and no claim filed nearly a hundred years, the land nt was nullified.

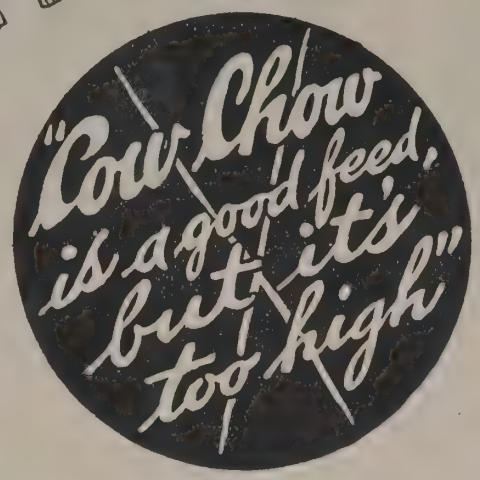
Adventures with Panthers

y grandfather had some thrilling entures with the panthers in the rondacks.

hese vicious animals, which were n called painters, became so bold o attack people and either kill or ribly mangle them. The state be- e alarmed at their depredations placed a bounty of $60 a scalp. grandfather, being a skilled dsman and a deadly shot, under- the task of securing some of the nty money.



n one occasion he started out on a l tracking snow in quest of pan- 's. He traveled from early morn- until noon with no signs of the nal. Soon after eating lunch in the st, he came upon a fresh track followed it until night. He ped for the night and proceeded next day but did not come up to animal. Although the animal had nt the night less than a quarter of ile from my grandfather's camp- place, there was no evidence that uspected he was being trailed.



seemed he had a certain destina- to reach and he did not tarry on way. At one point the ravenous nal had pounced on a rabbit. In afternoon of the third day, the nal gave evidence of being hungry. went through the thickets in ch of partridge, mice, or rabbits. about three o'clock the panther killed a fine deer as easily as a would kill a mouse. Although the was a two-year-old buck and e were six inches of snow on the nd, the panther had carried the ass in his jaws without any part touching the snow.

s soon as this discovery was made, ndfather knew he was near the e and moved very cautiously. Be- e panthers dislike taking their ls on the ground, grandfather fully surveyed the logs and trees. deer was killed on a ridge border- a swamp. Expecting to see the her any second, or hear his heart ing warning shriek, grandfather eeded after his treacherous quar- A few rods within the borders of swamp, a dead tree had fallen in- he forks of a birch tree giving it ncline of about 45 degrees. The her had leaped up the slanting and taken his deer into the tree . Very seldom can man approach of these sly, vicious animals with- being discovered, but the panther so intent on finishing his meal he was unaware of immediate er.

ith unerring aim the old trust- hy rifle was sighted and the trig- pulled. A terrifying shriek, a ity leap, and the panther fell dead at the feet of my grandfather! This panther was rated as one of the largest and most beautiful specimens that had ever been killed in the state down to that period.

[EDITOR'S NOTE—This is the first installment of "The Hunter of Kewaunee." The author, Professor R. A. Moore, head of the Agronomy Department of the Wisconsin College of Agriculture, tells an intimate personal story of the progress of agriculture and civilization in America during more than a hundred years. The next article finds the Moore family trekking westward.]

Don't fool yourself! Purina is *not* too high. More than 50,000 dairymen in all parts of the country are making more net profit from their herds by feeding Cow Chow.

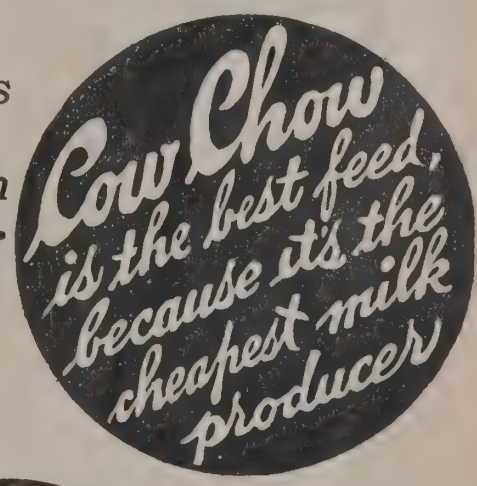
They include:

Leading pure-bred men

Leaders of cow testing associations

Certified farms

Retail dairymen

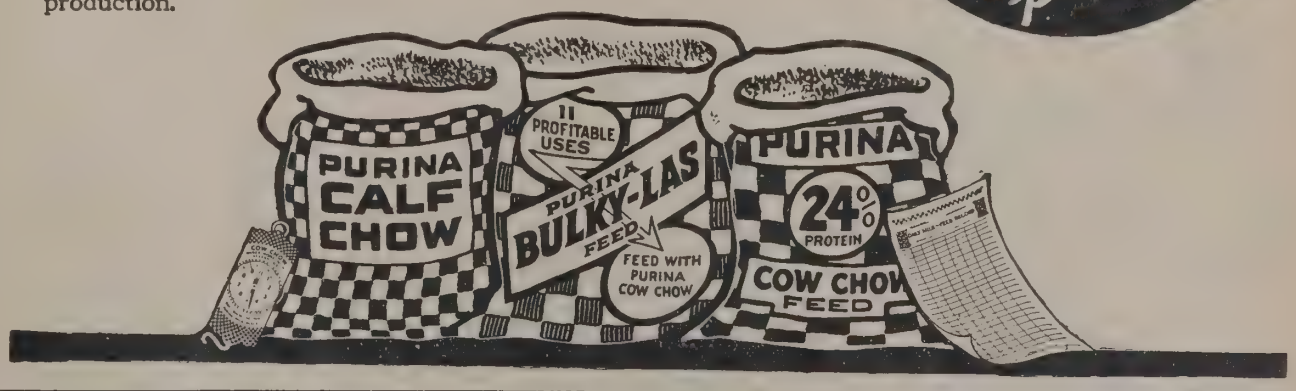


Grain farmers who sell cream

Family cow owners everywhere

Some of them are your own neighbors—just good average farmers, handling their places under ordinary farm conditions. These men are saying a feed which lowers their cost of production *cannot* be too high. They say the feed which pays them the most profit is the cheapest they can buy. All of them are feeding Purina today.

When men like these can make more money by feeding Cow Chow, *you* can too. Order Cow Chow from the feed store with the checkerboard sign.



Thousands of dairymen say—

Let Bulky-Las work with Cow Chow in increasing your milk production.

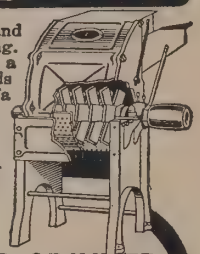
Creamery Growth



Steady growth has marked the 20 years since the Farmers' Co-operative Creamery of Milaca, Minn., was organized and the creamery is now one of the largest in Minnesota, and the largest unit of the Land O'Lakes Creameries, Inc. Its output in 1926 was 1,146,610 pounds butter, of which 90 per cent graded Land O'Lakes quality.

The creamery company was organized in January, 1907, with an authorized capital stock of $5,000. Seventy-four men bought stock, paying a total of $1,870 into the treasury. The number has now grown to more than 600. The building erected in 1907 was greatly enlarged and improved in 1920. At present the creamery is producing an average of 35,000 pounds of butter per week.

Several departments have been added during the years, and sales by the departments for 1926 were as follows: creamery, $484,143; merchandise department, $111,679; feed mill, $5,577; egg department, $49,445; poultry department, $14,649; making a total of $665,493.—Agricultural Co-operation.

Grind All Your Feed-Stop Waste!

STOP costly waste and guesswork in feeding. Make your feed go a third further. Grinds oats for pig slop—alfalfa for chicken mash. The W-W Grinder turns "roughage" into dollars. Makes valuable mixed feed of alfalfa, grain, snapped corn, fodder, bundle feeds, etc. Saves high priced hay. Grinds everything from the ground up with lightning speed.

W-W HAMMER TYPE FEED GRINDER

The World's Greatest Feed Grinder!

No burrs, gears or knives. Powerful hammers do the work. Timken heavy duty roller bearings. Five sizes—elevator or blower. 14 Years successful service.

Write for literature and feed samples. Tells how other W-W users make their feed go further. Write today.

Putting Sows in Condition for Breeding

Sows bred on November 7 will farrow on or about February 27 and this reminds us that the breeding season for swine is just around the corner.

We are immediately concerned with getting sows safely in pig as also promoting the conception of a large number of pigs per litter.

This is best accomplished by applying a method to swine commonly known among sheep breeders as "flushing." No one that we know of has definitely measured the comparative beneficial results of this practice as applied to swine but many practical producers testify to its helpful effect.

On the theory that the breeding function is greatly stimulated by a vigorous and rapidly gaining condition, the practice consists in liberal feeding for several weeks immediately previous to and at breeding time. Plenty of exercise is also known to have a beneficial effect.

It is known that the number of pigs in a litter is limited to not more than the number of female germ cells, commonly called ova, that are released at the heat period and time of conception. Assuming that the male sperm cells are normal in number and potent in function, anything that promotes the production and release of ova has an influence on the number of pigs per litter. It is thought that when thin sows are made to gain rapidly just before breeding, a larger number of ova are exposed to fertilization.

Mature sows that farrowed spring litters and have been carried along cheaply on pasture and a little grain and sows that have just weaned fall litters are now in ideal condition to respond to liberal feeding by which we mean they should be made to gain from three-quarters of a pound to one and one-quarter pounds per head daily.

The amount fed will, of course, depend on the character of the ration as also on the condition of the sows. Sows that are already in good condition will be benefited more by considerable exercise than by an increase in feed.

As a rule, gilts to be used for breeding purposes have been pushed rapidly to as much growth as possible. They should be continued on rations that promote growth. Their rations should contain slightly more protein than rations for older sows.

As long as weather conditions are open so that sows would take the run of a field if given opportunity, they should be given this range and what forage they can get.

Not forgetting the boar at breeding time let us say that he should be made physically fit by plenty of exercise and just enough feed to make him look well satisfied with his keep.

Many a young boar has been ruined by too much work while some old boars have had their potency impaired by being too fat.

In the foregoing discussion we bring you what we believe to be one of the most important immediate problems in swine management. To do the most important thing at the right time is the essence of good management.

Increasing Gain on Less Feed

Making 100 lbs. gain on pigs with the lowest feed cost is, at all times, an essential part of good swine management.

If, for any reason, the price of the basic grain normally fed is comparatively high, the problem of making cheaper gains is made more difficult of solution. It becomes a problem of either substituting cheaper feeds that will take the place of corn, for example, or of combining feeds in such a way as to reduce the amount of the basic grain needed.

Inasmuch as cereal grains and their by-products are deficient in essential minerals and vitamins, as also the best quality, growth-stimulating proteins, the reduction of basic grain by proper combinations of feeds offers a way out of the difficulty.

During the summer, pasture forage of one kind or another usually makes up the deficiencies of cereal grains and their by-products. But pasture forage is not available in winter in northern states with the result that altogether too large a proportion of grain is used in swine rations.

To show what a little thing will do in this respect we quote from some feeding work done at the Ohio Station.

One lot of pigs averaging 43 lbs. each was fed corn alone in dry lot; they gained 0.43 lb. per head daily and required 685 lbs. of corn for 100 lbs. gain.

The experiment was made at a time when feed and hog prices were comparatively high. Price values used were as follows: corn, $1.68 per bushel; tankage, $120 per ton; skimmilk, 60 cents per 100 lbs.; hogs, $16 per 100 lbs.

On the basis of the above figures 100 lbs. of gain cost the value of 685 lbs. of corn, or $20.55. The hogs sold for $16 a hundred.

A second lot of pigs averaging 43 lbs. each was fed corn and tankage in the proportion of 9 of corn to one of tankage. The pigs more than doubled the rate of gain when compared with the corn fed lot, gaining 0.89 lb. per head daily on a feed consumption of only 350 lbs. corn and 38.9 lbs. tankage per 100 lbs. gain. This 38.9 lbs. tankage reduced the corn requirement by 335 lbs. which at 3 cents a pound, $1.68 a bushel, amounts to $10.05 against which we charge the tankage at 6 cents a pound, $120 a ton, or $2.33, thus effecting not only a saving in corn but also bringing about a more rapid and cheaper gain. These pigs netted $3.16 per hundred pounds above f cost.

A third lot of pigs averaging lbs. each was fed corn and skimm in the proportion of 1 lb. corn 3 lbs. skimmilk. They required 25 lbs. corn and 770 lbs. skimmilk 100 lbs. gain. The feed cost $12.32 per hundred pounds gain; hogs sold for $16 per hundred.

This 780 lbs. skimmilk reduced requirement for corn by 428.3 for 100 lbs. gain when compared w feeding corn alone. No farm would object to selling 780 lbs. sk milk for $12.85, the value of the c it replaced.

Farmers should not be mislead believe that skimmilk will have high a feeding value under other c ditions. The experiment shows t no farmer can be so extravagant to feed corn alone.

For winter feeding the Ohio S tion finds that one of the most cient rations is one made of c tankage, skimmilk, and minerals c taining finely ground high calci limestone and salt. In the abse of skimmilk they suggest in addi to corn a supplemental mixture o parts tankage, 2 parts linseed mea parts alfalfa meal or hay, and part limestone.

Minerals for Swine

The mineral requirements of has been a subject of much exp mental work and some controve for several years. The Ohio Stat makes the following brief report some work done to test out the fectiveness of several substan commonly used in mineral mixtu

Feeding investigations with sw during the year included a test study the effect of adding var minerals to the simple mixture of 1 part, limestone 2 parts, and bone meal 2 parts. This mixture the various additional minerals w fed with a ration of corn and bean oil meal which is known to deficient in minerals.

Glauber's salts, which is a laxat was fed at the rate of 10 lbs. in e 100 lbs. of the mixture. The s did not increase the rapidity growth but brought about a sli saving in feed for each 100 lbs gain produced.

Wood charcoal, to the extent 15 per cent of the mineral mixt resulted in neither faster nor che gains.

Potassium iodide, in the lim amount of .05 pound to every lbs. of minerals, proved to be b ficial. It is used as a preventiv goiter, and under some conditi seems to have a place in mineral tures for growing pigs.

Copperas, or iron sulphate, was as a source of iron and fed at rate of 2 lbs. in each 100 lbs. of erals. The pigs receiving it mad lb. more gain daily a head, and sumed 52.5 lbs. less feed for each lbs. of gain than those on the s ration without the copperas.

Making a Hundred-pound Shote

A few years ago the Kansas tion started some weanling pigs o alfa pasture with a view to de mining the amount of corn and t age required to bring them up to lbs. weight.

The heavier pigs, weighing ab 52 lbs. at the beginning, require days to reach 105 lbs. weight; lighter pigs weighing 43 lbs. requ 120 days to reach 102 lbs. weigh.

Averaging all the groups it requ 153 lbs. corn and 14.4 lbs. tan per pig to reach the weights st The average daily gain was 0.5 l per pig.

Hollyhock Holsteins Average $835

THE dispersion of Gustave Pabst's Hollyhock Holstein herd Oct. 3—4 at Oconomowoc, Wis., marked the passing of one of the country's best Holstein breeding establishments. Mr. Pabst had built up an excellent herd but it grew to be a larger one than he wished to maintain and rather than hold a reduction sale, which is seldom satisfactory, every animal in the herd was included in the sale.

GUSTAVE PABST
Owner of Hollyhock Farms.

Everyone anticipated that this would be a banner sale and it was. The herd was one of the best, and back of it were men who have the confidence of Holstein breeders everywhere; the sale was well managed; and buyers from many sections who wanted the cattle and were willing to pay well for them were there.

One hundred and eight head sold for $90,225, an average of $835. Nineteen went for $1,000 or more, three went past $5,000, and one cow sold for $10,000. Sir Bess Ormsby Fobes was for years senior sire at Hollyhock and on sale day there were fifty of his daughters of all ages to be sold. They brought $41,025, an average well over $800.

Hollyhock Piebe Fobes, the 1926 grand champion at the National and all-American 4-year-old, was the outstanding animal in the herd. Freshening soon after her show ring triumph last year she made a 34.77-lb., 7-day record and will shortly finish her year with about 960 lbs. butterfat (1200 lbs. butter) which means a real combination of type and production. She came into the ring looking better than a year ago and her price quickly went above $5,000. From there two prospective purchasers, Winterthur Farms of Delaware and R. V. Rasmussen of Illinois, carried the bid on up until she was struck off to Mr. Rasmussen for $10,000. Her yearling daughter by Creation was purchased by Winterthur Farms for $2,925.

The second highest priced animal in the sale, May Pietertje Homestead Ormsby, an all-American daughter of S. P. O. M. 37th and of May Walker Ollie Homestead, was purchased for $6,000 by Femco Farms, Minnesota, who also owned her dam.

The only other animal to pass the $5,000 mark was likewise a daughter of 37th. Wisconsin Pride 2d, 10-year-old cow and U. S. champion 3-year-old producer, that Mr. Pabst purchased at the Erickson dispersion three years ago, sold to Femco Farms for $5,800. She should prove a valuable addition to the great group of breeding matrons which Mr. Murphy has assembled at his Minnesota farm.

J. SOUTHCOTT
Manager of Hollyhock Farms since their establishment.

Nine more of those animals selling for four figure prices were "Sir Bess" daughters and a tenth was the top-priced bull by Sir Bess and out of Wisconsin Pride 2d that went for $2,600.

Mack, Haeger, Thompson, and Hansen did the selling with Bob Melin in the box. The Melin—Petersen Co. managed the sale.

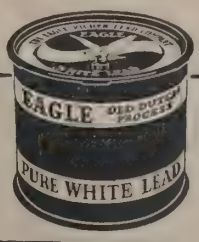
Following is a list of those animals selling for $850 or more and buyers:

John R. Armstead, Minnesota	
Creation	$1,400
Femco Farms, Minnesota	
May Pietertje Homestead Ormsby	$6,000
No. 1½	1,025
Wisconsin Pride 2d	5,800
Westmoreland Colantha 2d	1,000
Hollyhock Bess Sadie Alma	1,000
Hollyhock Bess Mechthilde Segis	1,000
Ouido Pontiac Trixie	1,300
Hollyhock Burke Rose Fobes	900
State Board of Control & H. F. Wittig, Wisconsin	
Princess Della 3d	$3,000
Shore Acres, Minnesota	
Hollyhock Della Fobes Ormsby	$1,075
E. A. Baker, New Hampshire	
Hollyhock Johan Pontiac Fobes	$1,050
Hollyhock Beauty Segis Fobes	1,700
Hollyhock Bess Sadie Rhoda	3,050
W. S. Kellogg, Connecticut	
Hollyhock Alma Coin Fobes	$1,050
Hollyhock Lady Bess Daw	2,000
Elmwood Farm, Illinois	
Hollyhock Piebe Fobes	$10,000
Dell Lyons Model Korndyke	875
Winterthur Farm, Delaware	
Hollyhock Piebe Creation	$2,925
John Carroll, Illinois	
Hollyhock Banostine Fobes	$1,200
C. H. Anderson, Maryland	
Pride De Kol Milk Maid	$1,350
Mission Farm, South Dakota	
Sir Bess Ormsby Fobes 69th	$2,600

HOLLYHOCK PIEBE FOBES, GRAND CHAMPION DAUGHTER OF SIR BESS ORMSBY FOBES
She was purchased at the Hollyhock dispersion for $10,000 by R. V. Rasmussen, Illinois.

YOUR BUILDINGS

the ASSETS everybody sees



THE appearance of farm buildings is the visible standard by which a farmer's customers and neighbors judge his good management. Your buildings, painted white or light colors with Eagle Pure White Lead in Oil, indicate careful attention to economy. They provide cheerful surroundings that add to the health and happiness of everyone on the farm.

Farmers who have painted with Eagle know its economy in first cost. When repainting time comes, they realize another economy of pure lead paint. It wears away evenly, slowly. It is tough and elastic—does not crack or peel off—leaves a perfect, deep-anchored foundation for repainting.

Leading paint dealers sell Eagle. *The Eagle-Picher Lead Company, 134 North LaSalle Street—Chicago.*

[You will appreciate the many helpful suggestions for mixing white lead paint contained in our "Tinting and Mixing Chart." Write today for your free copy.]

You *can't afford* To Milk by Hand

WOULD you go back to the hand scythe or cradle? No! And you can't afford to milk by hand any more than you can afford to mow your hay with a scythe or cut your grain with a cradle. And why should you be tied down to a never-ending grind—twice a day, seven days in a week, when thousands upon thousands of farmers have taken the drudgery out of dairying and increased their profits at the same time with a Burrell Milker. It will milk your herd so much quicker, better and more safely than hand milking. And, with the Burrell Milker, the work of hand stripping is also eliminated—*It Milks the Cows Clean.*

DAIRY MARKET NEWS

September Foreign Butter

The following table of foreign butter prices gives the average weekly quotations as published by the U. S. Department of Agriculture:

Market	Sept. 1927	Aug. 1927	Sept. 1926
	Cts.	Cts.	Cts.
New York	46.5	41.9	44.6
Chicago	45.0	41.5	43.1
Copenhagen	39.5	35.0	36.3
Berlin	40.5	37.1	36.7
London			
Danish	41.5	37.7	39.0
Dutch	40.5*	36.3*	36.3
New Zealand	38.9	36.8	35.3
Australian	38.0	36.3	34.4
Argentine	37.2	34.8*	35.0
Siberian		31.4	29.2

*Unsalted.

September Cheese

The wholesale price of cheese on the Wisconsin boards averaged 25.3 cents in September, an advance of 1.3 cents over August and nearly three cents over September of a year ago. This is the highest September price since 1920. During the first half of October prices advanced a half cent and the markets held firm.

Cheese production for the first eight months of the year totaled 290,253,000 lbs., a decrease of over 26 million pounds from last year. Net imports were 47,385,000 lbs., an increase of 10 million pounds over last year. Storage holdings of American cheese on September 1 declined 11 million pounds from last year and of other cheese types increased 3½ million pounds. This brings the total estimated trade output to 319,280,000 lbs., a decrease of 5.2 per cent in apparent consumption as compared with the same period last year. Judging purely on statistics, the advanced price of cheese has apparently curtailed consumption.

Daily quotations from the U. S. Department of Agriculture show the following average wholesale prices for American cheese on the Wisconsin Primary Market during September:

	Sept. 1927	Aug. 1927	Sept. 1926
	Cts.	Cts.	Cts.
Twins	24.7	23.3	21.5
Single Daisies	25.3	24.0	22.2
Longhorns	25.8	24.5	22.4
Square Prints	26.2	24.7	23.3
*Receipts since Jan. 1	161,065	140,668	147,291
*Receipts for month	20,396	20,489	17,140
*Storage end of month	14,170	14,679	22,642

*In thousands of pounds at Chicago, New York, Boston, and Philadelphia (i. e.—000 omitted.)

Sheffields in September

The cash price for September, 1927, paid Sheffield Producers for three per cent, Grade B milk in the 201—210-mile zone is $2.73 per hundred pounds with the usual freight and butterfat differentials. This is equivalent to $2.93 for 3.5 milk and is an increase of 19½ cents over the price for September, 1926, and an increase of 29 cents over August, 1927.—C. W. HALLIDAY, Secretary.

Wisconsin August Butter

Wisconsin co-operative creameries paid producers a net price of 46.6 cents a pound for butterfat in August according to reports from 72 of these creameries to the Wisconsin Department of Markets. These creameries received an average of 41.9 cents a pound for butter, making spread of 4.7 cents between the price received for butter and the price paid for fat.

The range in prices paid for fat was from 41 to 51 cents, with the price received for butter ranging from 39 to 43 cents. The overrun ranged from 22 to 24 per cent. Receipts of butterfat averaged 31,876 lbs. per creamery.

Cold Storage Holdings

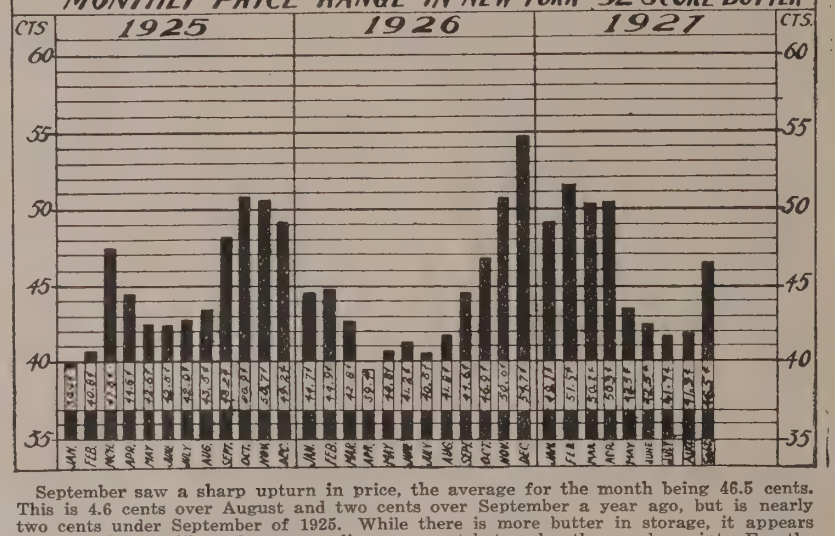
(U. S. Department of Agriculture)

The following is a report of the cold storage holdings of dairy products on October 1, figures being given in thousands of pounds (000 omitted):

	Oct. 1 5-yr. ave. Lbs.	Oct. 1 1926 Lbs.	Oct. 1 1927 Lbs.
Butter, Creamery	117,161	125,342	147,412
Cheese, American	68,248	77,646	65,434
Cheese, Swiss	6,993	7,286	7,744
Cheese, Brick	1,771	1,442	1,858
Cheese, Limburger	1,406	1,829	2,128
Cheese, All Other	6,814	7,182	7,944

These holdings include stocks in both cold storage warehouses and packing house plants.

August Dry Milk



(From Report by U. S. Dept. of Agriculture)

The wholesale prices given below are based on reports from manufacturers governing actual sales f. o. b. factory during August:

Dry Skimmilk: Prices ranged from 7 cents to 11.5 cents for dry skimmilk in bulk, averaging 9.24 cents a pound for sales, totaling 6,615,292 lbs.

Dry Whole Milk: Prices ranged from 22 cents to 27.5 cents for dry whole milk, averaging 25.84 cents for sales totaling 299,685 lbs. When packed in one-pound cans the price reported was 46.9 cents a pound.

Dry Buttermilk: Prices ranged from 6.5 cents to 10.5 cents for dry buttermilk in bulk, averaging 8.24 cents a pound for sales totaling 2,159,638 lbs. When packed in one-pound cans the price reported was 10.03 cents a pound.

September saw a sharp upturn in price, the average for the month being 46.5 cents. This is 4.6 cents over August and two cents over September a year ago, but is nearly two cents under September of 1925. While there is more butter in storage, it appears to be moving readily and new supplies are somewhat under the usual receipt. For the first half of October prices at New York were maintained at 49 cents, only dropping near the close of the two weeks to 48 cents.

September Butter

Butter averaged 46.5 cents in September on the New York market. This is an increase of eleven per cent over August and four per cent over September of a year ago, but is a decrease of nearly four per cent under two years ago. The market held at 49 cents in New York for the first two weeks of October, with indications of some decline toward the close.

Storage holdings of butter have materially increased, but recent indications are that these will be materially reduced. Perhaps the outstanding feature of the month was the strength of the market on fancy grades, a condition that does not apply to the lower grades. The difference between 92-score and 88-score butter being as high as 7½ cents.

Creamery butter production for the first eight months of the year was 1,074,322,000 lbs., an increase of 22 million pounds over last year. Net imports were 4,137,000 lbs. as compared with 446,000 lbs. a year ago, indicating that the price advantage in our markets allowed foreign butter in considerable quantity to scale the 12-cent tariff wall. Storage holdings were 163,037,000 on September 1, some 7 million pounds greater than the previous record in 1924 and nearly 25 million pounds in excess of a year ago. This brings an estimated trade output of 1,379,070,000 pounds for the first eight months of the year, a decrease of nearly 30 million pounds in apparent consumption of butter as compared with the same period of last year.

Daily quotations from the U. S. Department of Agriculture show the following average wholesale prices on 92-score butter (extras four of the principal markets, together receipts and storages:

	Sept. 1927 Cts.	Aug. 1927 Cts.	S
Chicago	45.0	41.5	
New York	46.5	41.9	
Boston	46.2	42.1	
Philadelphia	47.5	42.9	
*Receipts for month	41,277	53,302	4
*Receipts since Jan. 1	464,770	423,492	45
*Storage (end of mo.)	68,090	75,090	6

*In thousands of pounds at the four ma (i. e.—000 omitted.)

Ninety-score butter averaged 42.6 cent September in Chicago, with centralized b at this market selling for 42.1 cents. Job prices on extras sold to retailers averaged cents in Chicago, a spread of 2.5 cents wholesale.

September Condensed M

(Report by U. S. Department of Agricul

Prices paid producers for 3.5% milk f. factory were as follows for September, ing those factories manufacturing both and bulk goods:

Geographic section	Price per c Range
New England	$2.14
Middle Atlantic*	2.22—2.90
East North Central	1.91—2.40
West North Central	1.75—2.03
North Western	1.79—1.90
South Western	1.75—2.10
United States	1.75—2.90

*Fifty-nine additional factories re prices based in part on current month's sale butter quotations. Twenty-three fac reported prices not determined as yet a reported factories closed.

Manufacturers' wholesale selling pric sweetened condensed and unsweetened rated milk were as follows for August:

	Range
Condensed, per case	5.60— 6.65
Condensed, per cwt.	9.25—13.00
Evaporated, per case	3.44— 5.20
Evaporated, per cwt.	6.58— 9.30
Condensed skim, per cwt.	4.75— 7.00
Evaporated skim, per cwt.	2.88— 6.45

The Feed Market Situat

(By The Grain, Hay and Feed Market Service, Bureau of Agricultural Econ U. S. Department of Agriculture.)

The feed market situation has not ch materially during the past two weeks this writing (October 7) prices of the cipal feeds are practically the same a weeks ago with the exception of cott meal and gray shorts. Cottonseed meal have advanced $1—$1.50 per ton while shorts have declined 50 cents to $1 pe Demand continues of only moderate volu pasturage is still abundant in most sc and prospects for this season's crop co to improve.

Offerings of Bran and Middlings Lag

The production of wheat feeds cor fairly heavy although total output this at the principal milling centers based flour production is still below last year' duction for this period. The smaller tot duction is due principally to the smaller ings by the southwestern mills early th son. The demand has been sufficient to the offerings practically as rapidly a have come on the market.

Canadian wheat feeds are being offe eastern markets below quotations from eastern and southwestern mills. Mixe manufacturers in the Central States hav the principal buyers of feed from the western mills and also of bran for shipment from Minneapolis and other n the spring wheat territory. Bran pric practically unchanged from two weeks a are on an average $3—$4 per ton highe at the first of October last year.

The sharp decline which has occur middling prices since the first of Augu apparently been checked. Standard mi are now about $9 lower than at the August but are still about $4 higher th year. Increased offerings of spring middlings have been largely responsi the downward trend in prices. At the ent time standard middlings from Min lis are being offered in the south markets at a discount under hard i wheat shorts.

Continued increased production of meal has weakened the market for that Minneapolis and prices have tended do but light production in eastern marke held prices firm in that territory. The for meal continues active and current p tion is reported to be readily taken. of this feed are about $2.50 per ton quotations last year at this time n standing the domestic supply of flaxs about 5,000,000 bushels larger than las Higher prices of other feeds, particular

(Continued on next page)

LaPorte County Calf Clubs

C. E. ZARTH, INDIANA

N inspiring demonstration as to the value of well planned calf club work was found in the exhibition of 35 Holstein and Guernsey heifers at the LaPorte County, Indiana, Fair. This exhibit was the outstanding feature of the cattle show and the center of attraction, proving that when properly taught boys and girls can feed and fit dairy animals in a highly satisfactory manner. Two-year-old heifers were selected on account of the quick return on the investment and as several of these are now in milk, the wisdom of selecting animals of this age has been proven. The cost of the heifers upon delivery to the members, including a year's insurance, varied from $119.75 to $162.50. The animals were purchased in Fond du Lac County, Wis., and distributed March 16, 1927.

A tour was held June 29 attended by club members, their parents, and other dairymen with addresses by C. W. Newman and Mr. Earl Cooper, fieldman for the Holstein Association.

The feeding, fitting, and showing of the animals for the fair was unusually good. L. H. Fairchild made the placings for both breeds.

DISTRIBUTION DAY—GUERNSEY CALF CLUB

ONE OF THE STOPS ON THE HOLSTEIN CALF CLUB TOUR

Earl Cooper, fieldman of the Holstein-Friesian Association, giving a judging and fitting demonstration.

The Feed Market Situation

(Continued from page 1020)

ed meal, are largely responsible for the er quotations on linseed meal.

Cottonseed Meal Higher

e cottonseed meal market continues firm quotations have been advanced $1—$1.50 ton since our last report. The higher s are restricting demand but with a rially smaller supply of cottonseed in ject crushers are not pressing their meal the market. Texas mills are paying $37 per ton for prime cottonseed deliv- at the mill and are quoting 43 per cent at $36—$37.50 per ton. Loose cotton- hulls are quoted at $5—$6 per ton. Con- ably less cottonseed meal has been shipped of the country this season, exports for ist totaling 15,122 tons compared with 4 tons last August. The European mar- or cottonseed meal has declined, however, quoted at Hamburg at the middle of mber at about $50.50 per ton, a decline out $4.50 per ton from earlier quotations. ile corn prices have tended downward g the past two weeks gluten feed prices held firm as a result of light production. slow demand for the commodities for n gluten and hominy feed are by-products rgely responsible for the limited produc- and is a more important factor in the et at the present time, apparently, than rice of corn. Practically all mills report output for October contracted for and ffering only sparingly for November ship- .

miny feed continues in good demand with ngs very small and most of the mills of- g only limited amounts for October ship- . Prices of this feed have declined in the rn markets, prices at Omaha being quot- this writing $1.50 lower than two weeks Prices in eastern markets are practically nged.

ice green alfalfa meal continues in ex- t demand with the supply below current rements. Offerings of Nos. 1 and 2 meal arger but feed manufacturers have been g this meal in large amounts, particular- Kansas City. Quotations for choice green are slightly higher but other grades are d practically unchanged.

Quoted October 5

ndard spring wheat bran: $26 Minneap- $29 Buffalo, $33 Philadelphia, $28.25 Chi- Hard winter wheat bran: $26.50 Omaha, $25.50 Kansas City. Soft winter wheat bran: $35 Philadelphia, $32 Cincinnati, $28 St. Louis.

Standard wheat middlings: $30 Buffalo, $33.50 Philadelphia, $30 Chicago, $27 Minneapolis. Soft wheat middlings: $42 Philadelphia, $41.50 Cincinnati, $37.50 St. Louis. Gray shorts: $33.50 Omaha, $33 Kansas City.

Cottonseed meal (43%): $43.50 Cincinnati, $43.25 at Kansas City, $37 Fort Worth.

Linseed meal (34%): $47.50 Buffalo, $51 Cincinnati, $48 Chicago, $45 Minneapolis.

Gluten feed: $39 Buffalo. White hominy feed: $41 Buffalo, $37.50 St. Louis. Alfalfa meal: $26.50 Chicago, $22.50 Omaha, $23.50 Kansas City.

Wisconsin September Condensery Prices

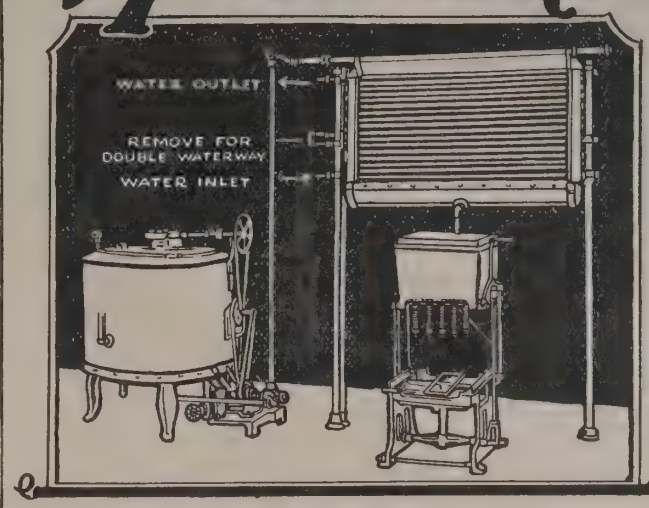
Forty-six condenseries reported to the Wisconsin Department of Markets the prices paid in September per hundred pounds milk delivered at their factories. Reduced to a common 3.5 per cent test basis, these prices ranged from $1.93 to $2.50, the average being $2.17.

Seventeen factories sent delayed reports for August, the average being $2.15. This is nine cents above the previously reported average of $2.06 for 49 factories.

Milwaukee September Milk

The Milwaukee Co-operative Milk Producers announce the following prices for the month of September:

For the portion sold as fluid milk, $8.00 per cwt.; and for the portion manufactured, $1.91 per cwt. These prices apply to 3.5 per cent milk delivered f. o. b. city, four cents being added or subtracted for each one-tenth of one per cent variation in test. Eighty-seven per cent of the total receipts were sold as fluid.



Philadelphia Milk Prices

The Inter-state Milk Producers' Association announces that the October basic price for milk will be $3.29 f. o. b. Philadelphia and $2.71 per hundred at receiving stations in 51—60-mile zone.

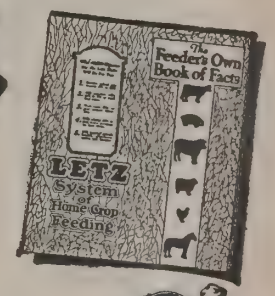
The September surplus price was $2.34 f. o. b. Philadelphia. The September surplus price at all receiving stations on railroad was $1.77.

These are based on milk testing 3 per cent butterfat with a differential of 2 cents for each half point of test up and down.

VICTOR DAIRY PASTEURIZER

for the FARM DAIRY and SMALLER PLANTS

REALIZING the need for a simple, efficient and economical milk pasteurizing outfit for smaller plants and farm dairies, *CP* offers the Victor, illustrated above.



The outfit consists of a combined heater and holder, sanitary pump and Alaska cooler. (Bottle filler is not included, but can be supplied at extra cost.) Operation is simple and conforms with all state health boards' requirements.

With a Victor Outfit the small dairyman can produce good, wholesome pasteurized milk just as cheaply and efficiently as the big city dealer. Pasteurization provides safe milk and will increase your business. The Victor is a business builder. Write for full information and prices.

Lower the Cost of Producing Beef

Fully 50,000 farmer owners have positively proved that you can lower the cost of producing beef, pork, mutton and dairy products with the Letz System of Home Crop Feeding. Their results show Letz Mixed Feed Makers will:

1. Save 25% to 50% of present feed crops by utilizing waste.
2. Release up to 30% of your present feed crop acreage for cash crops.
3. Increase milk and meat production up to 30% through better feed preparation.
4. Save up to 25% of labor in handling feed crops.
5. Improve health and condition of all farm animals.

Write today for your free copy of "The Letz System of Home Crop Feeding." It's full of valuable information and ideas that every stock feeder should have; information taken from the experiences of stock feeders in every state in the Union.

Worth $1 More per Acre Rent!

"I am a renter. I worked a farm for three years that was all fenced and cross fenced. Now I am on a farm that has very little fence. A well fenced farm is worth at least $1 per acre more rent and is worth $15 to $20 per acre more money than a poorly fenced farm." L. L. Nall, Canby, Minn.

E. W. Loy, Waynesville, Ohio, says:—"Don't expect your tenants to do justice to their crops while being aggravated by poorly fenced farms."

No man can chase stock and plow corn at the same time. Fence and cross fence hog-tight. RED BRAND FENCE, "Galvannealed," copper bearing will pay for itself in increased earnings in 1 to 3 years.

Thousands have used Square Deal fence for many years. Now, with copper in the steel and more zinc "Galvannealed" on to keep rust out, RED BRAND FENCE is better than ever—and costs less because it lasts longer. One-piece stays, wavy line wires, can't-slip knots keep it trim, true, hog-tight and bull-proof.

What has been your experience with or without good fence? We will pay $5 or more for each letter that we use. Write for details, catalog and 3 interesting booklets that tell how others have made more money with hog-tight fences.

Poultry

Pullet Finish

High records are becoming more common. Some few that approach or exceed 300 eggs in a year may be doubtful and made for advertising purposes but the great bulk are perfectly honest and legitimate.

There has been an ever increasing amount of attention given to breeding for higher production; better feeding has caused higher records; and more trapnesting has made these records known.

With the same conditions prevailing in respect to breeding, feeding, and housing, one will always find that pullets not only produce more eggs at a lower cost than hens but also produce the bulk during the season of highest prices. Probably this fact will help determine the per cent of hens and pullets that should constitute the average farm flock.

When egg production only is desired and no attempt is made toward mating but rather depend upon the purchase of baby chicks each year, it is undoubtedly advisable to replace at least 80 per cent and probably all of the hen flock with early hatched, well matured pullets. When it comes to a choice between late hatched, immature, poorly finished pullets and good yearling hens—keep the hens. A poorly finished pullet is at best a bill of expense.

It is at this season impossible to make or remake a profitable pullet out of an improperly reared chick. This is applicable to brooding conditions, feed, ration, or sanitation. Improperly reared pullets or parasite infested pullets are always a questionable venture. We can only hope for the best from them.

A good pullet should be early hatched and well matured at the time that production is wanted. One of the things that is particularly noticeable at the present time is the higher percentage of early hatched pullets that are found on farms each fall. The principal question at the present time is how to prevent early laying while it was how to get production from 1½-lb. pullets in the fall.

Leghorn pullets hatched about the middle of April and properly handled will be just about ready to start producing in October. Heavier breeds will usually require about an additional month for growth. A growing period of about 180 days is required for Leghorns and over 200 days for Rocks and others of about the same weight. Pullets producing in about four months are a "flash in the pan," cannot stand up for an entire year, and usually are a failure. They make nice advertising for the gullible but usually mighty poor producers.

Production should be controlled so that it does not start much before October 1. If controlled both by hatching and feeding until that time, the possibility of a winter molt is greatly reduced. Retarding production does not tell the entire story but is a big part.

For best production the heavier fowls should be about or a little below standard weight—5½ to 7½ lbs. On the other hand, a little larger size is desired in the Leghorns and they should weigh about 4—4½ lbs. When one gets them too big they are apt to be coarse and probably poorer producers. Small, ultra-refined pullets may make good short-time producers, but most of them cannot bat through for the year.

A good pullet has maintained a steady, consistent growth. She must be free from any disease, colds, or intestinal parasites. Health is indicated by deep yellow color in legs and beak of yellow skin varieties, red comb without any purple color to tip or blade, and bright, clean plumage.

In any flock, with any production, there are always some few birds that grow just a little bit slower than the rest, come into maturity a little later, and should be removed as culls. The first essential for good flock management means uniformity of flock so that uniformity in feeding may be followed. If one has birds of several ages it may be advisable to grade the pullets according to maturity and then change management in accordance with their needs.

Pullets when housed should be fat. This reserve, established before production starts, is what the pullet draws on during the period of heavy production. It is the reserve fuel supply that keeps the machinery in operation.

A good pullet has a bright, clean-cut head. The eye is large, bright, full, and prominent. The head should also indicate vigor by proper proportion between length and depth because those little round knob-headed pullets do not make producers.

It is probably possible to tell about as much about the pullet when on the floor as when handled. Any, when developed, that lack in body length or depth are questionable. Cull those especially with sunken eyes and V-shaped bodies. They tend to slope upward fore and aft from the legs.

When handling one should especially stress the need for a long, wide body. The width should be almost the same at the rear of the body as that which obtains across the hips. One will note this especially by runn one's hand across the back of a b and noting the width that prev along the sides.

Depth of body is usually measu by spanning from the hips to the k bone. No attention need be given either depth from pelvic bones keel bones or distance between vic bones. Distance from pelvic keel indicates depth which may measured from the hips to the and between the pelvic bones i cates only production and not proc tion possibilities.

Before production starts, the pu must be fat. After housing it is a question of regulating the consu tion of mash to grain so that proc tion is maintained without los weight rapidly. In fact a pu should gain in weight for about first year.

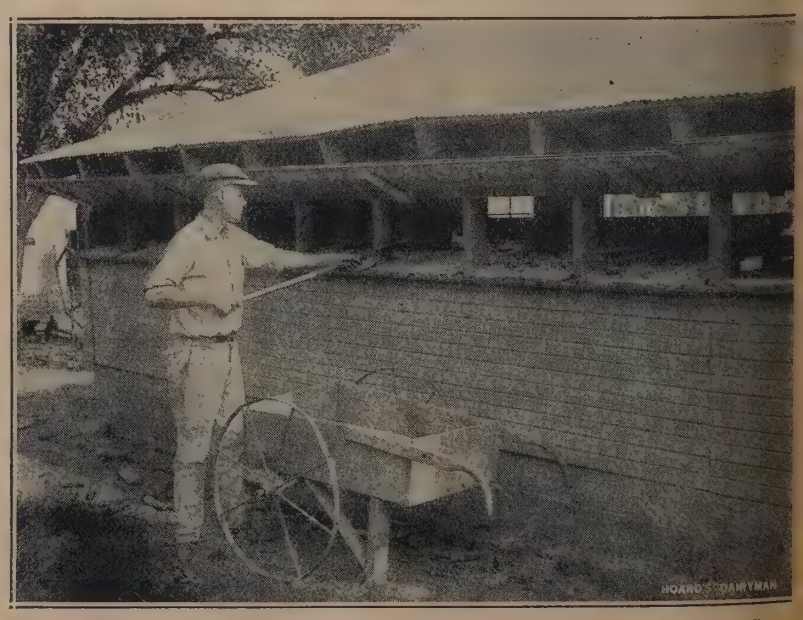
The use of a moist mash at noo addition to the dry mash that is per fed will tend to start a flock shorter time.

Select a real pullet. She must h vigor, growth, vitality, and the p er machinery to convert feed eggs. Any questionable pullet sh not be considered this year if on afraid of the present feed prices. good pullet can make a profit at time.—J. B. HAYES.

Effects of Feeding Bon Meal

Twenty pens containing 236 in all were used for comparing fertility, hatchability, and viabilit chicks produced when 5 per cen bone meal was added to a stand ration. The results showed tha the eggs produced by the birds re ing no bone meal 82.1 per cent fertile, 64.9 per cent of w hatched. The eggs from those re ing bone meal were 83.6 fertile which 61.1 per cent hatched. chick mortalities to three week age were 24.9 and 27.1 per cent, spectively.—Report of Canada periment Farms.

"Nobody Cares for Me



An old hen sat in a sycamore tree,
And said to herself, "No one cares for m
My food is what I find about
By scratching around till I'm frazzled ou

"My shelter is the starry sky.
I sit and watch the clouds sail by
Until my eyes grow weak and dim
When I take fresh grip on my sycamore

"Although I fly and scratch and make t hum
My owner claims I'm on the bum.
He wants an egg every other day
And thinks I ought to sing and lay.

"I wish he had to roost out here
And scratch bare gravel all the year,
I'll bet a copper cent, by Jing!
He wouldn't lay an egg till spring."

—From Extension Farm News, A. an College, Texas.

BRUCE HARDY, INDIANA, AND HIS ARRANGEMENT FOR CLEANING ROOSTS IN HIS POULTRY HOUSE

VETERINARY

dvice is given free in this department. iries must be signed by the writer, and ld pertain to veterinary matters only. re an immediate reply and prescription desired by mail, the inquiry must be ac- panied by a fee of one dollar. In every nce it will be necessary to give a full ription of the symptoms present.

Necrotic Sore Mouth

When milk runs back from the ith of a sucking calf and the cause ot found to be lodging of feed some other object between the gue and molar teeth or teeth and ek, one may find that it is due to sence of large and small ulcers n the lining membrane of the ith. They are called canker sores the dairyman, and are much like cold sores of the human lips. The st sores are caused by the filth n, bacillus necrophorus, invading mucous membranes lining the th, and sometimes the throat is lved. The latter is the most dan- us form of necrotic stomatitis, called "calf diphtheria," which is ighly infectious and often fatal ase.

igs also suffer much from canker s of the mouth and may also con- t the necrotic form of the dis- . The necrosis bacillus lives, nally, in the intestines of swine is therefore voided with the fe- of those animals and consequently unds wherever hogs have long n kept.

uch contaminated places should be occupied by young animals. old, dirty calf pen may also har- the germ, for it lives in any filthy e, and when canker or necrotic s are giving trouble it is impera- that the old infected pens be at abandoned and that unaffected es be moved into new, sanitary s, preferably well away from the stables and yards. The infected s may then be cleansed, disin- ed, whitewashed, properly light- and ventilated, and used for the mmodation of adult cattle or r farm animals.

o avoid necrotic diseases and in- ation by worms, pigs, from birth, uld be managed according to the s of the McLean County, Illi- , plan. A bulletin on that sub- may be obtained from the U. S. artment of Agriculture, Wash- on, D. C. It is equally important eep calves in sanitary pens from h and to cleanse and disinfect udders and teats of the cows be- calves are allowed to nurse for first time and then to keep them n fouling, so far as that is pos- . All utensils used for calf feed- must also be kept clean and ster- d.

reatment of canker sores and ne- ic sores consists in cleansing each hem and then scraping away all l or diseased tissue or pus. Af- rard the ulcers should be swabbed strong vinegar or dilute acetic . That acid has been found dead- o the bacillus necrophorus. Af- rard the ulcers may be swabbed y with a 2 per cent solution of ssium permanganate of potash, with a freshly made solution of urochrome, if the attending vet- arian thinks that will be more opriate. Tincture of iodine is al- xcellent for local application and, me aggravated cases, the veteri- an may use a solution of nitric , or lightly cauterize the sores a mild solution of silver nitrate. tment, usually, has to be applied rding to the conditions found in case, and these vary considera- It is, therefore, best given by xperienced veterinarian who will give such internal or hypoder- mic treatment as he deems necessary. Prevention, by perfect sanitation, is all-important.

Scours—Cholera

I have some hogs from 6 to 8 weeks old that have watery and foamy discharges from the bowels and it looks as though they might have some form of diarrhea. I have been feeding them all the skimmilk that they can drink and they have access to quack grass pasture. Would you kindly advise if you think it serious enough to take steps to check the loose movement and if so what would you advise giving them.

Also please tell me what hog cholera is like and what it is caused from and how to prevent and cure it.

Perkins, Mich. B. H. W.

Feed the skimmilk before it sours and remove the separator froth. Feed it twice daily from clean troughs. Also feed wheat middlings, ground corn, ground (screened) oats, and a little bran and tankage, dry, from a self-feeder. From another self-feeder supply salt, ground limestone, and wood ashes or steamed bonemeal. Add one-fifth pound of potassium iodide to each 100 pounds of mineral mixture. Let the pigs graze a succession of green crops, preferably legumes. Move them into new sanitary quarters on new seeding. If scouring persists, give bismuth subnitrate two or three times daily in doses of 15 to 30 grains.

Cholera may be suspected when hogs show high fever, stop eating, scour, cough, lie down most of the time, die in a few days, and show a purplish discoloration of the skin before or after death. There is no remedy, but the disease can be prevented by vaccination. Consult your veterinarian about that.

Pink Eye

Please tell me a good remedy for pink eye in dairy cattle.

Duncan, Okla. J. B.

Move affected cattle into a darkened stable. Bathe the eyes with a 3 per cent solution of boric acid several times daily and in the evening put a little bit of yellow oxide of mercury ointment (ophthalmic) in the corner of the affected eye and also apply it to the eyelids. If there is a heavy discharge from the eye wet the eyeball with a 15 per cent solution of argyrol, twice daily, after bathing with boric acid solution and when it subsides use the ophthalmic ointment. Feed a light, laxative ration.

Dehorning Calf and Cow

Please advise proper method of taking the horns off a calf three months old or would you advise leaving them now until the calf is older and using a dehorner? I have a cow which I wish to take the horns off. She is fresh three months and a heavy milker. Would you advise waiting until she is dry? Does it affect the next milking period by taking horns off a cow?

Selah, Wash. G. R. F.

Chemical dehorning cannot now be done nor do we countenance gouging out the stub horns as is done by some breeders. It would be best to wait until the horns are well grown and then removing them with dehorning shears. It is not advisable to dehorn a cow when she is well advanced in pregnancy, nor should dehorning be done in very hot or very cold weather or when flies abound. Postpone dehorning until autumn. As a rule, dehorning does not have an injurious affect upon subsequent milk giving.

Barrenness

I want some information about two cows. They have been bred about 8 times in the last 7 or 8 months and they keep coming back. They have both had several calves and are good cows. I also tried my neighbor's bull and the result is the same. I never had any trouble with either one before.

Farson, Wyo. J. E.

An infected condition of the lining membrane of the neck of the womb (cervix) or womb proper (uterus) commonly is the cause of barrenness in such cases. Infection of the contagious abortion disease often is present. To determine whether that is the case have a sample of blood from each cow tested by the agglutination method. Your veterinarian can have that done. Meanwhile he will have to give local treatment with antiseptics. Until you can have that done syringe out the vagina of each cow 3 or 4 times a week with bloodwarm (100 degrees F.) boiled water containing one tablespoonful of Lugol's solution in each 3 quarts. Isolate the affected cows. Feed them a complete ration and minerals.

Garget

Can you give me some advice on garget? We have three cows that have it very bad. We have changed their feed entirely. Have milked them as much as four times a day. Have used several remedies but it seems to be worse than when we started.

Cheyenne, Wyo. M. M.

Instantly isolate the three affected cows and then cleanse, disinfect, and whitewash the stalls they have occupied. The chief aim will be to prevent other cows from contracting the disease which is germ-caused. The infection may be carried from cow to cow by the milker's hands or be contracted by the fluid from a diseased quarter getting on the teats from the ground or a floor upon which it has been allowed to fall. Always catch the unsound milk in a vessel containing a disinfecting solution and then throw it out in a place from which cows are excluded. Chronic mastitis (garget) is incurable and if the affected quarters of the diseased cows are yielding milk or liquid containing pus, those cows should be fitted for the butcher after drying off the remaining secretion of milk. Have your veterinarian give the sound cows hypodermic treatment with mastitis bacterin to prevent infection. If desired he may also treat the diseased cows with anti-mastitis serum or bacterin. Keep the affected quarters stripped clean. Twice daily rub in a mixture of equal quantities of carbolized oil, camphorated oil, and compound soap liniment.

Infected Milk

I am informed that milk from cows having contagious abortion is unfit to use unless pasteurized. Is this true? I have a badly infected herd and do not want to use the milk if it is dangerous.

Aurora, Ind. J. D. C.

The fact that contagious abortion is prevalent among dairy cows and that the milk of affected cows has for generations been used by millions of people with seeming impunity would indicate that it is harmless, but some recent research work has shown that it is a possible menace. Malta fever of the goat and communicable to man through the milk of the affected nanny is caused by a germ very similar to that of the contagious abortion disease of the cow and there seems to be some evidence that supposed cases of Malta fever in man are sometimes really the drinking of the raw milk of abortion disease due to affected cows. Pasteurization of such milk would therefore seem advisable.

Eckles of Minnesota says 150 lbs. of whole milk and 75 to 85 lbs. of dry skimmilk will carry a calf until it will thrive on grain and hay.

Calf Scours

Abortion

Retained After Birth

CALF SCOURS is easily prevented and controlled by disinfecting new-born calves with dilution of B-K, and feeding them a little B-K. Get our book on Scours.

For removing Retained Afterbirth B-K in warm water loosens adhesions, stops inflammation, prevents fever and odors. The afterbirth comes away naturally; the parts are restored to health.

Abortion is caused by germs of several kinds. What they are and what can be done in prevention and control is told in our book.

B-K is Concentrated

you add water to use, the dilution costs

Only ½ to 2c a Gallon

The germ destroying power of B-K is 10 times greater than that of undiluted carbolic acid. B-K destroys germs by chemically dissolving them, yet B-K contains no poison, or acid, and leaves no odor.

B-K represents 15 years of scientific work. It is made by our exclusive process, producing the only stabilized hypochlorite ever approved by the American Medical Association.

B-K is dependable. Your money back if not satisfied.

LIVE STOCK FOR SALE

High class grade Holsteins—Springing or fresh cows from an area tested county. Can also supply Guernseys of top quality. Clean cattle, priced right. 30 years experience in breeding dairy cattle. Write me, JOHN ERICKSON, Waupaca, Wis. 18-*

For Sale—Holstein yearling bull; registered; grandson world's record cow. $125. DR. H. P. BEIRNE, Quincy, Illinois.

Holstein Bull. Three of his dams averaged 108 lbs. milk 1 day, 40.48 lbs. butter 7 days, $125. ROY HARRIMAN, Appleton, Wisconsin. 26-*

Purebred Holsteins, good blood lines. 10 yearling heifers, 10 cows, 2 bulls. MEADOW BROOK FARM, Independence, Iowa. 19-2

Registered Holstein Bulls from high producing dams and sired by 1000 lb. son of King Pontiac Champion. WALTER SORGE, Reedsburg, Wisconsin. 20-2

Pick of 20 Holstein springers out of 80 cows. Over stocked. FRANK W. FISHER, Janesville, Wis. 20-2

For sale or trade—5 year old bull, 1200 lb. dam. FRANK VANDERHEYDEN, Lanark, Ill.

If you want real choice Holsteins, any age or number, write H. E. ANDERSON, Whitewater, Wis. 2-24

For Sale—200 head of choice Holstein and Guernsey cows and heifers, consisting of five entire farm herds, at a reasonable price. WHITEWATER STOCK FARMS, Whitewater, Wis. 2-*

60 Choice Holstein and Guernsey springers. Also registered heifers, bred and open. Tested. F. B. GREEN, Evansville, Wisconsin. 20-6

For Sale—Fifty head of high grade Holstein and Guernsey cows due to freshen in thirty to sixty days. Priced to sell. JOHN KEENER, Amherst, Wis. 17-4

Always on hand, load of good dairy type Holsteins and Guernseys T. B. tested. Calumet County where the official tests in 1926 showed less than one per cent. T. L. DeLANTY, Hilbert, Wis., located on 57, 35 miles north of Milwaukee, Wis. 13-*

Young Bulls and Bull Calves, Dots Cherub breeding from dams with good A. R. records. QUINEILO FARMS, 607 Trust Company Building, Milwaukee, Wisconsin. 18-*

Guernsey Herd for sale. Strictly high class cows; some fresh; mostly to freshen soon; T. B. tested; will sell one or all. In village limits. JUSTAMERE GUERNSEY FARM, Mukwonago, Wis. Tel. 741. 8-*

High grade Guernsey and Holstein cows, springers and fresh. Car lots or less, T. B. tested. Registered bulls. H. R. LOBDELL, Mukwonago, Wisconsin, Waukesha County. Highway 61. 11-*

For Sale—50 high grade Holstein and Guernsey springers, reasonably priced. JOHN PETERSON & SON, Scandinavia, Wis. 19-*

Serviceable Guernsey bulls for sale. Records 500 to 675 lbs. New sale list. HOMER RUNDELL, Linwood Farm Guernseys, Livingston, Wis. 18-*

I have usually 100 head of high grade Holstein and Guernsey cattle on hand for sale. RALPH HUDSON, Milton Jct., Wisconsin. 7-*

Grade Guernsey springing cows and heifers are plentiful in La Crosse County. For prices write H. W. GRISWOLD, West Salem, Wis. 15-*

Guernsey bulls for sale. Accredited herd. JOHN MICHELS, Peebles, Wisconsin. 20-2

Registered Guernseys for sale. Both sexes. A. R. breeding. ROY BURTON, Eagle, Wis. 17-*

Registered Guernsey Bulls. Serviceable. FRANK KLEMM, Baraboo, Wis. 19-5

For Sale—Jersey bull calves out of heavy producing dams. A 5-year-old bull for sale. CLARENCE RAGSDALE, 709 Monroe Avenue, Moberly, Missouri.

Jersey bulls sired by son of Sophie's Emily, world's champion producer. Dams records up to 520 lbs. GUY WALKER, Fennimore, Wisconsin. 20-3

For Sale—Bull calves sired by pure bred Sophie Tormentor bull and out of extra good dams. Write C. F. KNECHTEL, Larned, Kansas.

Jersey Bull—Ten months old. Dam has cow testing association record of 508 lbs. butterfat in 8 months. J. H. FORELL, Charlotte, Michigan.

Pure Bred Ayrshire Bulls all ages. Federal Tested. G. A. STEELE, Elizabeth, Illinois. 20-2

Registered Brown Swiss bulls, 4 to 9 months, from high producing cows. WM. REHBERG,, Tomah, Wis.

LIVE STOCK WANTED

Wanted—Holstein Heifers, freshen in 60 days. Carload, good and priced right. CHAS. NOLAN, Timewell, Ill.

VETERINARY REMEDIES

Why blame the bull when your cow does not breed? Use Cow Catch 1 hour before service. Results or your money back; 85 cents for one cow, $2.90 for five cows, postpaid. WOODSTOCK FARM, Renton, Route 2, Box 49E, Washington. 17-*

FEED BAGS

For Seventeen years we have paid the highest prices to dairymen for their empty feed bags. Get our quotations before selling. THE DAYTON BAG & BURLAP CO., Dayton, Ohio. 4-*

STATIONERY

Your stationery represents you. Good quality paper with an illustration of your farm or members of your herd arranged nicely. Cost very little more than the cheap variety. If you haven't any pictures to reproduce on your letterheads and envelopes ask us for illustrations of what we carry in stock. Every breed of dairy cattle, and horses, swine and poultry are also included. Book of 5,000 farm ranch and cottage names, 25 cents. HOARD'S DAIRYMAN ART DEPARTMENT, Fort Atkinson, Wis. 26-*

SALESMEN WANTED

Sell Stock Feeding Molasses to feed dealers and farmers. Must have auto. Good proposition. Address FEDERAL FEED PRODUCTS CO., Box 1221, St. Louis, Mo. 19-2

AGENTS WANTED

Agents—We start you in business and help you succeed. No capital or experience needed. Spare or full time. You can earn $50-$100 weekly. Write MADISON CORPORATION, 564 Broadway, New York. 18-11

TOBACCO

Special Offer—Smoking 5 lbs. $1.00; ten $1.75; cigars 50 for $1.95. Pay when received. Money refunded if not satisfactory. FARMERS' ASSOCIATION, West Paducah, Ky. 19-2

Natural Leaf Tobacco—Best grade, guaranteed, 5 pounds chewing $1.00, 12 pounds $2.00; 12 pounds smoking $1.50, pipe free. Pay when received. VALLEY FARMERS, Murray, Kentucky. 20-4

ROCK PHOSPHATES

Our finely ground raw rock phosphate greatly increases yields of small grain and hay crops. Cheaper than acid phosphate. Write for literature and prices. ROBIN JONES PHOSPHATE COMPANY, 572 Bennie Dillon Building, Nashville, Tennessee. 20-*

LUMBER

Guaranteed lumber and shingles sold direct. Big saving! Ask for estimate. KENWAY LUMBER COMPANY, Tacoma, Washington. 15-7

FARMS FOR SALE

The Dairyman in the Ozark region of Southern Missouri and Northern Arkansas operates with 9 or 10 month's open grazing on clean rolling pastures—pure fresh streams of mountain spring water—fine grained clay soil producing a wealth of grass. Mild and healthful climate, average winter temperature 41.6, average summer temperature 78.9. Proximity to the great markets of St. Louis, Kansas City and Memphis makes quick delivery and good prices. Prosperous growing communities, good schools and fine hard surfaced roads. Land can still be bought or farms rented at reasonable prices, insuring good profits for the dairyman. Write for more information about this land of great opportunity. FRISCO RAILWAY, 879 Frisco Bldg., St. Louis, Missouri. 20-Spl

100 Acres, 17 cattle, crops, etc. Handy city of 200,000. The kind of farm so many people wish they had, fertile fields for high-paying crops, estimated 2000 cords firewood, sugar grove and fruit, amply watered pastures; good 9-room white home, 70 ft. barn with silo, milk, hen houses, hog house 18x40, granary, etc; convenient advantages, pleasant motor trip big city markets. Low price $5500, less than buildings' value, includes everything if taken soon, horses, 9 cows, young stock, registered bull, lot hay, oats, potatoes, etc. for winter and all needed implements and tools; part cash. Detail page 11 illustrated fall bargain catalog. Free. STROUT AGENCY, 255-DL, 4th Ave., New York City.

We Want More Factory Patrons. Mason County, Mich., admirably adapted to dairying, offers many inducements to new settlers. Low priced farms are still available. The largest cheese factory in the State is located in this county. Operating twelve months in the year, it provides an outlet for your milk at remunerative prices. Investigate the possibilities of this county before locating elsewhere. We have no land for sale but will be glad to assist prospective buyers in finding satisfactory locations. For further information, write to Dept. A, KRAFT CHEESE CO., Scottville, Mich. 18-4

For Sale—Good 160 acre dairy farm 4½ miles N. W. of Adams, Mower Co., Minnesota. 10 room house, barn 30x80, milk house, De Laval milker, 30 head high grade Guernsey cows, 14 yearling heifers, 1 registered bull. Other necessary buildings, equipment and feed. Address ROBERT JACKSON, R. 2, Adams, Minn. 20-2

Dairying Opportunities—Bargain priced farms in Minnesota, North Dakota, Montana, Idaho, Washington and Oregon suitable for intensive dairying from standpoint markets, climate and feed crops. Free literature and settlement service. Write mentioning state. H. W. BYERLY, 117 Northern Pacific Railway, St. Paul, Minn. 19-4

Position Wanted—Herdsman, years of expe modern dairy. Single, American, middle aged. full charge business. FRANK ALLEN, Intervill

Married man seeks position on route; Guernse preferred. Address BOX 551, care Hoard's Dair

Using Farm Periodicals

HOARD'S DAIRYMAN:—Farm pa- and women's periodicals are of d importance for keeping ample rmation "on tap" when they are tly used. Right use does not n merely a "once over" or even e articles carefully read and then wn away or piled away and usu- not touched until house cleaning noving day. My 16½ years of hing and county agent experience taught me to value papers, peri- als, and magazines containing erial needed for teaching and for nsion work.

armers and farm women have on y occasions emphasized to me the ssness of their stored away farm women's periodicals because they r can find what they noticed or hurriedly when these periodicals were new. I have heard vocational agricultural teachers complain that they lacked library advantages, when in their own community could be found many of the best current and stored-away farm and women's periodicals.

There are a number of ways of saving and organizing this material. It must be organized to be of value. Some periodicals supply an annual index for subscribers who might want to save papers for binding. It is a pretty safe guess that little of this indexing is done and less yet of material bound in this way is used. A good friend—a professor of rural education—told me recently that he had saved some of his farm papers in this way until he found the accumulation getting too voluminous. As a county agent I knew a fruit man who kept a scrap book of information clipped from fruit and other periodicals. Fortunately for his scrap-book plan, it was only information on disease and pest control that he wanted and so did not accumulate so much but what his scrap-book was very usable. I have tried ways of keeping loose clippings so they could be passed out to my students and others interested. These clippings were classified and readily available, but they were soon lost or worn out from the rough use they received.

It was not until my more recent experience as a county agent that I hit upon the plan I now use. These clippings must be easily referred to, they must be protected from wear by an inexpensive cover, and in convenient form. I found it just as easy to carry with me in my work 10 or 15 of these clippings as one ordinary sized bulletin. At the office there were frequent occasions for referring to them. Often the information desired was in more usable form than that in bulletins. Some of these clipping folders were loaned to domestic science and agricultural teachers and to farm women's home economics clubs. One of these clubs made an excellent start of their own library of clippings in folders. They took time at their club meetings for collecting and organizing this material. I have also loaned these clipping folders to farmers who wrote in for information that could not be as well supplied by bulletins or by letter. These clipping folders were also used as a source for my authority on subjects that I was called upon for talks at farmers' or farm women's meetings. In some cases they formed the basis for discussion. One winter I held a series of meetings in which I combined discussions on legume forage for the dairy, on soil management, and on farm management in which a number of the splendid series of articles, Efficient Feeding of Economic Crops, which ran in Hoard's Dairyman, filled an important place for the basis of discussion on two serious problems in the communities where the meetings were held.

Farm papers accumulate rapidly in a county agent's office. They have to be thrown or stored away. Before doing this I would always go through them and clip what I wanted. At a later time these clippings would be put in folders either with strips of adhesive tape, *passe parteau*, or directly with paste. The folders may be made of heavy wrapping paper on light cardboard cut in sheets 9 by 12 inches. When folded these are the same size as bulletins and can be filed with them.

My folders each had a main heading such as Dairy Feeding, Turkey Raising, Room Improvement, Farm Fun, Fairs, Floriculture, Nutrition, Inspirational, Hints for the Home, etc. In each of these folders I would attach clippings on the subject. The number of clippings would vary with their size. It isn't necessary to crowd them too close. Below the main heading, I have as a sub-heading the title of the clipping.

When one folder was full I began another. This would be marked as, for example, I. Turkey Raising, II. Turkey Raising. Incidentally, these clippings on turkey raising gave me more help for the turkey raisers of the county than I could obtain elsewhere.

New York. H. J. LECHNER.

Ravine Farm Jersey Sale

The first annual sale of Ravine Farm Jerseys held Oct. 8 at Prairie View, Ill., was a successful one. The cattle were in first class sale condition and all arrangements necessary for a well managed sale had been made.

Fifty-two head were sold for $8,155, an average of $157, with $400 the top price. C. Paschen, Illinois, paid this for a very good 3-year-old Raleigh heifer. Mr. Paschen was the heaviest buyer taking 23 head for $3,825. Mr. Astroth, American Jersey Cattle Club fieldman, buying for shipment to the Louisiana flood area, purchased 17 head for $2,375.

Walter Andrews did the selling and Sale Mgr. A. F. Block was in the box.

Below is given the average price for cattle of the different age classes: seven bulls averaged $142; 22 heifers under 2 years averaged $134; 14 two-year-olds averaged $182; 2 three-year-olds averaged $162; 7 cows 4 years old or over averaged $191.

South Dakota Creamery Course

The Dairy Department of South Dakota State College is offering the Creamery Short Course as usual. The course begins Jan. 5, 1928, and ends on March 22, 1928. Courses will be offered in ice cream, butter, and cheese. In addition, several supplementary courses will be required of the students. For further information write Professor Thomas M. Olson, Brookings, S. D.

Uncle Ab says it certainly is heartening to travel with a man who manages to speak well of his fellows.

Dr. DAVID ROBERTS

BLOOD-TONIK

Help Your Cattle to Resist Disease

Agricultural colleges, experiment stations and veterinarians everywhere concede that common breeding ailments of cattle, such as slinking calves, barrenness, failure to clean, goitre, and scours in calves are incident to a germ disease.

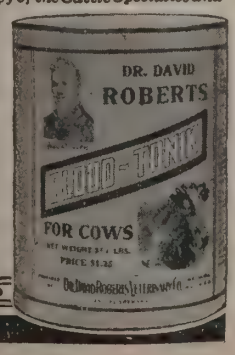
Modern Methods

of breeding, feeding and forcing for milk and butter production are practiced at a sacrifice of breeding vitality. Cattle are more susceptible to infection and the germs of disease and such diseases as Tuberculosis and Contagious Abortion more easily develop.

Prevention Better Than a Cure

It is easier and cheaper

If your cattle are subject to any of these common breeding ailments and are not doing their best, it is because there is something lacking. It is now possible for you to overcome these ailments. You can build up the breeding vitality of your herd. You can make your cattle less liable to infection. Dr. David Roberts'



BLOOD-TONIK

is especially prepared to restore the breeding vitality of cattle. Use it regularly and you will note the improved condition of your herd in the increasing number and quality of calves as well as in the quality and quantity of your milk supply.

If your dealer does not have it in stock, order direct. Price postpaid.

3¾ lb. pkg.	**$ 1.25**

Keeping Cows FIT!

Double Value because there's NO FILLER!

A calf and six thousand pounds of milk a year is a strain for *any* cow—whatever her breed or grade. And 100% of your investment depends on the milk and the calf.

Most dairymen find it pays to keep cows toned up with Pratts Cow Tonic. It's a combination of rare *natural* herbs and medicines that act directly on the reproducing organs and keeps them strong.

Prevents abortions and retained placenta. Cheaper to use because it's all tonic. No filler!

For caked udder and sore teats there's nothing as handy and convenient as Pratts Bag Ointment IN TUBES!

PRATT FOOD CO. Philadelphia, Pa.

Cow Tonic

55 years of success and fair dealing behind the Pratt guarantee. See your dealer for a money-back trial of any Pratt remedy.

Dairy Cattle Congress

(Continued from page 991)

Vronicka's College Boy. Junior champion bull—Suydam's Nero.

Senior and grand champion cow—June's College Girl. Junior champion cow—Maiden of Meadow Green.

The Ayrshires

Judge: L. V. Wilson, Minnesota.

Coming directly to Waterloo from the Eastern States Exposition where the Ayrshire show was unusually good, made the Dairy Cattle Congress exhibit of red and whites seem just an ordinary showing. There were less than 90 head here, most of them from four midwest herds.

In the aged bull class the contest was between Cavalier's Bobbie Vernon and Cavalier's Ping Pong, paternal brothers from the Seitz herd. Each has been a winner over the other, Ping Pong rating top most often perhaps, but he does not have the depth of body nor the balance of rear quarters and Judge Wilson put Bobbie Vernon number one.

A son of Ping Pong, shown by Wm. Wangen of Minnesota, topped the three-year-olds and Cavalier Fox Trot, owned by Fairfield Farm, was the best two-year-old.

The two-year-old has beaten Bobbie Vernon this year but he didn't look good enough to do it at Waterloo. He lacks the stretch and depth of the older bull that was senior and grand champion.

Cavalier's Fashion Model, Seitz's winning calf, was junior champion.

Cacapon Lass, Fairfield's Farms, grand champion female at the 1926 Cattle Congress, was first prize aged cow but she isn't the close springer showing in bloom like she did a year ago. She has better breed type than Cairncroft Primrose, the winning 4-year-old from the same herd, but she does not have the quality nor did she look to be so much of a dairy cow on judging day, and the heifer went up in the competition for senior championship.

The junior champion Ayrshire, Cavalier's Lady Lola, a senior yearling owned by Seitz, is a very good representative of her breed that promises to become a good cow but the Fairfield 4-year-old was already a very satisfactory cow on show day and the judge gave her due credit for that in placing her grand champion.

Watch any Ayrshire get of sire class where the Seitz herd is shown and you'll be pretty sure to see one by Cavalier's Lord Roseberry at or very near the top. There were two of them at Waterloo—one first, the other third.

The awards follow:

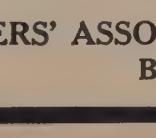
Bull 4 years or over—1 and 2, Adam Seitz & Sons on Cavalier's Bobbie Vernon and Cavalier's Ping Pong; 3, J. J. Lynes & Sons on Lynes' Choice of Penshurst. Bull 3 years, under 4—1, Wm. Wangen on Cavalier's Glenside; 2, Fairfield Farm on Fairfield Mandarin. Bull 2 years, under 3—1, Fairfield on Cavalier Fox Trot; 2 and 3, Seitz on Cavalier's Bondsman and Cavalier's Scotchmaster.

Cow 5 years or over—1, Fairfield on Cacapon Lass; 2 and 3, Wangen on Cavalier's Daisy and Dandy Boy's Meadowmaid. Cow 4 years, under 5—1, Fairfield on Cairncroft Primrose; 2 and 3, Seitz on Cavalier's Celia Louisa and Cavalier's Silver Actress 3rd. Cow 3 years under 4—1, Wangen on Cavalier's Calla Lilly; 2, Seitz on Cavalier Miss Roma; 3, Fairfield on Pearlstone Princess Jean. Heifer 2 years, under 3—1 and 2, Seitz on Milkmaid of Montdale and Cavalier's Peg in the Ring; 3, Fairfield on High Values Brownie.

Young Herd—1 and 2, Seitz; 3, Wangen. Get of Sire—1 and 3, Seitz on get of Cavalier's Lord Roseberry and 2 on Cavalier's Cupbearer; 4, Wangen on get of Cavalier's Ping Pong; 5, Fairfield on get of Alta Crest High Value. Produce of Dam—1, 2, and 3, Seitz. Dairy Herd—1, Fairfield; 2, Wangen; 3, Alta Crest.

Senior and grand champion bull—Cavalier's Bobby Vernon. Junior champion bull—Cavalier's Fashion Model.

Senior and grand champion cow—Cairncroft Primrose. Junior champion cow—Cavalier's Lady Lola.



AYRSHIRES

PROFITABLE — PRACTICAL

AYRSHIRES for Steady Production

It's that steady production everywhere, under all conditions that is making the Ayrshire the most popular dairy breed. Ayrshire breeders have long known that profits come from cattle that keep everlastingly producing milk that tests four per cent. Herd records prove that these breeders have developed cattle that lead in high average production.

Ayrshires are built for service. Their rugged bodies and perfect udders wear like iron and keep them working to a ripe old age.

Your profits may be increased by the use of an Ayrshire bull, or the selection of a few females.

Write for booklets or assistance in locating foundation stock

Jersey Bull Calves

We are offering at reasonable prices a few bull calves sired by Vive La France's Darlin and out of cows of rich Sophie's Tormentor breeding. Vive La France's Darling Son is Vive La France, the first cow to make over 1000 lbs. fat and the cow whose average of 89 butterfat for first 6 lactation periods exceeds that of any other dairy cow. He is sir Darling's Gallant Boy, the silver medal sire and full brother to Darling Jolly Lassie, 114 fat as Jr. four-year-old. Two of these bull calves are out of granddaughters of Sophie's the first Jersey cow to make 1000 lbs. butterfat.

His First 20 A. R. Daughters average—434.7 lbs. fat 8989.11 lbs. milk

— at av. age of 3.15 years

— Regular Herd Rations and Care

— Twice-a-day Milking

ANTON'S KING CONFIDENCE—43517 A. R.
Photo taken when two years of age.

SIRE—Anton's May King, sold for $7000.00. **DAM**—Ma Chere Confidence who has a two year old record of 511.82 lbs. butterfat and a junior four year old record of 764 lbs. butterfat. Ma Chere Confidence is one of the outstanding daughters of the famous Jardinier's Masher. A. K. C. sires excellent udders, long deep bodies, straight top lines, and real production.

You can buy bull calves out of his daughters and sired by outstanding bulls, from us very reasonably. Do not write us if you want a serviceable bull. Our males are always sold before they are old enough for service. Buy a young calf, raise it yourself, and save money. We have several nice ones on hand now — and they are priced to sell.

HERD ACCREDITED

Hoard's Dairyman Farm, Fort Atkinson, Wis.

Cow Testing Testimony

A good place to find out what cow testing association work does for owners of cows is right out on the farms where such cows are kept. Herman Chrispell of Michigan added his appraisal of the work while seated on the seat of a disc in a field he was preparing for corn when he said:

"At the end of the first month, March, 1926, I had 6 cows that brought me $11.50 less than their feed cost for the month. Just a year from that time, March, 1927, my cows brought me $2.06 for each dollar's worth of feed eaten for the previous month."

Evidence like this gives herd owners confidence in good cows. Where there is confidence in one's knowledge of cow feeding and management there is progress.

GUERNSEYS

The Place to Buy Breed Improving Guernsey Sires

is where that kind is bred. Visit our herd of Foremost Guernseys, or write for facts which prove we are breeding the kind of bulls that will increase production, improve type, vigor and reproducing ability.

The dams of our six herd bulls average 13,797 lbs. milk, 729 lbs. fat. Twenty-eight calves dropped since August 1st. Twenty-one cows due to calve before December 1st.

We need room. Your opportunity to buy bulls or bull calves below value.

U. S. National Fall Sale

NOV. 15-16 WAUKESHA, WIS. | NOV. 17-18 WATERTOWN, WIS.

300 HEAD

America's BEST Holsteins

On this page we show pictures of just a few of the good ones. These pictures do not begin to tell the story of this great sale. These are cows, heifers and bulls that have been hand-picked from good clean herds all over the country, a large percentage of them from ACCREDITED HERDS and the balance from herds under state and federal supervision.

FALL AND WINTER MILKERS—

We have been over Wisconsin and other nearby states with a fine-tooth comb, selecting fresh cows and springers of desirable type and evident producing ability, many with large C. T. A. records, others with A. R. records and still others that are just great prospects. **These females will pay you immediate returns at the pail and at the same time will serve as foundation stock for the building up of a high class purebred herd.**

THE BULLS—There will be 60 bulls of superior breeding and individuality. THE YEAR'S GREATEST SELECTION OF BULLS

30 of them from dams with records of 30 lbs. of butter in 7 days or with butter records the equivalent of from 900 to 1327 lbs. in a year. 30 bulls of superior type selected because of combined type, records and breeding. We have used especial care in selecting our bulls for type, breeding and promise many will bring top prices from the big breeders but there will undoubtedly be a number of desirable ones that will go at prices any good dairy farmer can well afford, or several can pool their resources and get one of the tops. **Here is an opportunity for county agents and others interested in forming bull associations.**

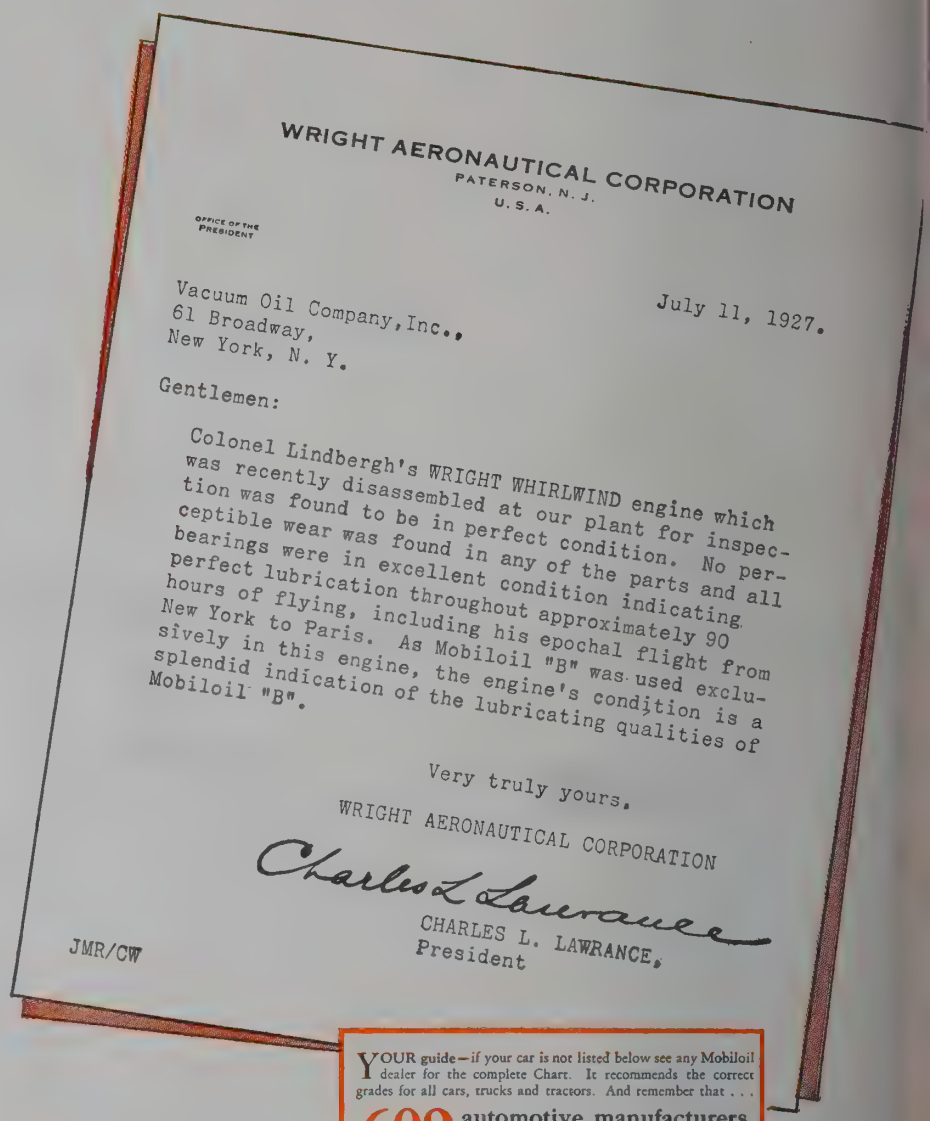
Wright engineers examine Lindbergh's engine!

What their findings tell you about lubrication

In a few days of actual flying Col. Lindbergh's engine did harder work than your car or tractor will probably do in the next 6 months.

In these flights his engine usually ran with wide-open throttle under a heavy load, much as your tractor engine operates. But the load was many times greater than your tractor ever carries.

And on his famous New York to Paris flight his engine ran without stopping for 33⅓ hours, where your tractor seldom runs continuously more than 6 or 8 hours.



Shortly before Col. Lindbergh took off again for his nation-wide tour of this country, the Wright Aeronautical Corporation examined his engine.

The letter at the right explains their findings.

Col. Lindbergh uses our regular stock Mobiloil "B" — the same oil that is recommended for many farm tractors. The grade recommended for the Fordson and many others is Mobiloil "BB" which is made from the same stocks but is somewhat lighter in body. A nearby Mobiloil dealer has these oils. His Mobiloil Chart will tell you exactly which grade of Mobiloil to use in each of your engines.

The best way to buy Mobiloil is in 30- and 55-gallon steel drums with faucets. Your dealer will give you a substantial discount on these quantity purchases. He also has the 10-gallon drum with faucet and the 5-gallon tipper box.

Mobiloil may cost you a little more by the gallon but it is cheaper in the long run. Let Mobiloil banish wear in all your automotive engines just as it did in Col. Lindbergh's engine.

WRIGHT AERONAUTICAL CORPORATION
PATERSON, N. J.
U. S. A.

OFFICE OF THE PRESIDENT

Vacuum Oil Company, Inc.,
61 Broadway,
New York, N. Y.

July 11, 1927.

Gentlemen:

Colonel Lindbergh's WRIGHT WHIRLWIND engine which was recently disassembled at our plant for inspection was found to be in perfect condition. No perceptible wear was found in any of the parts and all bearings were in excellent condition indicating perfect lubrication throughout approximately 90 hours of flying, including his epochal flight from New York to Paris. As Mobiloil "B" was used exclusively in this engine, the engine's condition is a splendid indication of the lubricating qualities of Mobiloil "B".

Very truly yours,
WRIGHT AERONAUTICAL CORPORATION
Charles L. Lawrance
CHARLES L. LAWRANCE,
President

JMR/CW

YOUR guide—if your car is not listed below see any Mobiloil dealer for the complete Chart. It recommends the correct grades for all cars, trucks and tractors. And remember that . . .

609 automotive manufacturers approve it!

The grades of Gargoyle Mobiloil, indicated below, are Mobiloil "E," Mobiloil Arctic ("Arc."), Mobiloil "A," Mobiloil "BB," and Mobiloil "B."

Follow winter recommendations when temperatures from 32° F (freezing) to 0° F (zero) prevail. Below zero use Gargoyle Mobiloil Arctic (except Ford Cars, use Gargoyle Mobiloil "E").

Volume 72, No. 21 Fort Atkinson, Wisconsin November 10, 1927

At Nebraska "Ag"... In Pennsylvania... And o a Vermont Dairy Farm ... *They tell hou they always have*

WARM, DRY FEET

HERE are real people telling you in their own words why they buy Ball-Band (Red Ball) footwear.

They say they like footwear with the Red Ball trade-mark because it gives them more days wear, because it gives them perfect foot protection in wet and cold weather, and because Ball-Band footwear fits.

For more than two generations, millions of other men like them have worn Ball-Band footwear; and everywhere you go, they say the same good things about it.

If you are not already wearing footwear with the Red Ball trade-mark begin at once to do so. Then you will know what these farmers mean when they talk about foot protection, good fit and more days wear.

Ask your dealer for Ball-Band. Every genuine Ball-Band article has the Red Ball trade-mark. Look for it.

MISHAWAKA RUBBER & WOOLEN MFG. CO.
313 Water Street, Mishawaka, Indiana

"I like the way they fit"

"I can't remember when I bought my first pair of Ball-Band footwear, it has been so long ago," says Mr. S. W. Perin, Farm Superintendent of the Nebraska College of Agriculture at Lincoln.

Mr. Perin has been in the service of the University since 1889, and has "set the stage" for farm laboratory experiments for tens of thousands of students. Dipping, fertilizing, butchering, feeding, he has to come and go in all sorts of weather. Through wet grass, mud and manure, and over cinder drives and concrete floors, without heed as to where he steps. Yet, he says:

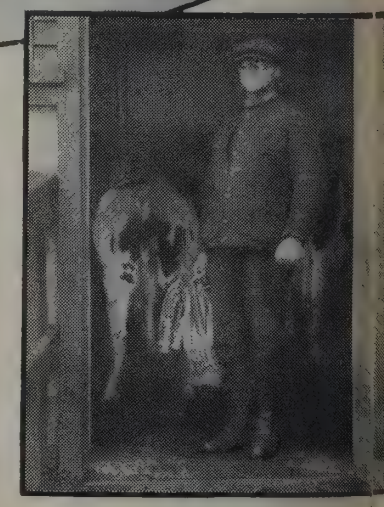
"I've never had a defective pair of Ball-Band footwear in my life. Every boot or rubber with the Red Ball trade-mark I've owned has given me all the wear I could possibly ask. I also like the way Ball-Band footwear fits. Comfortable feet are as important as warm, dry feet.

"Most of the boys who work under me here wear Ball-Band too, and the wear that some of them give their boots is a real test of durability."

"We got the habit from Dad"

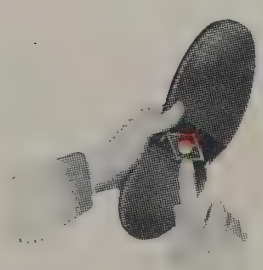
Seventy-five years ago the Greiner farm near East Syracuse, New York, was a forest. Today, it is one of the best farms in the Onondaga Valley and Earnest Greiner and his brothers are certainly among the busiest farmers in the Valley. They have built up a milk route, selling around 350 quarts daily, of which about half is produced by their own herd of 14 Holstein cows.

Go into the Greiner kitchen and you will see an array of Ball-Band rubbers of all kinds that looks like the stock of a small store, for all the boys wear them. There are knit gaiters, sanslips, four-buckle arctics, and half-hip boots.



"We've been wearing Ball-Band goods right along," says Earnest Greiner; "I guess we got the habit from Dad. Believe me, we *wear* them too, because peddling milk and looking after a herd of cows is mostly footwork. We can't pick out easy paths to save our feet, and we don't have to with Red Ball footwear."

"The best riggin' in the state"



According to D. J. Stebbins (photograph on the right), Manager of the 2600-acre Brattleboro Retreat Farm, "the Ball-Band four-buckle cloth arctic is without question the best riggin' in the state for the kind of work we do around here. It keeps out the wet of even deep slush and is perfectly warm in below-zero weather. I've worn a single pair more than a year. Other kinds won't last me near that long."

The kind of work that Mr. Stebbins does is familiar to every dairyman, only not many farms are as large or as well stocked as Brattleboro Retreat. He superintends about thirty-five men, who work the farm and take care of 140 head of cattle (mostly Holstein cows), 200 head of hogs and 20 horses.

This knee boot and rubber arctic are two popular styles from the large Ball-Band line. First quality materials and honest workmanship build amazing long life into every article that has the Red Ball trade-mark.

Look for the Red Ball

Leather work shoes as well as rubber footwear can now be bought with the Red Ball trade-mark. They, too, give more days wear. Ask your dealer to fit you with Mishko shoes.

Wayside Musings

The Permanent And Abiding

JOSEPH S. MORRIS, WISCONSIN

Isaiah 40:28 "Hast thou not known? Hast thou not heard? The everlasting God, Jehovah, the Creator of the ends of the earth, fainteth not, neither is weary; there is no searching of His understanding."

The second stanza of one of the great old hymns runs thus:

"Swift to its close ebbs out
life's little day;
Earth's joys grow dim, its
glories fade away;
Change and decay in all
around I see;
O Thou who changest not,
abide with me."

WE have not lived very long until there begins to burn into our consciousness the idea that the life of man is a transient life and that the world is constantly changing.

Beset with the thought of our human limitations and imperfections we turn in the direction of religion to see what it has to offer, or, we make up our minds that "since nothing lasts anyway we may as well have a good time and forget all serious concerns." But it is not true that the thought always challenges us, the thought that somehow, here, in the midst of it all, there is Something, Somewhat, Someone that "fainteth not, neither is weary?"

Life is never easy to live. There are difficult tasks, hard problems, burdens to be borne. We do not wish it otherwise, not when we think it through. Friendship leads to strength of body; problems sharpen the mind; burdens call up the divine within us.

It is probably true that we should never boast to our children about how much we do for them, and yet is there not some sense in which they may well understand that without years of painful toil and willing sacrifice they could not have the lives of well-being which they do have? I am committed to the idea that we should "talk things over" with our boys and girls, so that they may really come to know the problems of fathers and mothers.

There is a twofold value in the suggestion: Our boys and girls come to understand us, and we have the opportunity of keeping in touch with the changing thought of the world.

Is it not true that just at the moment we think things have settled down into a condition of permanence we are jarred by changes? Would we have it otherwise? Changes that lead to positive betterment are valuable and we should welcome them, but we must steer clear of too frequent and not well-thought-out changes. Restlessness that results in constant change is costly and demoralizing. Men over whom hangs the spectre of constant change are not likely to give their best to the work of life.

Is not our quest, then, to find in the midst of the constantly changing that which brings the comfort of permanence? Dr. Rudolf Eucken tells us that "Religion is an inner identification with God and the creation of a new life through it." And the process is endless. I have observed among men and women that even though their faiths may differ, yet there is never any failure when they are making full use of what they believe in the building of an ever new, rich, and full life. God bless them for the fruitage of their faith.

During the lifetime of many of us there have come changes that have well-nigh revolutionized life: the electric street car, the automobile, farm machinery, the airplane, and the end is not yet. More and more will we see genius directed to the creation of machinery that will take away the burden of back-breaking toil and release us to the development of finer and nobler lives if we use our opportunities in sane and wise ways.

People will tell you that changes have been rapid everywhere but in religion. They think that is a thoroughly valid criticism. But is it? Is it not religion's noble purpose to comfort the heart of man, in the midst of his swiftly changing life, with the comfort of the unchangeable and eternal? What change may we expect in religion except that which comes through man's moving up to a fuller understanding of the unchangeable and eternal?

What we want is the feel of something that is everlasting, something that a man may tie to in the midst of a world-life in which we are forever conscious of ceaseless movement and change. Make full use, therefore, of all the agencies available for building in us a sense of the nearness of the Everlasting God.

Let not religion be a matter of quarreling about something; let it be a matter of believing something so steadfastly that we come to live in the permanent and the abiding.

The schoolmaster wrote on the back of a boy's monthly report: "A good worker, but talks too much." The father signed the report and then wrote under the remark of the schoolmaster: "You should meet his mother."

JERSEYS FOR THE FLOODED AREA

In recognition of the heroic courage and determination of the dairymen of Louisiana to rehabilitate themselves and build anew, members of the American Jersey Cattle Club have donated two carloads of high quality registered stock to these flood sufferers. The photograph shows some of the young stock assembled and shipped from Philadelphia. The Louisiana Dairy Association and the Red Cross Society co-operated in transporting and distributing the cattle. The shipment contained representatives of many of the most distinguished Jersey families.—The American Jersey Cattle Club.

Cows, hogs, poultry,—outdoors *all winter! in California*

IF you come to California this winter you will see poultry ranches with thousands of hens out of doors in the warm sunshine, and an acre or two of flourishing kale alongside. We'll show you in midwinter, in the Great Valley, fine dairy herds grazing on the sixth or seventh crop of alfalfa, and hogs running free in the thick orchard cover-crops.

An all-year growing climate, with some kind of crop growing or ripening every month in the year, is one of the chief reasons for California's $700,000,000 annual production in agriculture.

And it is one of the reasons why California cows produce, on the average, more butterfat per cow than any other state. But the reason why California dairymen get an average of 20% more for the butterfat they produce so plentifully is simply that there are not enough all 'round farmers in California to serve the growing population of our cities. We need more good farmers, with enough capital for a fair start. We have to go to other states every year to buy 22,000,000 pounds of butter to meet the shortage and for the same reason we need four times as many hogs as we are raising ourselves, besides enough more poultry to keep us from buying chickens by the carload from the middle-west. California prices are high enough to cover middle-western prices and the freight besides.

The frostless belt of California's Great Valley continues for two hundred miles north of San Francisco. There you can see the earliest of oranges being gathered for Thanksgiving prices; olives worth a cent apiece at the packing house and not enough to go around; irrigated cotton that yields twice as heavily per acre as the national average and sells at a premium of 3 to 5 cents for quality. Peaches, pears and other fruits that you buy in a can or carton grow by the hundred-million-dollars-worth in California's Great Valley and the smaller valleys on either side—part of the crop that makes California the third greatest agricultural state in America.

Anywhere in the Great Valley, along the coast or in the hills, you can be almost sure of finding the pleasant California home and the farming opportunity you are looking for. There are good roads everywhere—55,000 miles in all, and 8,000 paved. Electricity is plentiful, and cheap. The mountains, the ocean and the big cities of San Francisco Bay, where a million people live, are but a short drive away. Your children will go to the finest rural schools in America. For all the family, California is a place "where life is better."

There is a wealth of helpful information in this 84-page book, "Farming in California," to enable you to plan your trip. It is authoritative, dependable information, published only by Californians Inc., a non-profit organization of citizens and business firms who are helping in the rapid development of their state. This coupon will bring you the book, prepaid. Send for your copy—today!

*R. F. D. or Street, City & State*_____

The splendid exhibit of the Ayrshire Breeders' Association attracted marked interest at many of this year's big shows. The Association selected the De Laval Milker to do the milking in this exhibit and a special glass pail was provided in order that the audience might see the milk flow. Large crowds witnessed every milking.

The New York State Guernsey Breeders' Ass'n. staged a most interesting exhibit which was a center of interest at the New York State Fair. In a model dairy barn erected on the grounds seven purebred Guernseys were kept and the milk sold to an appreciative audience. This Association also selected the De Laval Milker for its exhibit.

De Laval Milkers were at the Shows and Fairs with the Breeders and Breed Associations

VISITORS at many of the noted shows and fairs this season had an excellent opportunity of seeing for themselves the extent of the confidence that the various breed associations and the breeders themselves place in the De Laval Milker.

The Ayrshire Breeders' Association and the New York State Guernsey Breeders' Association each selected the De Laval Milker for use in splendid educational exhibits that evoked interest and commendation from all who saw them.

Prominent herds like the Munroholm Guernseys owned by Mr. Thomas Munro, Camillus, N. Y., and the Shelter Valley Holsteins owned by Messrs. R. M. and J. H. Stone at Marcellus, N. Y., were milked during their entire sojourn at the fair grounds with the De Laval Milker. The fact that prominent breeders place sufficient faith and confidence in the De Laval Milker to see to it that their valuable show herds have the advantage of De Laval milking even when away from home on the show circuit is extremely gratifying. It clearly demonstrates the point that wherever better milking and greater production are sought after the De Laval Milker is considered the only solution by those with whom these are such vital problems. And for the dairyman who produces a low bacteria count milk, the De Laval Milker has a combination of sanitary features that are undefeatable.

Write to the nearest office for complete information, or if you prefer ask to have a De Laval representative call at your home.

Above: *The splendid Guernsey show herd of the Munroholm Farm, owned by Mr. Thos. Munro at Camillus, N. Y., at the New York State Fair, where they were milked with the De Laval Milker as in the home barn.* Right: *Part of the noted purebred Jersey herd kept at Ashland Farm, Chattanooga, Tenn. This herd is said to be one of the finest in the South and captures prizes wherever it goes. Mr. J. O. Key, manager, says that the De Laval Milker is a great aid in making maximum production.*

Another renowned herd that was made to feel at home with the De Laval Milker at the New York State Fair was the Shelter Valley Holstein show herd. This herd, which is owned by Messrs. R. M. and J. H. Stone of Marcellus, N. Y., received much attention from Holstein fanciers and fanciers of fine cattle in general. To their credit it may be said that this interest was not confined to the audience alone for the judges saw fit to permit individuals of the herd to carry home several valued awards.

Barley Compared To Corn For Dairy Cows

O. E. REED, MICHIGAN

ARLEY has been fed to dairy cattle as well as to other classes of live stock for many years and l results have been reported. A nt trial in which barley was com- d to corn as a feed for dairy cows just been reported by the Michigan eriment Station. The principal on for making this trial was to in further information that could tantiate recommendations which now being made to dairymen in area infested with corn borer in nigan. In the eastern and south-

Composition of Barley and Corn

	Dry matter in 100 lbs.	Dig. nutrients in 100 lbs. Crude protein	Carbohydrates	Fat	Total
y	90.7	9.0	66.8	1.6	79.4
	89.5	7.5	67.5	4.6	85.7

ern section of Michigan the corn r has been gaining a foothold for past three years. It is a well wn fact that corn can be grown used for silage even in an infest- area, but the question of growing for grain presents a e difficult problem. Hence, e has been an increased and for information con- ing growing and using stitutes for corn in this n. A comparison of the entage composition of ey with corn, as shown with, indicates that bar- would not give quite as d results as corn in a ra- . However, the feeding l reported shows very lit- difference between the two ins in feeding for milk duction. Barley should be und or rolled before feed- it to cattle.

he experimental trials re- ted were conducted at the ege during the period in March 10 to June 8, 7. Ten cows, nine pure- d Holsteins and one Ayr- e, were selected from the ege dairy herd and divid- into two lots of five cows n. Care was taken to se- groups of cows that were parable as far as milk duction, stage of lacta- , age, and other factors t might influence the l.

ll cows were fed rough- at the rate of one pound hay and three pounds of ge for each hundred nds of live weight. Grain fed to the Holsteins at rate of one pound to e and one-half pounds of k produced and to the rshire at the rate of one nd of grain to each three nds of milk produced. The s were weighed each day he same time. Changes in ounts of grain and rough- age fed were made at the end of ten-day periods. The cows were fed alfalfa hay of good quality and well matured corn silage throughout the trial. The corn grain ration consisted of 400 lbs. ground corn, 300 lbs. ground oats, 200 lbs. bran, and 100 lbs. Old Process linseed meal. The barley grain ration was the same except that ground barley was substituted for the ground corn.

During the first thirty days of the trial, Lot I was fed the corn ration and Lot II was fed the barley ration. During the second thirty days Lot I was fed the barley ration and Lot II the corn ration. During the third thirty-day period Lot I was returned to the corn ration and Lot II to the barley ration. The first ten days of each period were regarded as a transition period and not included in the final results.

Since cows tend to decrease in their milk production as lactation advances and since this is a fairly uniform factor, the average production of each lot of cows during the first and third periods should equal the production of the same cows during the second period if there is no change in production due to change in feeding.

Lot I—5 Cows—Twenty-day Period

Period	Milk	Fat	Body wt.
	Lbs.	Lbs.	Lbs.
1 Corn in grain ration	4,392.3	136.7	6,375
2 Barley in grain ration	3,993.1	123.2	6,370
3 Corn in grain ration	3,739.0	114.4	6,342
Average 1st and 3rd periods, corn ration	4,065.7	125.5	6,359
2nd period, barley ration	3,993.1	123.2	6,370
Difference in favor of corn	72.6	2.3	—11

Lot II—5 Cows—Twenty-day Period

1 Barley in grain ration	4,391.1	137.1	6,373
2 Corn in grain ration	4,055.1	120.7	6,359
3 Barley in grain ration	3,783.4	115.9	6,319
Average 1st and 3rd periods, barley ration	4,087.3	126.5	6,346
2nd period, corn ration	4,055.1	120.7	6,359
Diff. in favor barley ration	32.2	5.8	—13

The preceding table gives the results of the barley and corn feeding trials. A study of the data presented shows that the five cows in Lot I produced a total of 72.6 pounds milk and 2.3 pounds more butterfat during the average 20-day period when on the corn ration than they produced during the intervening 20-day period when on the barley ration. The average weight of the five cows, however, was 11 pounds greater during the 20 days they were on the barley ration. The five cows in Lot II produced a total of 32.2 pounds more milk and 5.8 pounds more butterfat during the average 20-day period when on the barley ration than they produced while on the corn ration. The average weight of the five cows in this lot, however, was 13 pounds greater during the 20 days they were on the corn ration.

Conclusion

The fact that the cows in Lot I produced more milk and butterfat on the ration containing corn and the cows in Lot II produced more milk and butterfat on the ration containing barley, it can be concluded that the two grain rations are about equal in feeding value and that barley may be substituted for corn in the grain ration of the dairy cow.

MEDICAL AID

"Sales by the Candle"

The London correspondent of the Christian Science Monitor reports the following interesting story concerning a type of auction sales:

"A recent book about the Baltic Exchange, the London center where grain is bought and sold, contains a passage about the age-old custom known as 'sales by the candle.' A number of writers have shown that timber was sold by this method in London as late as the middle of the last century and seem to assume that it afterward dropped out. As a matter of fact, sales of farming crops in the English midlands are still conducted in this way. Such a sale has just been recorded near Brackley, in Northamptonshire.

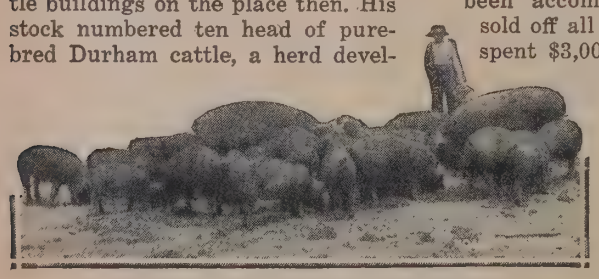
"The method of sale varies; in some cases a pin is stuck in a candle about an inch from the wick and the last bid before the pin is reached ends the sale. In other cases the candle is cut in inch lengths and each lot offered at auction is sold as the last flame splutters out. The method is one of the many treasured old customs which still survive in rural England."

Railroad Section Hand Becomes Successful Dairy Farmer

German Immigrant Turns from Railroading to Carve Farm from Forest

THE lure of the "promised land" brought 24-year-old Frank Barfknecht and his bride from Germany to Wisconsin. They landed the latter part of April, 1885, unable to speak English, and in possession of little except plenty of ambition and enthusiasm, and a ticket to Cameron, up in Barron County, Wisconsin. The ticket had been sent them by an uncle, Frank Spickerman, who was working for the Omaha Railroad.

For four months the young German toiled on the railroad section at Cameron. Then came a chance, through his brother-in-law, to move to Ladysmith in the next county to the east. While Frank Barfknecht worked on the railroad section there, his wife cooked to board the crew.



At the end of a year came a chance for promotion. A section foreman was needed. Frank applied. Although still not proficient in the English tongue, he had been a hard worker and had become very familiar with his section. He was highly educated in Latin before coming to this country, so could write English well. Having these qualifications, he was made section foreman.

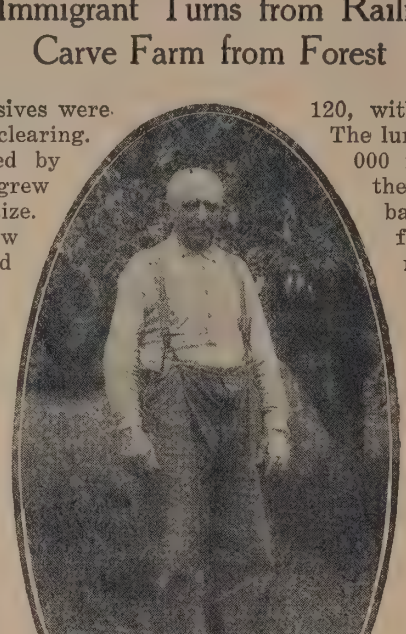
A Family Cow and Hoard's Dairyman

Fifteen years is a long time when you look ahead. But when you look back it diminishes considerably in size. This was the period that Frank served as section foreman, earning and saving. A home was the first goal; after that a couple of cows, some chickens, and some bees. Soon came Hoard's Dairyman. All the while Barfknecht was nurturing a hope—a dream that some day he might be a dairy farmer. And he was planning. Neighbors and friends called him "farm crazy." But he kept right on planning.

Then came his opportunity. A brother-in-law, Frank Glatz, had a farm about eight miles northwest of Barron. Across the way was a 160-acre tract of solid timber for sale at $5 an acre. Barfknecht gathered up his savings and purchased the land. Three years later he and his family moved there, bag and baggage.

There was a clearing with two little buildings on the place then. His stock numbered ten head of pure-bred Durham cattle, a herd developed from his two family cows at Ladysmith. It was necessary for him to borrow $500 with which to purchase a team, wagon, and sled.

MR. BARFKNECHT FEEDS HIS PIGS



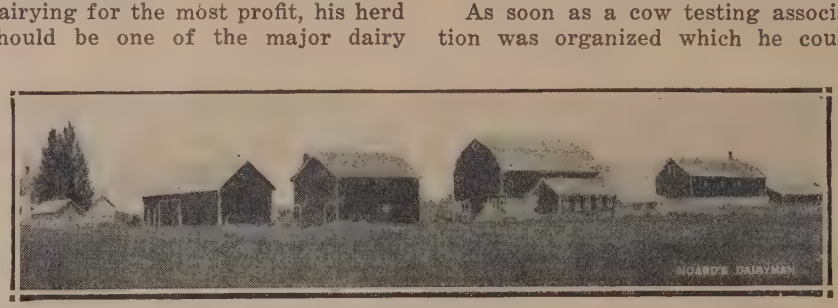
Three years later he purchased another 80 acres north of his property for $1900. This was borrowed money, but the timber on the acres paid for every cent of it. About five years after coming to this Barron farm, Barfknecht added an additional 80 acres at $50 per acre.

Clearing The Land

Barfknecht was a fiend for work. Land must be literally made if crops were to be grown. With the axe and saw Barfknecht hacked his farm from the forest. In the twenty-six years that Barfknecht has been working the farm he has logged off 140 acres, and cleared for cultivation 100 acres. In the early days stumps were grubbed out, but later, explosives were used to hasten land clearing.

As the years sped by Barfknecht's family grew in number and size. Four boys soon grew into manhood and they have assisted in developing this farm land. There were also four daughters in the family, one of whom is home now assisting her mother.

"There is an old saying that 'A sparrow raises another sparrow but a farmer does not raise another farmer,'" said Mr. Barfknecht, "but I have raised four farmers." Two of his boys are on the home farm. To each of the other two boys Mr. Barfknecht has given an 80-acre farm adjoining.



FRANK BARFKNECHT

While the first cattle on the Barfknecht farm were Durhams, it did not take Mr. Barfknecht many years to realize that if he were to follow dairying for the most profit, his herd should be one of the major dairy breeds. In 1910 he decided on Holsteins and purchased a pure-bred sire from Mr. Stevens of Jefferson, Wisconsin. The sire was crossed on the Durham cows and a high grade Holstein herd built up. When this had been accomplished, Mr. Barfknecht sold off all his grades for $4,000 and spent $3,000 purchasing eleven pure-bred females from Fred Krahenbull, a leading breeder in the locality.

As soon as the development of a high grade Holstein herd was well under way, Mr. Barfknecht discovered that his barn was inadequate to house such a herd as he hoped to own in the near future. So in 1912 he built a large barn, 40 by 120, with two inclosed silos. The lumber, more than 100,000 feet which went into the construction of the barn, came from the farm and consists mainly of pine, white oak, and elm.

Stanchions and pens of modern design and drinking cups were installed in the new barn. A feature of the interior arrangement is the row of individual calf pens which extends the full length of the barn. Mr. Barfknecht is satisfied that this system of housing calves is worth while. The calves cannot suck one another and can get more individual attention. The twin silos, located inside the barn at one end, offer the advantage that they may both be filled with but one setting of the machine.

CARVED FROM THE FOREST THE BARFKNECHT FARM IS A MONUMENT TO THE INDUSTRY OF ITS OWNER

Joins a Cow Testing Association

As soon as a cow testing association was organized which he could join, Mr. Barfknecht became a member. The herd average for 1925-26 was 301.8 lbs. fat for 24 cows. The high cow in the herd was Lady Pontiac Pearl Hartog, with a record of 546.9 lbs. fat. The herd averaged a profit above feed cost of about $100 a head in 1925. The herd sire is Pabst King Orchid. Shown at the Barron County Fair he has been awarded a championship ribbon.

The grain mixture fed the herd consists of 200 lbs. corn, 200 lbs. oats, 100 lbs. bran, 100 lbs. gluten, 50 lbs. oil meal fed with first quality alfalfa hay and plenty of corn silage. The cows get the right kinds and amounts of raw material with which to manufacture milk in abundance.

Feeding the Calves

"We feed the calves about 5 lbs. of whole milk a day," says Mr. Barfknecht. "The second two weeks increase the feed to about 7 lbs day, then they get half whole and half skimmilk for another weeks, getting about a gallon of mixture twice a day. We feed skimilk until the calves are a year The big calves get about two gall a day. All the calves have grain front of them. The mixture we f the older calves is made up of 50 oil meal, 100 lbs. ground oats, lbs. ground corn, 100 lbs. bran. T also get alfalfa hay and silage."

Fifteen acres of Irish Cob (early) potatoes make up the crop grown on the farm. A big in the barn is capable of hol 1,000 bushels for storage. In 1 Barfknecht made $3,500 on 12 a of potatoes. A 4-8-6 commer fertilizer is applied to the po ground at the rate of 500 lbs. to acre.

The other field crops grown about 20 acres of corn for silage. acres alfalfa, 10 acres clover, acres oats, 15 acres barley.

"We generally figure to spend al $1600 a year for purchasing fee says Mr. Barfknecht. "Corn is king of the country and I like to k my cows in good flesh."

Sources of Farm Income

The average yearly sale of cattl about $2,000 and a similar figure ers the annual receipts from the of hogs. A source of good profit the farm is the herd of about 60 pu bred hogs. The pigs get plenty skimmilk, ground oats and barley, alfalfa pasture. They are fatte for market on corn, and they also fed a mineral mixture of as and salt. Barfknecht aims to m ket his pigs in August and Febru at a weight of 200 lbs. each.

The farm flock consists of ab 200 laying birds of the White Le horn and Silver Wyandotte bre The income from poultry and e is over $300. The poultry house just been remodeled at a cost of p proximately $1000. It has a moc system of ventilation. It is equip with feeders, nests, fountains, electric lights.

The dairy herd is kept up to ab 60 head, with a milking string

TWO STALWARTS—THE HERD SI AND ONE OF MR. BARFKNECHT'S SONS

about 25. Milk is separated on farm and the cream goes to the Ir ron Co-operative Creamery.

Years of Accomplishment

At the age of 66 years Frank Bf knecht can look upon the fruit of i labors and be proud of his acc plishments. He has reared a fine f ily who have been loyal to him the farm. His farm has been car out of the forest and is produc him a neat income which might be the envy of many business m He has a set of farm buildings as practical and good looking as could wish. The original 160 a have increased in value from $800, which he paid, to $35,000, a conservative figure. The buildi alone are valued at $19,000. Fa ing has paid Mr. Barfknecht richl

THIS BIG BARN WAS BUILT FROM LUMBER CUT ON THE FARM

Hunter of Kewaunee

Traveling Westward to Cleveland—Call of the Wild—A Trying Year—Bear Hunt—Migration to Sauk County

RANSOM A. MOORE, WISCONSIN

N 1820, my grandfather married Sophia Bishop of Vermont. Both were 20 years old. They soon decided to migrate West. From bounty money received from killing panthers and working for others, his assets amounted to about $200, two fine horses, a fine rifle, some blankets, and wearing apparel.

RANSOM A. MOORE

With no real goal in view, they bade the near relatives good-bye, mounted their horses and rode westward. They camped where night overtook them, and came at last within sight of Lake Erie. The lake became their guiding star. They continued until, as they believed, they were in the far, far west. At a point where the beautiful Cuyahoga River empties into Lake Erie, they decided to set stakes.

Grandfather found employment in the little town of Cleveland. He soon became 21 years of age and staked out his government claim or homestead. He proved up on this claim which now lies near the center of the great city of Cleveland, and secured title about 1826. Here the family of nine children were born, attended district school, and helped on the farm.

The country settled up rapidly, which was not to grandfather's liking as the new settlers interfered with his hunting and trapping operations. He heard of the great hunting, fishing, and trapping in the newly formed territory of Wisconsin, and dreamed of the time he might wend his way through the mighty forests of that territory.

His brothers, Joseph and Levi, had already settled in Wisconsin, the former in Waupaca county and the latter at Waraboo. These brothers undoubtedly had written him of the wonderful hunting in this promising country.

In 1838 the call of the wild was so intense that he decided to go again westward, consequently sold his farm for the magnificent sum of $4,600, which at that time was considered one of the best sales of farm lands that had so far occurred in that region. At that time grandfather had two fine spans of horses and by arranging two covered wagons, together with equipment for the trip, the family were made as comfortable as possible and the long journey to a strange land was begun.

The roads were rough and muddy, so progress was retarded and only a limited number of miles could be made in a single day. Horse theft organizations flourished in those days and they were determined to get these two spans of fine horses. However, grandfather was not a man to be trifled with and his experience with firearms was such that the horse thieves were up against a man who could match them at every turn.

Emerging from the Maumee bottoms he came into the openings of Michigan, then Indiana, and finally rounding the head of the lake he came through the corner of Illinois and camped on the site where Chicago now stands.

Following the western shore of Lake Michigan, he crossed the Illinois line and emerged into the open hardwood forests of Wisconsin. These forests were not as dense as those farther north but were more like prairie openings. All breathed a sigh of relief when they found they were already several miles into Wisconsin territory.

Grandfather had no objective point and did not expect to go where his brothers were, but in some instinctive way he seemed to pick out a place that would be congenial for himself and family. His enthusiasm became almost unbounded at the solid trails of deer and now and then the big flat footprint of the bear.

Passing north of where Kenosha now stands, they soon came to a village known as Racine. All signs seemed right—fine lake frontage, game abundant, good water, and fine farm land. What more could a human mortal desire? The village of Racine was started in 1835, four years before the arrival of my grandfather. My grandfather found a village with a total population of 337 and in four years from that time, or in 1844, the population had increased 1100. It can be noted that Milwaukee, in 1840, had a population of 800. The population of entire Wisconsin was only 4,795 in 1834.

HOW GRANDFATHER TRAVELED FROM RACINE TO HIS HUNTING GROUNDS

In the fall, taking his traps, guns, and hounds, he sailed northward on Lake Michigan with his men in mackinaw boats.

GRANDFATHER AND HIS BRIDE TRAVELED WESTWARD TO CLEVELAND

Camping where night overtook them they came at last in sight of Lake Erie. Following the lake they finally set stakes near Cleveland

The first Anglo-Saxon family settled in Milwaukee in 1835 and the first white child was born to Mr. Wriel Smith in this year and was promptly named Milwaukee Smith. The first hotel, "Milwaukee House," was completed in 1837; also in 1837 Michigan was admitted as a state and Wisconsin left as a territory. First child of German parentage was born to Louis Blyer in 1838.

In 1840 a bridge was put across the Milwaukee River. I mention these few facts to show that both Racine and Milwaukee were in their infancy at the time my grandfather came to Racine.

He bought a few acres of land in the village and erected a little home for the family with the view of doing some teaming in the village while he looked over the country. He was so pleased with the general outlook that he purchased two tracts of land, one heavily timbered at "the Point," a place north of Racine, and the other prairie openings to the west. The fisheries were running full blast at each lakeshore town so grandfather found employment in getting out hoop poles and staves for a coopershop.

The second year at Racine was a trying one. Certain religious fanatics under the name of Millerites preached their doctrine far and near. It seemed to gain headway as some of their prophesies came true. They claimed, on a certain day in May, the world was coming to an end and that early in the fall of '41 there would be a heavy snow which would melt and turn to oil and in the spring of '42 catch on fire, destroying all animals and vegetable life.

The snow came in the early fall and with it many converts. Officers in charge of harbor work refused to let grandfather continue hauling timber as they seemed to think it was useless to get out timber that would be burned to ashes in a few months. The deep snows stuck much longer than usual. The Millerites were putting their doctrine across in fine shape. The turning point came when the snow melted to water as usual. The fatal day passed and people wondered at their own foolish superstition.

When grandfather arrived at Racine the fall of 1839, many new buildings were in course of construction. The United States Government had completed a lighthouse on the lake bank and there was a courthouse costing in the neighborhood of $10,000. The Racine House, a good hotel for that period, was finished the year after his arrival as well as several business places. He started to clear and break up land for

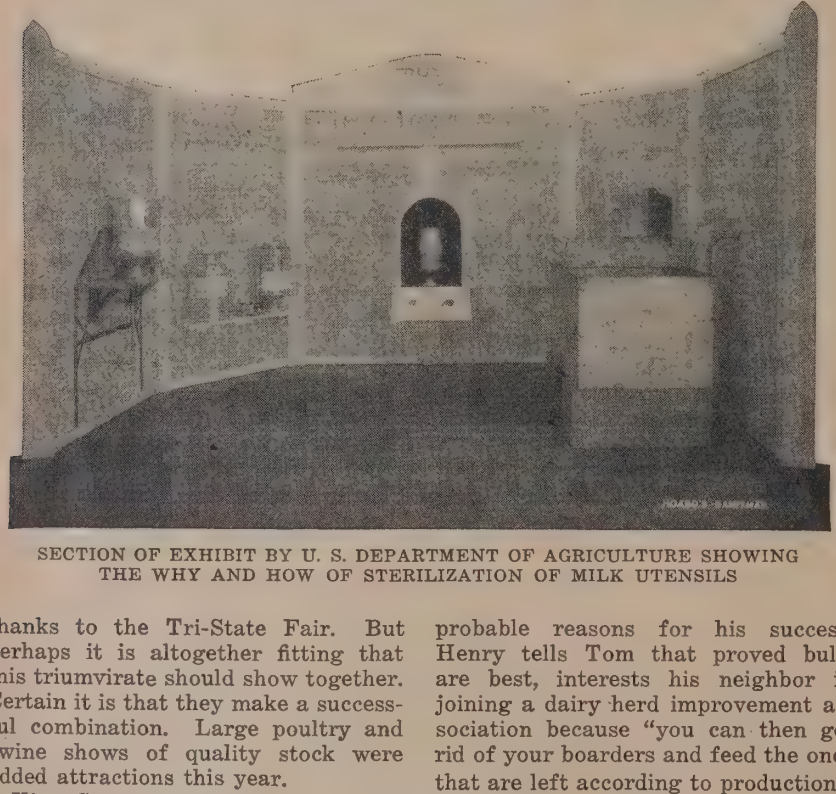
A LONG JOURNEY TO A STRANGE LAND

In 1838 the call of the wild was so strong that grandfather sold his farm at Cleveland and set out with his family and equipment in two covered wagons for Wisconsin. The roads were rough and muddy, only a few miles could be made in a day, and horse theft organizations flourished.

(Continued on page 1078)

NATIONAL DAIRY SHOW DOWN IN DIXIE

DISTINCTLY different was the National Dairy Exposition down in Dixie held at Memphis, Tennessee, October 15 to 22—different, yet the same; different in having its location for the first time in the Southland; different because it was held with a big fair—the Tri-State Fair; different because it was divided—a manufacturers' show at Cleveland, the International Milk Dealers at Columbus; but the same because the spotlight still played on the grand old dairy cow, the mother of prosperity and the keystone to health and happiness.



There is interest and enthusiasm for dairying in the South. You could see it in the exhibits of the Tri-State Fair, in the delegations of farmers from the southern states who visited the Dairy Show; you could sense it in the crowds; you gained that impression talking with southerners; and as you studied the exhibits made by several states in that interesting group banded together under the banner "Dairying in Dixieland," you knew it was there. To cement and develop that kinship for the dairy cow in the South was one of the big purposes of the Dairy Show at Memphis.

The cow, the sow, the hen, that eternal triangle for profits in dairying, were on display at Memphis. This is the first time that the National Dairy Show has been augmented by poultry and swine departments,

(Courtesy Memphis Chamber of Commerce)

KING COTTON AND QUEEN COW JOIN HANDS AT NATIONAL DAIRY EXPOSITION

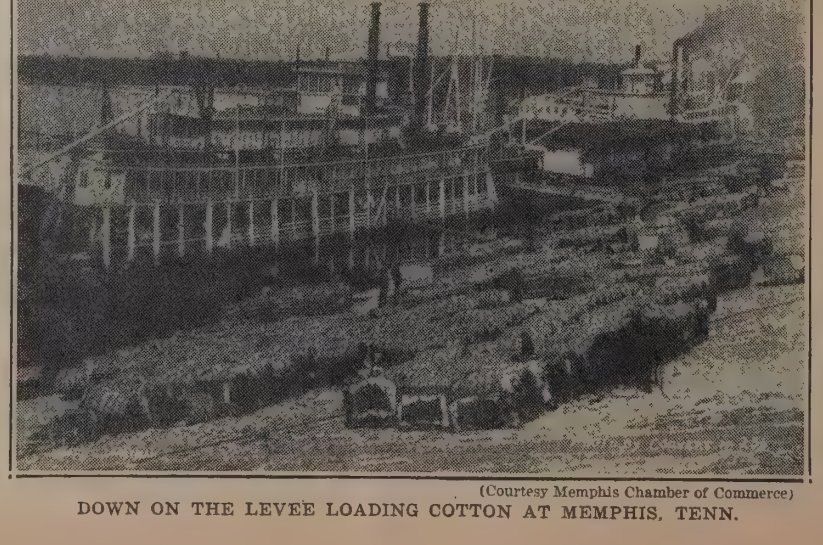
SECTION OF EXHIBIT BY U. S. DEPARTMENT OF AGRICULTURE SHOWING THE WHY AND HOW OF STERILIZATION OF MILK UTENSILS

thanks to the Tri-State Fair. But perhaps it is altogether fitting that this triumvirate should show together. Certain it is that they make a successful combination. Large poultry and swine shows of quality stock were added attractions this year.

King Cotton and Queen Cow joined forces at Memphis and pointed the way to a greater agricultural era in the Southland. Other outstanding features at this year's show were the record breaking judging team competitions.

There is always an abundance of useful information in the educational exhibits. The U. S. Department of Agriculture, the National Dairy Council, and the National Cheese Institute put across their messages in simple but effective booths and demonstrations. In the same building with these exhibits were the dairy machinery and equipment displays—separators, electric refrigerators, barn equipment, farm press, commercial dairy feeds, washing powders, farm electric light plants, and other interests, making just as good if not a better show than formerly.

Tom and Henry



Upon entering this building the thing to attract your attention is the booth in which Tom and Henry hold forth. Tom and Henry are two farmers perpetrated by the U. S. Department of Agriculture who engage in an interesting and instructive dialogue—a discussion on better dairying.

Appreciating that Henry is the better farmer, Tom inquires of him the probable reasons for his success. Henry tells Tom that proved bulls are best, interests his neighbor in joining a dairy herd improvement association because "you can then get rid of your boarders and feed the ones that are left according to production," and states that his records have taught him to grow silage and legumes, and when Tom complains that he has had a lot of milk returned lately, Henry urges him not to lose sight of the essentials in the production of clean milk—clean, healthy cows, small-top pails, sterilized utensils, prompt cooling, and cold storage.

Good Cows Basis of Success

You read over an adjoining panel that good cows are the basis of success, and there you see contrasted the production and consumption of Bluey, an average cow, with a blue outlook; and Blossom, a cow with a rosy outlook for her owner. Bluey produced 4,500 lbs. milk, 175 lbs. butterfat valued at $96, with an income over feed cost of $44. Blossom produced 9,000 lbs. milk containing 350 lbs. butterfat; value of product, $191; feed cost, $75; and income over feed cost, $116. Which cow would you rather have? The figures given show practical results for cows kept under actual farm conditions as tabulated for 14,384 cows in dairy herd improvement associations.

Flanking Tom and Henry on the other side is an exhibit answering the question, "Why feed high grade legumes?" Here is what you are told: "Cows fed on high grade legume hay get enough lime from the hay to provide that which is needed for milk secretion. Cows so fed are likely to have strong, healthy calves and to give large quantities of milk in succeeding lactation periods. Cows fed on low grade hay fail to get enough lime from the hay to provide for milk secretion and so take the additional amount needed from their bones.

(Courtesy Memphis Chamber of Commerce)

DOWN ON THE LEVEE LOADING COTTON AT MEMPHIS, TENN.

Cows which draw large amounts lime from their bones are likely have premature, dead calves and give small amounts of milk in su ceeding lactation periods."

Did you ever stop to think that t udder is the source of a three billi dollar industry? Photographs a preserved sections of udders a shown in another booth together wi some interesting facts recent learned by investigators in t Bureau of Dairying. Their concl sions were that the amputated udde had capacities great enough to ho from 4 to 6 gallons of liquid und moderate pressure. Milk secreti seems to be a continuous proce Pressure of the filled udder tends check secretion—that's why more fr quent milking of heavy producin cows results in greater total mi yield.

Fertility in Dairy Animals

You learn two important fac about maintaining fertility in dai animals from another U. S. Depar ment of Agriculture exhibit. Exerci for at least 1½ hours a day maintai and restores fertility in the dairy bu One way of exercising bulls is hitch them onto a pole fastened one end, driving them in a circ Experiments have shown that sprou ed oats fed to aged bulls and to co aid conception. Breeding cows ha conceived when fed daily 13 to 15 lb of sprouted oats (5 lbs. dry oat for periods averaging 60 days. Oa just germinated as well as oats wi sprouts 2½ inches long have broug results.

You are glad to be reminded th unsterilized dairy utensils are t main source of contamination in mil Sterilizing dairy utensils is this e hibit. The importance of thorou drying of the utensils and of steril ing pails from which calves are f is emphasized.

Successful Dairying

Do you know what's needed f successful dairy farming? Benea a prosperous dairy farm scene y read an answer to the question. The are four items, count' em—farm gro ing legumes, good pastures, and grai cows producing 5,000 lbs or more milk; equipment for high quali products; equipment for economi marketing.

Nobody knows what will happen t morrow, but if we know what ha pened yesterday and what is happe ing today we can make a good gue Market statistics show us a picture the past and help us to understa the present, and these two things t gether enable us to intelligently a ticipate the future. These are t values of market news reports of t U. S. Department of Agriculture pointed out to you in another exhib

The butter price curve explains you how market statistics are us A gigantic farmers' account book te you in a striking way about "t dairyman's dollar," and shows you typical account of the year's busine of more than 2,300 dairy farme whose farm operations were analyz by the U. S. Department of Agric ture in 1925.

Dairy Council Food Show

It just makes you sort of hung for dairy products—milk, cheese, i cream, butter—to look at the attra tive booths which featured the exhi of the National Dairy Council. Tak for instance, ice cream. Makes y think of the Frozen North, doesn't and there before your eyes is a pret little snow and ice scene with the d teams traveling across the horiz

merica's Pleasure Food" and "Ice am Our National Food Dessert" the titles that greet you. You l on and learn that nut ice creams e the added nourishment and fla- of walnuts, pistachios, almonds, lnuts, filberts, and pecans. Ice m is a protective food made from and cream; it promotes growth health. Ice cream contains fruit rs from the gardens of the world, ocolate, vanilla, peach, pineapple, wberry, cherry.

Cooks Stop Gambling

on't gamble with your cooking, housewife is warned. A roulette el, moving and stopping, moving stopping, attracts you and in the breath you read how to avoid gamble—always use butter. Win th for your family. Butter pro- es growth and health, helps to d strong bones and teeth, furnish- ower for work and play, builds re- nce. Butter is the foundation of l taste. Use freely on breads and iwiches, in creamed soups, on led foods, in sauces, cakes, and erts. Butter is the essence of sun- t and clover, one of Nature's best s to man.

National Cheese Institute

What about cheese? You do not remain in doubt as to its value as od. If after reading the informa- given you by the Dairy Council bit you are still in doubt, just look ss the way at the fine exhibit of National Cheese Institute and all ot will be removed. You can learn t about the value and manufac- of cheese in that demonstration.

ut to get back to the Dairy Coun- message on cheese. First off, you l, "Cheese is a nutritious food." l then—cheese dresses up rice and atoes, macaroni, and breads, add- tasty flavor to everyday dishes. ause it is an economical source of best protein, cheese can be the n dish of the meal. Cheese sup- s you with protein for muscle ding, minerals for bones, fat for rgy. It is a rich source of the mins which promotes growth and tects health.

The pupils respond the following: To grow strong well I should: 1, sleep many rs with the windows open; 2, eat e fresh fruits each day; 3, drink lass of milk at each meal and one ore bedtime; 4, eat slowly, chew- thoroughly; 5, eat butter, it will me grow; 6, drink at least four ses of water daily; 7, eat whole in breads and whole grain cereals; rush teeth morning and night; 9, fresh, leafy vegetables every day. uality improvement was empha- d in another panel. Careful pro- tion insures satisfied customers better market conditions for your

The Oklahoma A. and M. College group of boys won first place in the southern section judging contest. Eight teams competed in this contest. The Oklahoma boys placed first on Jerseys, second on Holsteins, fourth on Guernseys, and eighteenth in the national contest out of 32 competing.
Left to right: Professor P. C. McGilliard, coach; R. Miller, R. Shafer, R. Nelms, and S. Stevens.

milk. "Daily mid-morning milk service for adults in offices and factories minimizes fatigue," so you discover, "and increases accuracy and efficiency, protects health, and reduces losses of time through illness—reduces accidents in factories, builds up those with low vitality, and increases capacity for the enjoyment of recreational hours." Thus is the story of milk in the factory told.

Standing for a few minutes before the exhibit which shows the 4-H demonstration on dairy products successfully introduced into club work by Iowa girls a year ago, you learn many good lessons about the use and value of dairy products in the diet. The demonstration works in several clever stunts as well as "packing a mighty wallop" in useful information.

Dairying in Dixieland

In the beginning we said that the South is interested in dairying. Mild climate makes long pasture seasons which in turn help to make healthy cattle. Legumes can be grown successfully. Dairying adds fertility to depleted soils. There is a demand for dairy products. These are some of the reasons you hear given for this interest. You gain a splendid idea of the possibilities and progress of the dairy cow in Dixie by looking over rather carefully that fine collection of booths in the educational building called "Dairying in Dixieland." The central display is a huge map of the United States with the thirteen states in this Southern Empire blocked out. A placard in the front of the booth gives statistics showing the number of dairy cattle now found in each of these states, the annual rainfall, per cent of tuberculosis in cattle, and the average summer and winter temperatures.

Tennessee Tells 'Em

Since Tennessee is host to the Dairy Show you are rather inclined to give her exhibit careful scrutiny. And a right good one it is, too. Under the heading, "Tennessee, the Dairyland of Dixie," you are given the following facts: Tennessee leads the South in creameries, condenseries, cheese factories; is the fourth state in the Union in number of Jerseys; 40,000 head of dairy cattle are shipped to other states annually; ideal soil and climate; excellent dairy markets.

An object lesson for every dairy farmer is contained in that part of the exhibit headed "What made the difference?" The parable, which is a true one, goes something like this: Two Tennessee farmers were members of the same dairy herd improvement association. Their cows were alike, feed the same kind and price, product was sold on the same market, BUT—Farmer "Will Starve 'Em" in one year fed and milked 13 cows whose total income over feed cost was $307. Each cow averaged 2,790 lbs. milk, 130 lbs. butterfat, and $57.49 value of product. All cows were fed the same average of 1 lb. of grain daily.

Farmer "I Feed 'Em" in one year fed and milked six cows and his total income over feed cost was $464. Each cow averaged 6,070 lbs. milk, 323 lbs. butterfat, and $135 value of products. Both herds were fed the same hay, also the same grain mixture, but this herd had the grain fed in proportion to what each cow produced, an average of 5 lbs. daily. The income over feed cost of the average dairy cow in Tennessee can be doubled by proper feeding.

The Tennessee Jersey Breeders' Association booth traces the history of over 40 years which that breed has enjoyed in that state. It makes an interesting study. The Jersey is strongly entrenched in the South.

South Carolina Good Cow State

You need entertain no fears that the dairy cow does not do well in South Carolina because, according to their display, South Carolina produced the first 1,000-lb. butter record in the South; has the world's record senior 2-year-old in the 365-day class; has the former world's record 2-year-old Jersey cow in the 305-day class; has the world's record Guernsey cow in class CCC; has the highest record Guernsey cow in the South; and has 15 cows with records of over 800 lbs. butterfat. Dairying is the greatest opportunity in South Carolina, says a sign. And to show you the help to better farming rapidly becoming available down there, you are told that South Carolina ranks sixth among the 48 states in hydro-electric development, and construction now in progress will place her third.

"Profitable dairying depends on knowing your cows," says Virginia in her exhibit. Over 10,000 Virginia dairy cows have yearly records and there are over 400 Virginia farmers in dairy herd improvement associations. Again the story of two cows faces you. This cow in one year produced 5,934 lbs. milk, 206 lbs. butterfat; feed cost, $126.62; total cost, $216; net profit for one year, $4.00. Cow No. 2 produced 8,809 lbs. milk, 349.4 lbs. butterfat; feed cost, $146.14; total cost, $243.56; net profit one year, $105.

Louisiana and Mississippi

Here are some of the advantages offered by Louisiana: 365 growing days in the year and crops for every month; soil types to suit any crop; 237,000 dairy cows, pasture abundant; a southern coast well adapted to the production of citrus fruits; strawberries and vegetable crops valued at $9,000,000 annually; leading rice producing state in the Union; leads the nation in the production of furs; famous oyster beds and fishing grounds; largest gas fields in the world; produces 95% of the sugar cane grown in the United States;

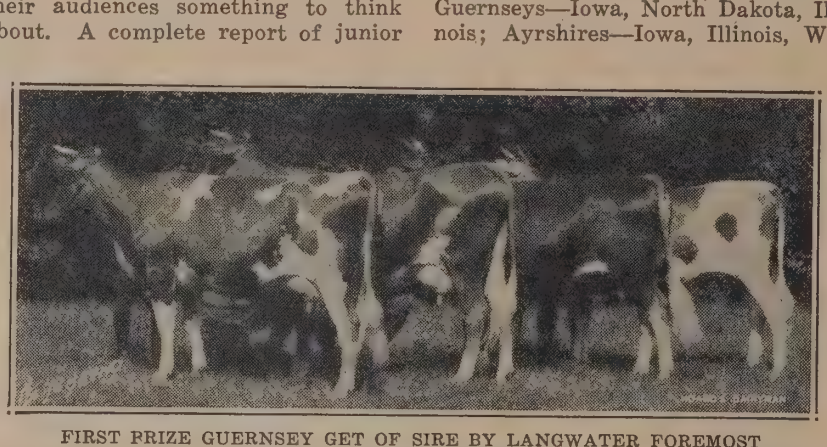
5,600 miles of improved highways; navigable waters total 4,700 miles.

Mississippi's dairy industry is growing, you are informed by her exhibit, and this fact is demonstrated by the increase in butter production per minute. In 1912 one-half ounce worth one cent became in 1919 six pounds valued at $3.73 and increased in 1926 to 14 lbs. per minute valued at $6.50. The slogan for this exhibit is "Down in Old Miss' where the sun shines brightest and the grass grows greenest."

Other State Exhibits



North Carolina welcomes dairy farmers, you read over their exhibit. And why? To meet the average American per capita consumption of dairy products North Carolina needs to produce annually 30,495,000 lbs. more butter, 11,210,000 lbs. more cheese, 110,354,000 gallons more fluid milk, 5,985,000 gallons more ice cream. Some 427,000 additional cows would be required to meet this need. The average price received by North Carolina dairy farmers in 1926 was: Bottled milk 18c a quart; fluid milk at plants $3.48 per cwt.; butterfat at creameries 45c a pound; milk at cheese factories $2.20 per cwt.

In her exhibit Oklahoma stresses the fact that home markets increase dairy profits. A big map shows the principal highways and markets. You learn that Oklahoma eats 5,380,000 gallons of ice cream and consumes 70,000,000 lbs. of butter of which she makes 52,860,000 lbs. Arkansas and Texas also have booths and representatives to tell about dairy possibilities. Yes, the South is interested in dairying.

In the cattle barn two exhibits—one a fine educational exhibit by Femco Farms, Minnesota, and the other "Red Lady," the highest butterfat producer in the South, attracted much attention. May Walker Ollie Homestead, former United States champion butter producer, featured the Femco Farms exhibit. Her year's production of 1,523.23 lbs. butter was contrasted by pyramids built from pound cartons with the production of the average cow in the South.

Indicative of the intense interest of the South in dairying was the reported action taken by officials changing the name of the Tri-State Fair to the Mid-South Dairy Exposition and Fair, to become effective in 1928. Memphis newspapers gave splendid space and support to the National Dairy Show. One of the newspapers summed it up concisely when it said editorially, "Cotton may always be our king. Let us crown the dairy cow as our queen and mate these two for a royal offspring which shall be named Prosperity."

In a brown tent next to the "big top" judging arena the Purina Mills gave daily performances of the dairy play "Joe Guess," driving home better feeding practices in an impressive manner. Upon this platform, also, the several dairy breed associations gave interesting and instructive demonstrations in breeding and breed type. On Tuesday and Wednesday 4-H club demonstration teams gave their audiences something to think about. A complete report of junior activities at Memphis will be found in the junior department of this issue.

FIRST PRIZE GUERNSEY GET OF SIRE BY LANGWATER FOREMOST
OWNED BY EMMADINE FARM, NEW YORK

Dairy Products Judging

On October 17, some 14 teams took part in the eleventh Students' National Dairy Products' Judging contest. This is the greatest number of teams that ever competed. For the fourth time in succession Iowa State College won the team sweepstakes. In judging butter the Iowa State team was first, judging cheese was won by the University of Tennessee, Massachusetts Agricultural College was high team in ice cream judging, and Kansas State College was high team in judging milk. Leo Allen, Massachusetts, was high individual in judging all products; E. Wayne Frey, Kansas, second; Delbert Brazeale, Iowa third. High individuals in the several classes were: butter, Alvin W. Hare, Oregon; cheese, Russell R. Wood, Iowa; milk, Leo Allen, Massachusetts.

Judging Contests Break Records

Never before in the history of the National Dairy Show have so many teams participated in the students' judging contests. All records were broken when teams representing 32 agricultural colleges participated in the nineteenth annual college dairy cattle judging contest.

In winning this year's contest Iowa State College established another record, winning four consecutive big college student cattle judging contests. Iowa State won at both the Waterloo Dairy Cattle Congress and the National Dairy Exposition both last year and this year. It takes hard work, good material, and good coaching to pull a stunt like that.

Nebraska placed second and North Dakota third in judging all breeds at Memphis. The states ranked as follows in judging breeds: Holsteins—Nebraska, Iowa, Kansas; Jerseys—Oregon, Oklahoma, North Dakota; Guernseys—Iowa, North Dakota, Illinois; Ayrshires—Iowa, Illinois, Wisconsin. Members of the winning Iowa State team were Ray Monahan, Ted Besh, C. H. Thompson, Howard Mathews, alternate, and Coach Fordyce Ely. On the Nebraska team were Elvin Frolik, Austin Goth, Harold Fulscher, Glenn Hedlund, alternate, and R. F. Morgan, coach.

Ted Besh, Iowa, was high individual judging all breeds; L. O. Colebank, Tennessee, second; and C. H. Thompson, Iowa, third. In judging Ayrshires the teams ranked in this order: Iowa, Illinois, Wisconsin. Richard A. Brackett of Wisconsin was best individual Ayrshire judge; George E. Gosma, Indiana, was second and G. L. Stearns of Florida third.

Iowa again ranked at the top in judging Guernseys, followed by North Dakota and Illinois. Ted Besh topped the individual judges of this breed, with Austin Goth of Nebraska se and Clyde Barks of North Da third.

Nebraska was first in judging steins, Iowa second, and Kansas t Elvin Frolik, Nebraska, did the individual work in judging Holst Ted Besh, Iowa, second; J. E. Intire, Florida, third.

Oregon proved the best tean judging Jerseys. Members of team were Homer C. Bray, A. Hare, and Frank W. Sherwood; C. Jamison, coach. Homer Bray the highest individual score for breed; W. C. Bute of Missouri second and E. C. Woods of Virg third.

The committee of judges for breeds consisted of J. B. Fitch, l sas, and O. E. Reed, Michigan. contest was in charge of W. W. S

Vocational Judging Contest

A complete report of the vocati students' judging contest will found in the junior departmen this issue.

Dairy Products Awards

The dairy products show this attracted a large number of ex tors from many states and accor to S. H. Anderson, executive secre of the National Dairy Exposi was one of the outstanding feat of the Exposition at Memphis.

Jim McAdams, Minnesota, won gold medal for the highest scor storage butter among the exhibits tered by 139 contestants from 2 states. The score on McAdams' b ter was 94.5. Paul Moerman, Io had the second highest scoring bu sample in this class, 94.35.

Wisconsin won first and secon the American cheese class when Ju tin Kubitz and Fred Winkler sc respectively on their cheese, 95.5 95.25. Fifty samples were ent from 12 states. Scoring 97 po each, William Gempelier and Osc Schneider, both of Wisconsin, took gold medals on Brick and Limbu cheese, respectively.

Minnesota fresh butter made b W. Dalsgaard won the gold meda competition with samples from 2

r states and Canada in which 182 estants entered their product. The ning sample scored 95 points and er made by C. N. Hansen, Illinois, second, scoring 94.75.

The Dairy Cattle Exhibit

he dairy cattle exhibit at Mem- this year was an agreeable sur- e to many. It is the first time show has gone very far south of Chicago—New York line and not yone expected that it would have table and high quality exhibit for f the breeds. It did just that, ever. There were some 850 good le shown, and not so many as a ago perhaps, but enough to in- e most of the good ones from the ier shows, north as well as south, everyone who attended must been satisfied that he saw the dairy cattle show of the year.

he second surprise, and to us it ned the more important, was the rest taken by spectators in the y cattle judging. More often not the seats around the judging a at the National are empty, and spectators are limited to a few g the rail and those who stand le the ring.

his was not true at Memphis. We r saw so many interested specta- , and we would like to underline word "interested," around a Na- al Dairy Show ring before. People e there to see the cattle placed hundreds of them spent seven s of their fair day on a hard h watching, than which no better f of their interest is needed. This true not of one day alone, but of y day and we are glad it was so. are inclined to believe that the y more nearly served its purpose an educational exhibition than it n has in the past.

The Brown Swiss

udge: H. H. Kildee, Iowa.

he Brown Swiss seldom have so e a show at the National as they t Waterloo and it wasn't to be ex- ed that it would be large this in a non-Brown Swiss territory. ertheless they had a very good y that included their best winners n earlier shows. Eighty-five head esented eight different herds.

. F. Zoller of New York was the viest winner, at least so far as s were concerned. He won five of h eight single classes in which he entries and had in addition all npionships except senior and nd champion female. His only bull entries were champions in r respective divisions.

he two best bulls of the show e Maiden's Vronicka's College owned by Zoller and Ursula Sta- owned by Hull Bros. Last year e two shown as three-year-olds at several fairs, usually to the antage of the Ohio entry, but he lost just enough of his smooth- with a year's development so that his New York competitor has been able to beat him regularly this season. Maiden's Vronicka's College Boy has improved; the other bull doesn't show too good at the shoulders.

The Iowa Brown Swiss Company showed the two best aged cows, June's College Girl and Silver Belle, a pair that has been at the top wherever shown all fall, and two that are hard to beat. The former has been first almost always but one could pretty well justify a placing with either one up. "June" is larger, has a better rump, and an udder that looks to be of better quality, but her stablemate is smoother at the shoulders and has a better placement of teats.

Maiden of Meadow Green, a senior yearling full sister to the grand champion bull, was the outstanding junior heifer and an easy junior champion but she wasn't good enough to beat the senior champion aged cow for grand championship.

Zoller won first get of sire with the same group that has been winning all season—the grand champion bull, junior champion heifer, a 4-year-old cow, and another senior yearling heifer—by Vronicka's College Boy.

The awards follow:

Bull 4 years or over—1, Zoller on Maiden's Vronicka's College Boy; 2, Hull Bros. on Ursula Stasis; 3, Bower on Edgard C. Bull 3 years, under 4—1, Iowa B. S. Co. on Vogel Boy 2nd of Valley Grove. Bull 2 years, under 3—1, Suydam on Betsy Girl's Prince; 2, Stevens on Gallatin Browney's Prince.

Cow 5 years or over—1 and 2, Iowa B. S. Co. on June's College Girl and Silver Belle; 3, Zoller on Jonquil of Kinnelon; 4, Hull on Swiss Valley Girl 8th; 5, Bower on Betty of Lake View. Cow 4 years, under 5—1 and 4, Zoller on Elsie A. of Bowerhome and May of Meadow Green; 2, Iowa B. S. Co. on Belle Silver; 3, Bower on Betty A. of Bowerhome; 5, Suydam on Prince's Nellie. Cow 3 years, under 4—1, Zoller on Carl's Valley Girl 9th of L. V.; 2, Bower on Beautiful Belle of Bowerhome; 3, Hull on Nellie F. 2nd Stasis; 4, Suydam on Beauty Belle. Heifer 2 years, under 3—1 and 4, Bower on Duedda of Bowerhome and Septa of Bowerhome; 2, Wampler on Miss Mary W. of Vandalia; 3, Hull on Dayton Beauty of Northside; 5, Zoller on Prince's Beauty.

Get of Sire—1, Zoller on Vronicka's College Boy; 2, Iowa B. S. Co. on Valley Grove Weiss

Get this extra protection plus extra wear from pressure-toughened rubber

EXTRA life, more strength, added toughness are pressed into Goodrich Hi-Press Rubber Footwear when it is made. That's why thousands of folks on farms are getting sure protection—and more months of wear—from the Hi-Press brand.

You find this name on boots, gaiters, galoshes, rubbers—all kinds of rubber footwear for use on the farm. And you find big, thick soles of live, springy rubber—strong, honest reinforcements—and real comfort in every pair.

Women can also have Hi-Press protection. On galoshes or stylish light rubbers the name means that extra wear is pressed in the rubber. And ZIPPERS—with the genuine smooth-gliding HOOKLESSFASTENER—also have pressure-toughened soles.

The Hi-Press brand is in such demand that over fifty thousand dealers in towns and cities of every size can supply you.

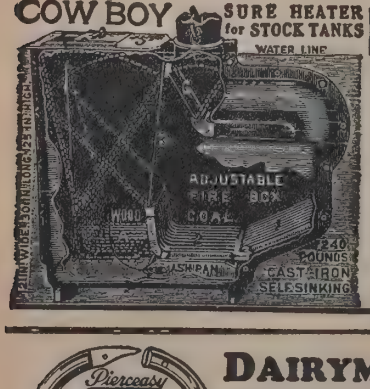
The muscles give it strength

IN men and boots it's muscular strength—not heaviness—that counts. Only in Top Notch Buddy Boots will you find the "muscles" of tough, live rubber that give *extra wear without adding extra weight.*

These ribs or muscles strengthen the sides of the boot and prevent cracking. They are a patented, exclusive Top Notch feature—that's why no other boot will give you such long wear as the Top Notch Buddy.



Soles and heels are extra thick. The trim-shaped leg prevents the foot from slipping up and down. In every respect you will find it a boot of wonderful durability and comfort.

Ask for Top Notch Rubber Footwear by name—boots, arctics, heavy and light rubbers, for men, women and children.

COW BOY SURE HEATER for STOCK TANKS

KEEP COWS HEALTHY

Illinois State Experiments show that 85% of Cows kept in Close Warm Barns tested Tubercular. Prevent this by keeping water tank in open barnyard equipped with a Self-Sinking

COW BOY TANK HEATER Saves Money Every Week

Turn cows out of barn to drink in Fresh Air and Warm Water. "Better drink from a Large Tank than from a Small Bowl." Burns coal, cobs or wood. Outlasts all others. Durable, practical, reliable. Quickest to heat; strongest draft; ashes removed with no check to fire; adjustable grates; keeps fire 24 hours. **ABSOLUTELY SAFE.** Warm water helps digestion; saves grain.

"Purchased 3 of your Tank Heaters last winter, worked very satisfactorily and are well worth their cost. Every stockman should use one." W. H. PEW, Prof. of Animal Husbandry, Iowa State College, Ames, Ia.

A Co-operative Centralizer

WALTER E. DOBBINS, NEBRASKA

TWENTY-THREE years ago a poor Danish immigrant landed upon American soil. Scarcely out of his teens, unable to read or write a single word of the English language and "broke," the youth set out to conquer. The lad had grit, ambition, and a thorough knowledge of the creamery business.

That boy was Ole Hanson, present general manager of the Farmers' Equity Co-operative Creamery of Orleans, Nebraska, the largest butter-making company of its kind in the world, an organization backed by over 10,000 farmer-stockholders.

Hanson did wonders. He has performed miracles. He is the Houdini of the butter world, the King Midas of the Nebraska dairy industry. Everything he has touched has turned to gold—yellow gold that has brought him both fame and fortune.

Now Hanson, like many other successful business men, has certain principles and pet theories by which he accomplishes things. Here in part is a brief story of his hardships and his successes:

"Many people have quizzed me about our organization," Hanson explained, "and I tell all the same story. I firmly believe that strict, approved business policies, efficient management, and absolute fairness to the stockholders of the company are the requisites for the success of co-operative societies.

"Many co-operative organizations fail because they try to do things that no one else has tried to do. We try to do business at a profit at all times. Our creamery is operated like any other business. Everybody works hard and keeps on working.

"We forget all about sentiment out here in Orleans. We stick strictly to business principles. That's why we are where we are."

Hanson dropped back in his swivel chair and gazed thoughtfully out of the window. A truckload of cr cans was being unloaded outside was the fourth truck I had seen w in an hour.

Perhaps Hanson was thinking through the years, the days be his success, how he plodded al barely able to keep his feet. many Danish boys, Ole in his y presumably had thought Minne the capital of the United States, it was that glorious state that claimed Hanson as a future citi

First a section hand, then washer, buttermaker, salesman, moter, and so on until he reached present heights, reads the story Ole's early life.

EMPLOYEES AT ORLEANS
The day force, with Ole Hanson at the extreme left with cap in hand.

Hanson's reign at Orleans was bed of roses to start with, nor now. In fact Ole made many st ling discoveries soon after he c to terms with the Nebraska organ tion. The mere facts would f forced many a man to turn to retr But not Ole Hanson.

The Orleans creamery had ope in May, 1917, and exactly one later was ready for the sheriff. company had lost $7,518.30, w was considerably in excess of the

FARMERS' EQUITY CO-OPERATIVE CREAMERY, ORLEANS, NEBRASKA

tual cash. It had suffered the u ailments of a new concern—s volume, no credit, untrained h poor management, and few t sources.

At the end of the first six mo of Mr. Hanson's administration the period ending Nov. 18, 1918, h creamery showed a profit of $8,51 A recent report handed down by auditing firm reveals that in years, June 1, 1918, to Nov. 30, 1 or the time during which Hanson been affiliated with the organiza the total profits have reached astounding sum of $242,584.57. amount is equal approximately to cents profit on each pound of but fat handled.

"The dairy farmer still has

learn," Hanson declares. "In the st place there is dire need of testg associations everywhere. I often nder how many farmers know at part of their herd is profitable. ey will never know until they keep daily record of each cow in pounds milk produced and the per cent of tterfat. Our farmers still have a g way to go in testing, improving eir herds, and forever weeding out e unprofitable boarders.

"Our receiving territory covers ur states, Nebraska, Wyoming, lorado, and Kansas. Some of the eam is shipped to us from points 0 miles distant. At least twenty-e per cent of the cream is by direct ipment, although over a hundred wns are on our sending list," Hann explained.

"The plan of co-operation is simple, simple as we know how to make " Ole stated. He went on carefully, Ve of course experience stiff compeion in the field with the old line mpanies but we manage to meet the nditions just as we find them. Our mpany pays out just as much raight cash as our competitors do on e day the cream is purchased, so I ess everybody is satisfied."

"How are the profits distributed?" asked, knowing that it must be a fficult problem with the countless ndreds of stockholders or cream llers as they should be rightly lled. Hanson's explanation can be mmarized something like this: The oks are balanced at the end of the ar and the profits declared. Deducons are made for depreciation on achinery and buildings, using the vernment approved figures. Ten per nt of the balance net earnings are t aside in a "sinking fund" to be ed only in extreme emergencies. e balance of the net profit is then vided among the cream sellers on a r pound butterfat basis.

The first $100 earned in this way the individual shipper is held back and he in turn is given stock for his earnings. Three per cent interest is paid each year on the stock.

"But supposing the farmer moves away before the end of the year."

"Oh, that causes no trouble," Hanson replied. "We are bound to pay the man the amount of money he has accumulated. It's in our by-laws.

"We received over 125,000 cans of cream last year and as I told you before we shipped out over 3,000,000 pounds of butter. Most of it went to Chicago or New York. There were 175 cars in all and if they could have been lined up in a string they would have made a line two miles long."

Co-operation was the magic word for the Danes. In fact the origin for this famous move is credited to a group of typesetters employed by a Copenhagen newspaper who "ganged" together for the purpose of obtaining drinks and foodstuffs at wholesale prices. As more people began to take advantage of the idea, then it became necessary for the printers to hire someone to do the buying and handle the affairs. This, according to Hanson, was the foundation of the present day co-operative movement.

Hanson is very modest about his own abilities. He ascribes most of the credit to Mr. H. Z. Baker, president of the Orleans creamery, who likewise was one of the early followers and believers in co-operation. It was Baker who carried the company through the embryo stage and it is his principles that have stood the test of years.

The Orleans company was organized after many stormy meetings. The board of directors set its goal at $100,000 but after two discouraging years only a scant $9,000 had been raised. It was Baker who urged the farmers to go through with the proposition. The whole thing was headed for the rocks until Hanson came along but this able pilot steered the craft seaward and the ship is still afloat.

Oregon Has New Long Distance Jersey

Poet's Mabel Mowat, a pure-bred rsey owned by Karl Hanneman of egon, has just gained the distincn of winning her fourth Medal of erit awarded by the American Jery Cattle Club.

In her latest or sixth test, Poet's abel Mowat produced, with calf, 8.25 lbs. fat and 15,551 lbs. milk in 3 days. Her milk averaged 6.10% tterfat for the year. Mowat has so r produced 4,391.17 lbs. fat, equivent to 5,165 lbs. butter. Her averge yield for the six tests is 732 lbs. t or about four times the average all cows in this country.

The records of Poet's Mabel Mowat e tabulated here so that her work ring the past few years may be en at a glance. All six tests were pervised by the Oregon Agricultural College:

ge	Lbs. milk	Lbs. fat	% fat	Days

U. S. Cattle to Greece

Bearing on her after-deck fifteen ills and heifers of five different eeds, the finest products of Ameria cattle raisers and representing x different states of the Union, the ty of Eureka of the Export Steamip Company sailed from her dock Brooklyn for Greece early in Sepmber. They are a bovine good-will offering to the people of Greece, and are sent in accordance with a comprehensive plan to regenerate the agriculture and the animal husbandry of that historic country. The animals were contributed by philanthropic breeders of highly bred stock. They were assembled through the courtesy of Ery Kehaya, president of the Standard Commercial Tobacco Company, who has donated $100,000 to assist in the agricultural renaissance of Greece in co-operation with the Near East Relief.

The blooded cattle in this shipment were preceded in December last by a shipment of highly bred American fowl, which were donated by their breeders and by a shipment in April of aristocratic pigs, headed by Charles M. Schwab's celebrated "Colonel Broadcaster." These were placed with the Near East Relief farm school for orphan boys.

The list of donors of the highly bred animals, includes Marshall Field, a Guernsey bull; Clarence W. Barron, a Guernsey bull; E. T. Meredith, former secretary of agriculture, a Jersey heifer; Ery Kehaya, a Brown Swiss bull bred by J. Frank Zoller; Warren Kinney, a Brown Swiss bull; Andrew C. Cobb, two Brown Swiss heifers; Henry Morgenthau, Jr., a Holstein bull; E. A. Moore, a Guernsey bull; W. H. Miner, a Holstein, bull; and W. W. Fry, a Jersey bull and a heifer.

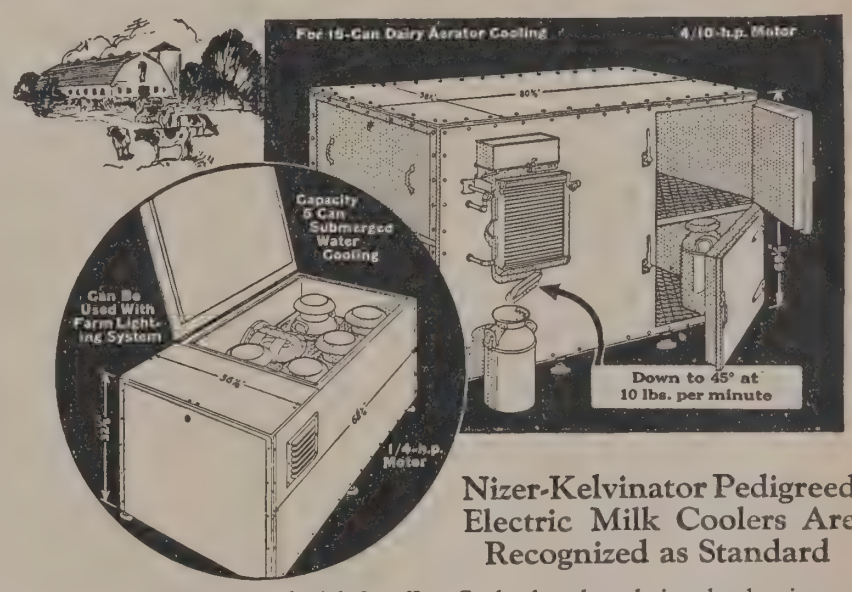
All of the animals shipped are representative of the best American stock; they are from sires and dams valued at many thousands of dollars each and represent many prize winning animals in their ancestry. They are sent without cost to the Near East Relief treasurey.—MRS. M. C. SMITH.

Announcing the Winners of the Nizer-Kelvinator Electric Milk Cooler Name Contest

The delay in announcing the winners of the Nizer-Kelvinator name contest was due to the great number of entries received and the many excellent names submitted, necessitating an extension of time for analysis and deliberation by the judges. The following names were unanimously chosen as the winners after careful consideration of every name submitted:

First Prize—$500.00 to *F. W. Royce,* Berkshire, New York. Winning name, "PEDIGREED."

Second Prize—Kelvinator Model 272 to *Frank Randolf,* Loraine, Illinois. Winning name, "GRANGER."



As it is impossible to award prizes to all who entered the contest, we believe, in justice to those who submitted names for Nizer-Kelvinator Electric Milk Cooler, that they should know why the winning names were selected.

Why These Two Names Were Selected

The name "Pedigreed" was selected for the first prize because every dairy farmer knows what it means—he knows what it means in relation to his herd—he knows that "Pedigreed" is out of the ordinary and superior to the common run that cannot show a notable record of past performance. Further—"Pedigreed" implies a background of ancestry and development and therefore focuses on the ancestry of Nizer-Kelvinator and the development from their "pioneering days" in electric refrigeration to the present successful achievement exemplified in the Nizer-Kelvinator Electric Milk Cooler.

The name "Granger" was selected for the second prize. A true "Granger" is a member of a Grange, a local branch of the Patrons of Husbandry, an association formed by farmers to further their interests. The name "Granger" is indeed befitting for the Nizer-Kelvinator Electric Milk Cooler, as the product and organization behind it have as an objective the furthering of the farmer's interests. A "Granger" is recognized as a successful farmer operating on a farm usually supplied with modern appurtenances, which again qualifies the selection of the name "Granger" for the second prize, as Nizer-Kelvinator Electric Milk Coolers should be part of the farm equipment of successful dairy farmers.

A Pedigreed Milk Cooler

Nizer-Kelvinator Pedigreed Electric Milk Coolers Are Recognized as Standard

They have proved up on the job for efficiency, practicability, economy and profitable operation. They have stood the test under the most rigid dairy farm conditions.

Nizer-Kelvinator Pedigreed Electric Milk Coolers are backed by one of the largest organizations in the world. They are made in two sizes and two types; aerator cooler with 16-can capacity and submersion type with 5-can capacity. Durably built to last practically a lifetime.

Nizer-Kelvinator Pedigreed Electric Milk Coolers have been designed and engineered to fit the dairy farmer's urgent need. They increase your earnings without increasing your herd; lessen labor and eliminate the worries incident to handling milk.

Talk to Your Milk Dealer About It

Your milk dealer, who hands you your milk check, will be glad to tell you all about these remarkable milk coolers. You can obtain them direct through him or most any Kelvinator dealer.

EDITORIAL COMMENT

DEVELOPING LEADERSHIP

The development of community agricultural leaders is to us one of the most important steps in placing farming upon the proper basis. For years we have urged organizing from the bottom up and not from the top down. There will be no danger of peasant agriculture when we have capable local leadership and strong local community organizations.

The Division of Dairy Extension work of the Michigan Agricultural College is planning to develop local leadership and to prepare it for larger service. Two leaders from each township in a county are being brought together for a day and one of the following subjects is being considered: "Possibilities of Dairying," "Factors in Profitable Dairying," "Quality in Dairying." These township leaders will, in turn, discuss these questions at local meetings in their communities.

It is easy enough for a few people to gather in some comfortable hotel and discuss ways and means of serving the farmer. We do not question the sincerity of most men gathered at such places, but we do question the advisability of continuing such conferences. What is needed now and what has been needed for a long time is men to roll up their sleeves and get out into the country where the work is waiting.

The plan to meet with two local leaders in each township in a county and discuss with them topics which they, in turn, can discuss with the people in their community is one way to help agriculture. The sooner we realize this and get behind an educational program of this character, the better it will be for agriculture and those making a living from it. We are having altogether too much talk and too little action.

NATIONAL DAIRY EXPOSITION

The twenty-second National Dairy Exposition held its annual meeting at Memphis, Tenn., a complete report of which appears in this issue. We believe the Dairy Exposition went south at a propitious time, for there is real sentiment for the dairy cow in Dixieland. The South is developing a dairy industry. Tennessee produces annually $50,000,000 worth of dairy products and in 1926 Mississippi manufactured over $3,326,000 worth of butter, also much condensed and fluid milk. The leaders in agriculture have long comprehended that the farmers of the South must sooner or later devote more attention to diversified farming and that the cow, the sow, and the hen would contribute substantially to their incomes. Too much cotton is grown. So long as this crop held full sway there was little or no opportunity to place southern agriculture on a permanent and profitable basis.

The Dairy Exposition with its fine cattle, its demonstrations, educational exhibits, and displays of machinery and labor saving devices has without doubt brought a new vision to the thousands of farmers who visited it and studied its many lessons. It is well to present facts to people, but the nation that progresses is the one that has a people of vision and understanding. It is the purpose of the National Dairy Exposition to stimulate farmers, to cause them to consider new opportunities in their business and better ways of doing things on their farms and plantations. Just how much good the Dairy Exposition will do the South depends on how much the farmers brought to it, how carefully they studied its lessons, and how well they comprehend the cow and her relationship to their other branches of farming.

The South needs the dairy cow, she needs her daily income and her food, and her soil needs her beneficent treatment. The cow leads the way and makes possible a sound system of agriculture. She is not the Alpha and Omega of agriculture, but rather the foundation upon which a sound farming business can be built and a productive soil maintained.

Cotton will remain king and the cow has already been crowned queen of the South. This is a happy combination and with faith and understanding will build a profitable and an interesting system of farming in our Southland.

TWO SIRES

The Bureau of Dairy Industry has been doing considerable work in investigating and analyzing cow testing association records, hereafter to be known as "Dairy Herd Improvement Associations." In a recent circular entitled "Proved Dairy Bulls" the Bureau gives some of the results of its tabulations as to records of dams and daughters.

Here is a comparison of two sires in different herds. Six cows in one herd averaged 489 pounds fat while their daughters by Sire A averaged 675 pounds fat, an increase of 186 pounds fat. Ten cows in another herd averaged 499 pounds fat and their daughters by Sire B averaged 280 pounds fat, a decrease of 219 pounds fat. The daughters of Sire A were better than their dams by 38 per cent, while the daughters of Sire B were poorer than their dams by 44 per cent.

Of course this is an unusual comparison. It is the extreme. Here is another one:

The production of the daughters of 200 sires was compared with that of their dams divided according to the production of the dams. Nine sires were mated with dams having a production of less than 200 pounds fat. Every daughter exceeded her dam. There were 49 sires mated with cows producing from 200 to 299 pounds fat, and the daughters of 44 of these sires exceeded the production of their dams. In the next classification of 300 to 399 pounds fat for dams, the production of the daughters of 57 sires was better and of 28 sires was poorer than their dams.

When we come to the higher producing dams of 400 to 559 pounds fat, we have a different story. The production of the daughters of only 28 sires was better and of 29 sires was poorer than their dams.

All of which shows that as cows increase in production, greater care must be exercised in the selection of a sire if production is to be maintained, to say nothing of being improved.

HOLSTEIN HERD TEST

The directors of the Holstein-Friesian Association of America have taken a decided forward step in breed advancement by the adoption at their recent meeting at the National Dairy Show of a sane and sensible herd test plan. The Advanced Registry has served a good purpose in locating high producing cows and in exploiting family lines. It should, and will, be continued.

The herd test plan, however, has within it not exploitation of individuals but the improved production of all animals within the breed. All animals in the herd will be tested, which will provide the owner with information whereby he can cull out the poor individuals and do more intelligent breeding. It will also provide the buyer with records on animals he purchases and increase his confidence in pure-breds. As Professor Anthony says of the Danish system, the whole idea of the herd test plan will be "to raise the average for the herd unit and in turn the breed, not by spotting occasional high producing cows, but by quickly spotting out the low and undesirable producers."

The Holstein herd test plan provides for twelve monthly tests throughout the year. Retests are to be made when unusual production is reported and there must be at least one surprise test during the year. The provision for a preliminary milking was wisely abandoned as it would make the system unwieldy and costly.

Under the new plan the owner must keep daily milk records, which are to be available to the inspector if called for if question arises. Cows may be milked three or four times a day, but the tester is not allowed to handle more than 48 milkings a day. If cows are milked twice a day, 24 cows may be included in a one-day test; if milked three times, 16 may be tested. Owners of pure-bred herds can conduct this work through a regularly organized cow testing association, provided the special ... quirements of the herd test are complied with.

For a time we feared that the real purpose a intent of the herd test plan would be defeated the insistence of incorporating into it the sa ideas of supervision and inspection that prevail advanced registry testing. Not only would this ha defeated the project through the cost, but it wo have tended to emphasize exceptional records ra er than raising the general breed average throu better selection and better breeding based on t records of large numbers of animals. We are a glad to note the report that the Ayrshire Assoc tion intends to slightly modify its herd test pl so as to conform more nearly with the Holst herd test. It is desirable to have more uniform between breed associations in these particulars.

We believe the herd test plan is sound, and th its adoption by other breed associations is as evitable as that day follows night. While expe ence will doubtless demonstrate desirable chang in operation, we trust that there may be co-o eration between the several breeds in the consid ation and adoption of these changes.

NOT MORE COWS

"But what's the use of producing more poun of butterfat per cow and supporting more co per farm, if farmers can't get more money f more product?"

This question comes from a Minnesota subscr er who believes farmers must be thoroughly o ganized if they are to place their business upon proper basis. In answer to his question it may said there is no use increasing the production cows or producing more dairy products if farme can not make more money. Since the inception Hoard's Dairyman we have urged farmers to ke efficient cows for we know there is no better w of increasing the profits of the dairy farmer th by keeping capable cows. No system of organiz tion or co-operation is capable of rendering assi ance to farmers that will give them a profit if th keep low producing cows. The man who says have as efficient cows as we need and all that necessary is to organize to make dairy farmi profitable is doing a positive injury to dairy pro ress and is blocking the way to profitable retur

We are not so foolish as to believe that all t dairy farmer must do is to keep efficient cows order to make a profit from his business. In eve issue of Hoard's Dairyman we give some lesson the value of organization and some reason w more co-operatives should be established for t purpose of processing and marketing farm pro ucts. We do not believe agriculture will be plac upon a proper basis until the farmer is thorough organized and until a good percentage of fa products are processed and marketed co-operativ ly. We do not believe it is essential for farmers handle all their products co-operatively but th must be in position to control a substantial pe centage if they expect their business to be plac on a comparable basis to other enterprises.

It is not good business for agriculture to simp produce products and then turn them over to oth agencies for processing and marketing. No oth manufacturer does this and why should the far er? We therefore believe most thoroughly in o ganization for the purpose of permitting farme to act together and to secure information abo their affairs, markets, etc. We also believe a have urged the establishment of local co-operati enterprises for processing and the federation these local institutions for co-operative marketi

We have no fear that overproduction will co when farmers all keep high producing herds. Wh we have such high intelligence among far ers milking cows, they will have too mu sense to keep on producing more than the mark will pay a fair price for. There will always be o portunity to eliminate low producing cows. T very fact we are increasing the production of dai products to meet increased consumption per capi and the demands of our increased populati with fewer cows is not indicative of danger

o'rproduction by keeping efficient cows. In 1926 w produced over 120 billion pounds of milk and w had over 600,000 fewer cows January 1, 1927, th n we had January 1, 1925.

Not more total production but more efficient pro- d tion is our great problem. Organization and co operation belong in the scheme of dairy progress a we must not lose sight of their value, but it w ld be most destructive to dairy progress if we d ended upon them alone for increasing the in- co e of the dairy industry. Efficient production is th most important factor to successful dairying a when hitched with organization and co-opera- ti produces a strong team which will require but li le legislation to place the dairy industry upon a roper footing.

Cost of Barns

an your men give us an idea as to the approxi- m e cost of a dairy barn as appears on cover of S tember 10th issue? The size appears to be ca- p le of caring for 50 to 60 head. The size we are i rested in is for 30 head.

'ennsylvania. SUBSCRIBER.

Building costs vary over such a wide range in d erent parts of the country that in order to esti- n te costs it is necessary to be familiar with local c ditions where the building will be constructed. T e complete cost is also influenced by the amount o modern steel equipment used such as stalls, car- r s, and ventilating system.

n some dairy sections it will cost approximately $ 0 per head to build a barn such as is shown on th cover of the Sept. 10th issue.

Slippery Concrete Floors

HOARD'S DAIRYMAN:—With reference to the i uiry of "A. M. W." and the reply by Mr. W. G. Kiser discussing the best way to prevent cows s ping on a concrete floor.

f "A. M. W." will obtain some ordinary ground li estone, unburnt and such as is applied to the la d, and daily, after cleaning out the cow barn, s inkle it finely so as to give a light covering over a the concrete floors, he will find that if he w hes, he can gallop his cows from one end of t barn to the other and he cannot make them s).

Besides this desired effect, the lime produces a c an white floor, is a slight disinfectant and de- o rant, and is a highly desirable fertilizer for the la d. If sawdust or shavings are used for bed- d g, the lime helps to neutralize the acidity.

f the spreading of the limestone produces a d t it can be slightly damped before using, and t cost is negligible in view of the many bene- fi derived.

Both chipping the floors and the use of acids to r ghen them are useless methods to prevent cows s ping besides doing away with a smooth surface w ich is very desirable for purposes of cleanliness.

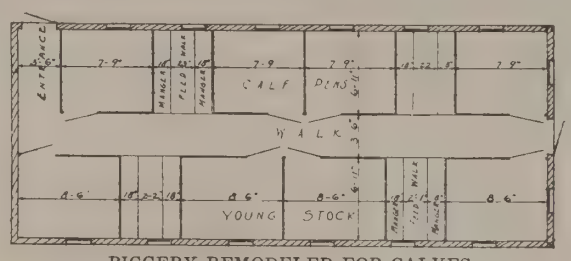
Vermont. F. KENDZIOR.

How Big is a Can

HOARD'S DAIRYMAN:—On page 927 of your O tober 10 issue is an illustration purporting to s w by figures and graphs the increase in various p ses of milk production and consumption in re- c t years. May I call the attention of the design- e of the graphs to the fact that the contents of s ds are to each other as the *cubes* of their like d ensions and not in a simple direct proportion? C the three milk cans shown in the graph, the s allest is labelled "80 million" and the largest "2 million," which is approximately a ratio of 2 o 3. But when the height and diameter of the c s each bear this same ratio, it makes the rela- t e capacities of the two containers to have the r io of 8 to 27; thus the graphic illustration indi- c es an increase of some 300 per cent whereas the fi res on the cans indicate an increase of only a ut 50 per cent. This same mistake appears in t other parts of the half-page illustration.

Michigan. C. H. YODER.

We are cognizant of the mathematical error n ed by Mr. Yoder. The charts were intended t emphasize to the eye something of the great i rease in milk consumption, a fact that would be d rlooked by many if the printed table only was u d. That there was no deception intended or c veyed is shown by the fact that the actual f res are given prominence and the eye itself will s rcely recognize the increase as being as large a it is.



We are always pleased to receive letters such a the above, because we take it as a compliment t have intelligent and critical readers. We would a preciate suggestions as to how similar illustrations and cartoons may be drawn in the future to better illustrate the statistical data given in the wonderful story of the advance of the dairy industry.

Arranging a Calf Barn

I have a building, used for a while as a piggery, that I wish to remodel into a calf barn. Inside measurements are 44'x17'. It has a concrete floor, is lined with matched lumber on sides and ceiling. All windows are 3-light, cellar windows set between studding, with window sill 4 feet from floor. There are six such windows on the east; a door and six windows on west; door and two windows on north.

I will appreciate it if you will suggest plan for calves and young heifers alone; and for these and a bull pen, if you think that it is advisable to include the latter.

Building rests on cement foundation; has studding, sheeting on outside, building paper, clapboards; with matched sheeting on inside of studding. Presuming that in a building made so tight that there should be systematic provision for ventilation, please suggest same. As means are rather limited, I shall appreciate it if you would suggest plans involving metal pens, and also those that can be home-made. I would like to have the general

PIGGERY REMODELED FOR CALVES

appearance of this calf barn somewhat above the ordinary, as I intend to use it as a show place in which to develop and show stock for sale.

Hay and bedding will have to be carried in daily as there is but little loft room.

Grayling, Mich. R. D. B.

A suggestion for interior arrangement is shown by the accompanying floor plan. This layout will accommodate a total of sixteen calves, four in each pen, and twelve young heifers, three in each pen. A walk 3'—6" wide at center makes it convenient to care for the stock. A small feed walk between feed mangers has been provided between two pens as shown by plan. This makes for sanitation as the pens can be cleaned without the litter coming in contact with the manger.

This plan can be carried out regardless of whether the pens are constructed of wood or steel. In view of the fact that you wish to have the appearance of this barn somewhat above the ordinary and will use it as a show place, we suggest the use of steel. If other quarters can be provided for the bull we believe it would be well to keep him out of this barn. As the bull should have a yard to exercise in and be permitted to run in and out, it requires an open door and this would not be satisfactory where small calves are kept.

Ventilation should be provided to insure plenty of fresh air which is necessary for animal health and growth. We suggest that this problem be taken up with the manufacturers of ventilating systems whose advertisements will be found in Hoard's Dairyman. They will make a study of the requirements and furnish the outfit which will give you the most satisfactory conditions in the barn which conditions permit.

Wisconsin. THOS. BURTON.

Sale of Tested Cows

While the purpose of the dairy herd improvement association is mainly to aid the member in bettering his herd production, the influence of testing on sales price is not without value. Mr. Geo. Weidmann had an average herd production of 381 pounds fat in the Thiensville—Lakefield Dairy Herd Improvement Association. He rented his farm and sold his 15 grade Holstein cows at auction last spring. These cows sold for an average of $161.83 each, and in practically every case the higher the cows produced the more the neighbors bid for the animal.

The same day at the same sale there were five cows brought into the sale ring that did not have any records. These five cows sold for an average of $80 each. As James Rezach, the tester, well says: "Leave it to the dairy herd improvement association; it will talk for itself."

It might be added here that "dairy herd improvement association" is the new name by which cow testing associations will be known hereafter. Some may regret the loss of a familiar name, but the new one is more expressive of the work that is being done. It is dairy herd improvement for which we aim, rather than mere records. It touches the whole farm. Crop rotations, feeding, health of cattle and their proper care, and a hundred and one other things are covered in what we formerly called a cow testing association. Now we must learn to use the new and more descriptive name—dairy herd improvement association.

Produce or Buy Milk for Retail Route

We are running a milk route of about 300 quarts daily besides a large amount of cream. Milk wholesales at 8c per quart and retails at 10c, coffee cream at 35c a quart and heavy cream at 70c a quart. We have 80 acres of good land and keep on the average 25 head of grade Holsteins. Figuring the cost, trouble to get good labor, money invested in cattle, and pasture outside costing us $10 per head, what do you think of our disposing of the cattle at $100 a head?

We are offered milk from two neighbors at 4c per quart. Milk will test 3.5% and will be cooled and handled O. K. in cans. We would separate this milk to get our needed amount of cream, the rest to be bottled.

Which plan would be the most profitable? We have had this amount of cattle for over eight years and would like to hang the milk stool up for one year, at least, allowing us time to do our own farming.

Ludington, Mich. W. E. M.

It is always difficult to advise a person as to the relative profits it is possible to secure from a given enterprise on the farm. The costs of producing milk vary from farm to farm according to a number of factors and it is unsafe for any individual to base a decision upon what might be termed average costs. This variation in costs of production is due to the varying producing abilities of the cows, the economy with which they are fed, the cost of feed and labor, and the type and amount of investment in barns and equipment. These are all variable factors and the only safe procedure is to take all these into account on a given farm.

If the feed cost of producing milk is known, one can roughly estimate what the total cost of milk production may be. Investigations indicate that the feed cost of producing milk will range from 50 to 70 per cent of the total cost of producing milk. If there is not an extravagant investment in buildings and the labor costs are not unusually high, we anticipate that in this case the cost of feed for producing milk will more nearly approach 70 per cent of the total cost of milk production than 50 per cent. In other words, if the feed cost of producing 300 quarts of milk is, say, $7.00, the total cost would be $10.00 if the investment in equipment, etc., is moderate and the feed cost amounts to 70 per cent of the total cost. If the feed cost is 50 per cent of the total cost, then the total cost would be $14.00 for 300 quarts. It can be seen from this example showing a variation from 3⅓ to 4⅔ cents per quart in the total cost of milk production that it would be difficult to make any definite statement unless one had a pretty complete statement as to the items entering into the particular costs. Please understand that these figures do not necessarily apply to the case presented, but are merely illustrative.

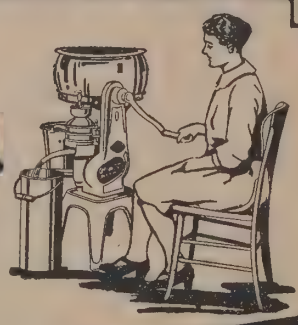
At 4c a quart the neighbors would be receiving a fair price for their milk, particularly when it is taken into consideration that they will have practically no cost for the delivery or transportation of their milk. The question arises, however, if these neighbors can produce milk at this price and still make a profit, would not a retail dealer already equipped be able to do the same? Also, if one were to make the change he would want a reasonable assurance that his neighbors would maintain the same quality of milk that he has maintained and that their supply would be not only of this quality each day of the year but also that he would be assured of all the milk he required for his trade and yet would not be burdened at certain periods with a surplus that he might have to sell at a lower price than he pays.

Another factor that must be taken into consideration is the profitable and complete employment of the labor required to operate the milk business and the farm. It is quite possible that merely eliminating the cows will not necessarily permit cutting down the employment of labor sufficiently to enable the complete time of the labor being used. It is always a very important factor in farm profits, as well as in every other business, to keep the labor that is required profitably employed. Another factor that must be considered is whether a profitable market for the crops of the farm will be found if they are not sold to the cows on the farm.

MINNETONNA
HOME BUTTER MAKER

A WONDERFULLY efficient butter making machine built on the same working principles as the machines used in large creameries, differing only in size and price.

It gets all the butterfat out of the cream. It churns rapidly so the butter comes in from one-half to one-fourth of the time. By simply throwing in clean water and giving a few turns, you remove all buttermilk. Instead of working the moisture *out*, the MINNETONNA works the moisture *in*, so necessary to the flavor and the keeping qualities, and giving an "over-run" (of moisture and salt) of from 20 to 25 per cent above butterfat test. Hence *more* and *better* butter.



Churning capacity 3 to 12 gallons. Working capacity 3 to 20 lbs. Larger sizes up to 100 lbs. capacity.

EASY OPERATING
CREAM SEPARATOR

Five features (ball bearings, chain drive, complete lubrication, high crank, and low swinging tank) make it very easy to operate the

Rock Island
"Great Western"

Realizing that most of the cream separating is done by women on the farm, exceptional care has been taken to make the Rock Island easy to operate. Equipped with ball bearings where most essential. Ball bearings reduce friction to the minimum.

The chain drive is most simple. The chain follows its track on the sprockets with practically no friction or binding, runs at a very low speed, requires less lubrication, and operates the separator smoothly, easily and quietly. Chain is entirely enclosed and guaranteed forever against breakage.

Complete lubrication is obtained by a combination direct feed and splash system. All moving parts are plentifully supplied with oil at all times. Faultless lubrication means less friction, ease of operation and long life.

The crank is in exactly the right position so the Rock Island can be comfortably turned with the operator in either a standing or sitting position. The low supply tank reduces lifting of milk to a minimum and is easily moved aside.

These features, and the famous skimming device that takes the cream from the top and milk from the bottom, are explained in our free booklet. Write today for booklet C-104.

Elimination of Feed Flavors

A. M. LOOMIS, WASHINGTON, D. C.

THE active efforts of doctors and dietitians in behalf of increased use of milk and dairy products and the work of the dairy industry itself, toward larger sales of their products, have brought about the necessity on the part of the dairymen of supplying a product which of itself attracts favorable attention. No food product can maintain a high place in competition which does not appeal to the taste, and no food product is more subject to off-flavors and off-odors than milk and its products.

This is entirely aside from the matter of purity and safety from the health standpoint. The public will and does assume that an off-flavor product is intrinsically bad, whether it is or not; and therefore the elimination of bad flavors from milk has become a factor of nearly the same importance as sanitation in bringing success to the numerous campaigns to increase its use.

Causes of bad flavor and noticeable odor in milk have been classified by those working on these problems in four classes: those due to poor physical condition of the animal, those due to highly flavored feeds, those due to odors absorbed after milking, and those due to biological changes in the milk. The first two are noticeable immediately after milking and are very closely subject to the control of the dairyman himself.

If the cow is in poor condition, resulting in off-flavored milk, the remedy is either the veterinarian or the butcher.

If the off-flavor is due to highly flavored feeding material or to weeks in the pasture, then the dairyman can accomplish a large measure of relief by himself. The research men have found that for the most part this kind of off-flavors comes through the body of the cow, not through the air of the milking barn as has generally been supposed.

Corn silage, legume silage, green alfalfa, turnips, and cabbage are among the worst offenders. It is found that if milk is drawn from the cow within one hour after she has eaten these feeds, the milk will carry the off-flavor. After one hour it is comparatively free from these flavors. The feed tainted air has comparatively little influence on the flavor of the milk, but milking within one hour of feeding must not be done.

Green rye, green cowpeas, potatoes, beet pulp, or carrots give but slight flavor to the milk. A brief interval between feeding these and milk usually makes the milk free fr trouble. Green corn, green oats peas, pumpkins, and sugar beets n be fed at time of milking with trouble, according to these investi tions.

None of these feeds, if fed af milking, show any bad results in next milking.

Of all causes of off-flavor, garlic the worst. Careful study has b given this subject with such a dea of results that remedial measures the main must be confined to eli nating the weed from the pastures. a cow inhales the odor of garlic, m drawn two minutes later will cont the taint. Milk drawn at any ti within four hours after a cow eaten garlic, will be intensely impr nated with the odor. It will persist perceptible amount for three hours seven hours after the eating. That milk must be drawn more than se hours after a cow has grazed in a g licky pasture in order to be presum to be free of the odor.

The odors absorbed after milk include those from barn tainted and those coming from dirty, unsa tary surroundings, gas or oil fum or accidental contamination. M dairymen understand the necessity keeping their product free and cl from such conditions.

Biological changes in the milk self, except in rare cases, are preve ed by prompt cooling and proper ca

The investigations of the resea men of the Bureau of Dairy Indust conducted at the Beltsville Stati show conclusively that the feed od and flavors discussed here are tra mitted through the stomach and lu walls direct to the blood, then throu the mammary glands to the milk self, and, as indicated by the ga test, that this transmission is a m ter of minutes only.

Elimination of weeds from pastu is one of the big problems. Very lit actual field work has been done test out methods of weed eliminat using results of modern chemical a technical research. This is a field research of value to the dairy ind try which needs more thorough ploration.

When Edith and Alexander we engaged she said: "I just love to s you smoke that pipe!"

When Edith and Alexander we married she said: "I'd just like to s you smoke that pipe!"—Life.

Langwater Archer was the highest priced animal at the recent Fairydale Guernsey dispersal. This 9-year-old May Rose sire was purchased by E. F. Price, New York, for $4,200.—H. A. GULLIVER.

for Christmas

Twenty complete Christmas Stores in your Montgomery Ward Catalogue

You can visit twenty complete Christmas Stores by merely turning the pages of your Ward Catalogue. A jewelry store, a complete toy shop, a dry goods store, everything twenty complete Christmas Stores can offer is to be found in your Ward Catalogue.

You can find gifts for every friend, every member of the family. You can choose at your leisure, and more important you can secure three gifts for the price of two elsewhere. Because—

There are no Christmas Profits in Montgomery Ward's Prices

Ward's prices on Christmas goods are all-the-year-round prices. There are no Christmas profits added. You can buy your Christmas gifts at Ward's at regular prices.

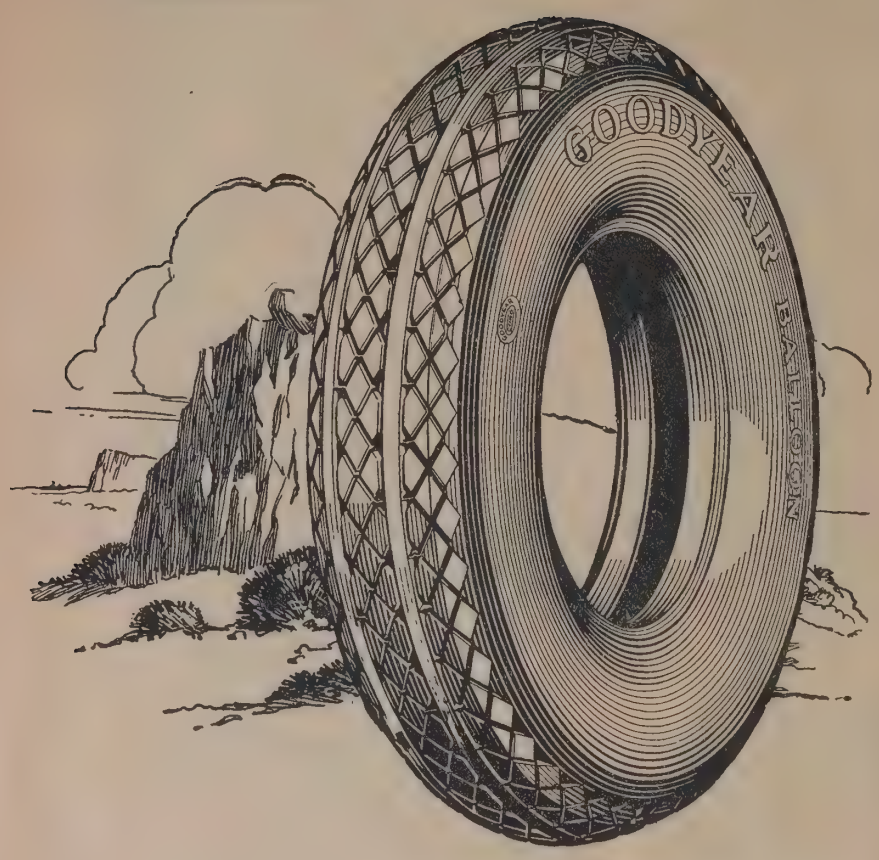
Thus your Christmas savings are almost doubled if you use your Ward Catalogue for every Christmas gift. Ward's Catalogue is a Christmas Gift Book. It is a dictionary answering every Christmas question of "What to Give." Merely to study its pages, and to turn through the index will help you solve every Christmas problem.

There are gifts for the children, a big assortment of Christmas toys, articles of jewelry, books, everything you can find anywhere for the boy or girl or infant.

Everything a man uses or wears, everything a woman needs or wants, is offered at regular all-the-year-round prices.

Remember Christmas is Just Around the Corner

The days slip by quickly. Start today making your Christmas list. Order early. Take full advantage of the big savings Ward's Catalogue offers you at Christmas time.



Quality is especially important in a Christmas Gift. At Ward's the quality, the reliability of every article is absolutely guaranteed.

ESTABLISHED 1872

Montgomery Ward & Co.

Chicago Kansas City St. Paul Baltimore Portland, Ore. Oakland, Calif. Fort Worth

If you want extra traction and long tread wear in addition to balloon tire comfort, be sure you get this quiet-running *new-type* Goodyear All-Weather Tread

"Let's look at it!"

Most of us like to *see* what we are buying, whether it be tires or anything else.

You can do that when you buy tires of your home town Goodyear dealer; he has *your* size in stock where it can be examined before you pay.

He will recommend the size and type of Goodyear Tire that is best for your car. He will mount that tire on the rim for you, and fill it with air.

All the time that tire is in your use he will help you give it the care it should have to deliver you the maximum results.

This service of the Goodyear dealer will prove a time-saver and money-saver for you. Test it once and see for yourself.

It is part and parcel of the traditional Goodyear policy: *to build the greatest possible value into the product,* and *to provide facilities so that users will get all that value out.*

Goodyear makes a tire to suit *you*—whether you want the incomparable All-Weather Tread Goodyear, the most famous tire in the world, or the lower-priced standard quality Goodyear Pathfinder

Death of Oldest Guernsey

GUY A. PETERSON, WISCONSIN

TRICKSEY'S Arabella, until her recent death, was the oldest registered cow in the Guernsey herd book. Her passing at the age of 20 years, after giving birth to 20 healthy calves, 19 of which are recorded in the register, marks the end of a long and faithful service to the cause of dairying.

Bred by William Jones and owned by George Kiel of Wisconsin from the time she was one year old until her death, she not only founded Kiel's pure-bred herd, but her descendants have been the foundation female animals in a number of neighbor herds. County Agent Robert Smith once made the remark that close to a half of the pure-bred breeders in Manitowoc County have animals in their barns that trace to this grand old cow.

Remarkable Show Yard Record

Probably no cow in Wisconsin can equal the record of Tricksey's Arabella as a local county fair show winner. For ten years she was never defeated in her class at the Manitowoc fair. One of her daughters followed in her footsteps and captured championship honors for the next three years and she in turn was s planted by a granddaughter who v first place in her class every year was shown for seven years. She her offspring have captured a b ribbon and either one or both of championship female honors at t fair every year since 1908.

The herd that Tricksey's Arab founded has had only one year's portunity to be in a cow testing as ciation because not enough neighb could be induced to join, but its av age fat production that year was lbs. She herself has an A. R. recor 387 lbs. fat and 9,578 lbs. milk class AA made as a 14-year-old i year when she suffered with a seri attack of udder trouble. Her most mous daughter is Tricksey's Gl wood Girl with a high Illinois cl record of 800 lbs. fat and 15,359 milk. She sold at the Lake For sale in 1913 for $1,000.

Arabella's end came soon after g ing birth to her 20th calf as a res of acute garget and general wea ened condition due to old age. She will long be remembered by her ow er as well as by the many who h benefited by her life. There are s seven generations of her offspring the Kiel herd.

GEORGE KIEL AND HIS OLDEST 4-H CLUB BOY, LESTER, WITH TRICKSEY'S ARABELLA AND HER 19TH CALF, TRICKSEY'S PRIDE OF CRYSTAL SPRINGS

Ice Cream Plant on Dairy Farm

HOARD'S DAIRYMAN:—The dairy cow is proving that France's famous wine lands are good for something besides producing wines. This process is described by J. L. Keith, an American and a graduate of the University of Idaho, who is now manager of the largest ice cream manufacturing plant on the continent.

The plant, operated by Sampson Tchernoff at Saint Laurent, near Bordeaux, is in the heart of a section famous for several brands of fine Claret wine. In this congested territory, hitherto believed suitable only for wine production, Mr. Tchernoff bought nearly 1,000 acres of old vineyards and waste land. He has cleared the land, pulled up most of the vines, and converted it into an up-to-date dairy farm.

M. Tchernoff apparently is more completely sold on American methods than American farmers themselves. His enterprise is revolutionary in a region where farming is still carried on by hand or with oxen and two-wheel carts. He has spared no expense.

All power is furnished by tractors and electric motors. The farm has its own electric power plant, its own water system, electric light system, and machine shop.

All cattle and hogs are pure-bre The few horses are fine Percher and the chickens, turkeys, and du are the best that can be secured.

Two new cow barns (100 co each) are equipped with mod stanchions, feed and manure conv ors, and ventilators.

M. Tchernoff employs scient methods as well as machinery. I instance, he uses a "soiling syste —cutting and bringing feed to cows instead of pasturing them. the last six years he has built the soil until he gets 120 bushels corn to the acre, 20 tons of corn lage to the acre, and grows oats feet high. "If I hadn't seen some his oats I couldn't believe this l one," Keith writes, "but it's true."

The ice cream plant of which Ke is in charge is built to manufactu a million gallons a year. Tcherni plans, however, to make only w he can from the milk produced the place, which will be about 5 gallons daily. By 1930, he sa there will be 10 cow barns instead two.

Keith, who took his Master's d gree at Idaho University in 19 went to France in March after bei selected from a list of more than 2 applicants.

Idaho. ALAN DAILEY

CHEVROLET

Over 3,000,000 Miles of Testing

The General Motors Proving Ground, at Milford, Michigan, is the greatest outdoor laboratory ever devised for testing automotive products.

Here, over roads and hills of every type, Chevrolet cars are driven day and night—through zero cold and blistering heat. Already, Chevrolet cars have traveled more than 3,000,000 test miles on the Proving Ground roads—

—three million miles of harder, rougher, faster driving than a car would ever receive in the hands of any owner!

And that is the reason why Chevrolet quality stands supreme in the field of low-priced cars—

—why every feature of Chevrolet design is proved before it is offered to the public—

—why Chevrolet performance and comfort and driving ease are the finest ever offered in a low-priced automobile!

Go to your Chevrolet dealer—and make your own inspection of Chevrolet quality. Then you'll know why millions have acclaimed Chevrolet as the world's finest low-priced car.

QUALITY AT LOW COST

Quaker Dairy Rations *mean* MILK PROFITS

Quaker Dairy Rations insure maximum milk production at minimum cost. Our recommended methods of feeding prescribe this important advice:

"Feed the Feed that Fits Your Farm, Your Herd"

Which of these feeds is the one for you?

Quaker Boss Dairy Ration is the ideal **24%** grain ration for cows receiving timothy hay, grass hays, straws, corn stover, or poorer grades of clover.

Quaker Big Q Dairy Ration exactly **20%** meets the need of those herds receiving poor alfalfa hay, fair clover hay, or real choice mixed clover and grass hay.

Quaker Dairy Ration has no superior **16%** when cows are receiving choice clover hay, good alfalfa hay, or an excellent grade of fine mixed grass-and-clover hay; a good ration for dry stock and for young growing stock.

Quaker Sugared Schumacher Feed, as the exclusive grain ration, has a real place when the herd is receiving liberal quantities of the very best grade of alfalfa hay. For blending it combines beautifully with any Quaker high protein feed. For all stock—dry stock, horses, sheep, swine and steers it is unexcelled.

All Quaker Dairy Feeds contain molasses in dried form and are rich in the minerals cows must have to make milk.

Send for the FREE book—"The Dairy Herd," for detailed information. It tells you just how to meet the feed requirements of your farm, your herd.

A Neater Herd Book

HOARD'S DAIRYMAN:—I have already adopted as a New Year's resolution, "I will compile a neater and better herd book the coming year." I recommend it to other testers for adoption at any time, but preferably at the beginning of a new year for their own dairy herd improvement association.

Last year was my first year as a Michigan cow tester. In looking over the different herd books I found there were three prevailing reasons for bad looking books on my part.

In the first place I used the same pen for both the blue and the red ink I used in making entries monthly and the totals to date. The result was a blend of ink. To avoid this trouble I will have a certain pen for each ink.

In the second place I discovered I was not blotting my work thoroughly. There is nothing like having a good supply of blotters on hand and using them.

In the third place, and probably the most important, there were mistakes in adding and failing to correct them in time. Often the mistake was near the top of the page. Although amounting to just a few cents the whole column must be changed. To avoid this I have been okaying my books. Every three months I checked to see if the totals were correct. When found correct I put O.K. with red ink in the remarks columns, opposite total. With th method I can get the mistakes befo they get the best of me.

We must also bear in mind that ca fulness will go a long ways in maki a neater and better herd book.

W. G. KIRKPATRICK, Tester.

Rinsing or Washing

HOARD'S DAIRYMAN:—"It's gettig cooler now. We'll not bother abo washing the pails tonight; just ta them over by the pump and rin them out good."

How often this expression has be made, not only in regard to the m pails but all other utensils, such s the cooler, strainer, and separator.

A tester in a local cheese facto near Portland, Oregon, recently sa "Last month we threw away 8,0 pounds of cottage cheese because t was spoiled. On close inspection e found that the milk we were buyi was causing this. I took a sample f each shipper's milk after it w weighed here at the factory a placed the samples tightly corked in hot water bath. At the end of seve hours some of the samples of m turned to a solid curd but the n turned to whey or had begun to tu consequently we learned who w shipping the poor milk.

"I went out that afternoon to d cover the trouble. The first place came to they had just finished mi ing and had the pails rinsed out. I

*Includes dry cows. †Retest rules followed.

to: my scraper and ran it along the se ns and sides of the pails and fo nd that thin layer of fat which is al ost invisible to the naked eye but w n placed under a powerful micro- sc pe is found to be alive with bac- te a that cannot be rinsed out with co water but must be scrubbed with a trong washing solution and then th roughly scalded with water of not le than 185°F., and the hotter the bo er. Some of the bacteria which a left to grow along the seams and si s of milk utensils are of the worst ki l and pasteurization will not de- st y them. They must be kept out fr n the start."

e also showed how the bacteria sp led the sale of the cheese; it gave th cheese a very bad odor, which if on the market for public inspec- ti would have done more damage to th r reputation as expert manufac- tu rs of pure cottage cheese than fi times the price of the 8000 pounds w ch they threw away.

Vouldn't it be much better for all co cerned to use a little cleaner m hod of producing milk?

A. W. BADGER, Tester.

Cow Testing in Illinois

n January 1, 1927, there were tw nty-eight dairy herd improvement as ociations in Illinois with 12,198 co s, owned by 700 dairymen, under te . The 8,851 cows on which a re- pit for 1926 was secured, averaged 7,.6 pounds milk containing 288 p nds fat. The average feed cost p cow was $77.53 and the average re rn above feed cost was $110.12.

n their annual report, Messrs. R de and Brock state that the aver- a cow in dairy herd improvement w k produced 72 per cent more milk th n the average cow in Illinois. The m which represents the difference in p duction between the 12,198 cows a compared with a like number of a rage yield dairy cows would be w th $776,036 at $2.00 per hundred p nds.

ne member of the Will County N nber 2 Association changed his fe l from an expensive prepared ra- ti to a home-grown one of ground o s, ground corn and cob meal, and li eed meal. By doing this he cut th cost of the feed 20 per cent, in- cased the production over 11 per c t, and increased his returns over th previous month nearly 48 per c t.

nother member was able to re- d e his feed cost 77 cents per cow d ing one month by changing to the a ised ration of corn, oats, bran, and oi meal, instead of a ration contain- in only corn and oats. His returns f one dollar expended for feed were al increased from $1.88 to $2.73.

n the Montgomery—Macoupin As- sc ation one member changed his ra- ti from corn alone to corn, oats, b n, and oil meal, and secured an in- cr se in production of 20 per cent. T high herd in the Will County N nber 1 Association had an abun- d ce of sweet clover pasture and w fed grain according to the in- st ctions given on the feeding chart w ch was left by the tester.

ne herd was receiving a poorly b anced ration and the value of the p duct was $65.00 less than the feed b . After changing to a balanced r on and feeding according to pro- d tion the herd during the second m nth showed a profit of $25.00 and o of $113.00 during the third month w h three less cows.

When the Moultrie County Associ- a n was first organized, many mem- b s were feeding 18 to 20 pounds of e corn regardless of production. U der this system during April one h d returned $3.50 over the feed cost a produced a pound of butterfat at a eed cost of 43 cents a pound. By changing to a balanced ration and feeding according to production, this herd returned $800.00 over feed cost for the year and reduced the feed cost of butterfat to 17 cents a pound.

One of the members who doubted the value of balanced rations and was of an experimental turn of mind, proved to his own satisfaction that his theory was wrong. He fed two of his cows a balanced ration while he fed the rest according to his old feeding ideas. The two cows with the opportunity averaged 7,056 pounds of milk, 394 pounds of fat, and a return of $107.74 above feed cost. The other cows in the herd averaged 5,120 pounds of milk, 279 pounds of fat, and $70.07 above the cost of feed.

6000 Herds in Honor Roll

More than 6,000 dairy herds are now included in the National Herd Honor Roll created by the National Dairy Association. This is an increase of 1,000 herds over last year. Herds of five or more cows which have produced at least 300 lbs. of butterfat per cow a year are eligible for the Honor Roll.

Wisconsin again leads the nation this year with approximately 1,400 herds, an increase of more than 175 herds. Michigan has 1,078 herds. Minnesota had 538 herds in 1926. This year the state has 659. Ohio jumped from 191 herds to 258 this year. Washington did not have a herd listed last year. This year the Apple State has registered 88 herds. Pennsylvania jumped from 335 to 426 herds. Idaho gained 38 herds. Massachusetts lists 70 herds this year against 9 in 1926.

Virginia predominates among the southern states with 105 herds, an increase of nearly 100 per cent over last year. Georgia has six herds.

Cow testing associations fostered by the National Dairy Association have been responsible for the growth of the Herd Honor Roll.

The Boss: "Robert, I hope you try to save half of what you earn."

Office Boy: "I don't get that much, sir."

New Batteries will make your Light Plant New!

For every make of plant

You can have plenty of lights and plenty of power—all the convenience your light plant was built to give—if *you* give *it* strong dependable Universal "Nu-Seal" Batteries to work with.

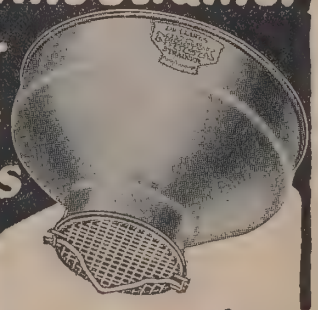
Less care—long life

Big sediment space, visible charging gauge, extra thick plates, fewer fillings—all this saves you trouble, insures long life. "Nu-Seals" cost you no more now and much less in the long run.

For EVERY plant

These batteries—the *original* sealed glass cells—are made in every size and capacity for every light plant ever sold!—Yours! Any!

Battery Guide FREE



Big free book that tells you how to care for all batteries. We make farm light, radio and auto batteries for *every* purpose—this book gives you our expert advice. Send for it. And remember there's a good trade-in allowance on your worn-out batteries. Ask for it—today!

Senior and grand champion cow—June's College Girl. Junior champion cow—Maiden of Meadow Green.

The Jerseys

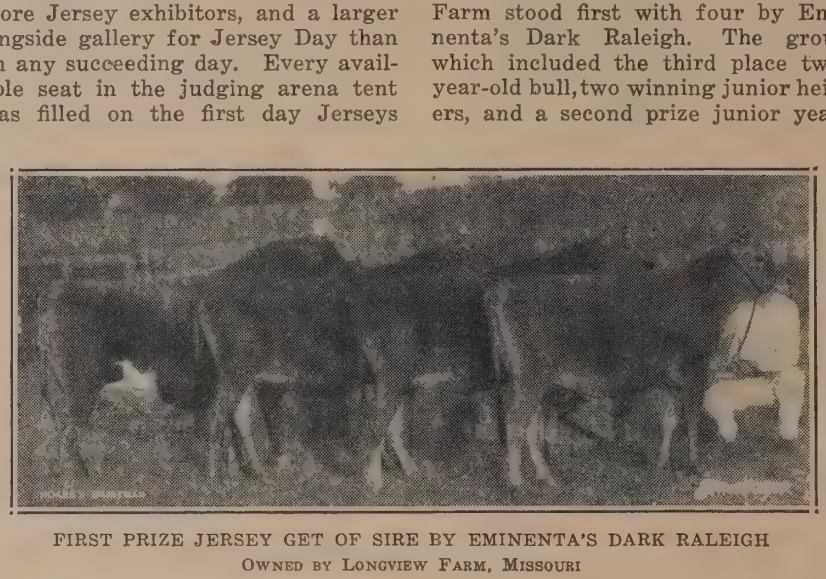
Judge: J. B. Fitch, Kansas.

We had always heard that the Jersey cow ruled a popular favorite with the dairy farmers of the South and after National Dairy Show week this year, we believe that statement must be true. There were more Jerseys exhibited at Memphis than there were representatives of any other breed, more Jersey exhibitors, and a larger ringside gallery for Jersey Day than on any succeeding day. Every available seat in the judging arena tent was filled on the first day Jerseys were judged. They came early and most of them stayed until the judging was completed at 5 o'clock. More than that it wasn't just a crowd of spectators, it was an interested crowd that made its likes and dislikes in the matter of placings known.

Two hundred and fifty-eight Jerseys from fifty-eight different herds in thirteen states gave Judge Fitch a busy two days and while, as always, some of the entries weren't quite up to standard, it was a splendid show.

The Twin Oaks herd from New Jersey has for several years been showing winners especially in the bull classes and Bob Callender, who has charge of the herd, didn't disappoint his friends this year. He didn't do so well in the calf or in the 2-year-old class but in the other four he held number one position without much trouble, and both bull championships were won by his entries.

In the two-year-old class the first prize winner at Eastern States, a Twin Oaks entry, went down to sixth. This wasn't so much of a surprise, but some spectators looked to see the Longview entry or one from The Oaklands crowd the son of Fern's Wexford Noble from Crieve Hall Farms a little harder for first place. At some of the earlier shows we believe at least one of these contenders has placed above the Tennessee bull.



The winning three-year-old, Oxford Wexford Noble from Twin Oaks, will be remembered as last year's grand champion. He was a good winner this time but he wasn't good enough to beat the 7-year-old Fern's Rochette Noble, another son of Fern's Wexford Noble, for senior championship. The aged bull is a wonderful bodied, good lined bull that was in the best of show shape on show day.

The aged cow class with 25 entries was the second largest class of Jerseys shown and it was just about the easiest class from which to select the winner, for even among twenty-five, most of them good ones, Crieve Hall Blonde's Segunda was outstanding. She has been undefeated so far this year and we haven't seen one for a year or two at least that we think could beat her.

Crieve Hall Farms won again in the 4-year-olds, but after that they couldn't get better than third in the female classes. The Oaklands won with their 3-year-old daughter of Imp. Forward and Twin Oaks and Longview divided the remaining four blue ribbons equally.

The aged cow was an outstanding senior and grand champion and Longview's senior yearling was junior champion.

In the get of sire class Longview Farm stood first with four by Eminenta's Dark Raleigh. The group which included the third place two-year-old bull, two winning junior heifers, and a second prize junior year-

FIRST PRIZE JERSEY GET OF SIRE BY EMINENTA'S DARK RALEIGH
OWNED BY LONGVIEW FARM, MISSOURI

ling, were no doubt entitled to their place especially with their single class placings to be considered, but from the side lines we rather preferred the more mature get by Fern's Wexford Noble. It included the grand champion bull, the first prize three-year-old, and two two-year-old heifers.

The awards follow:

Bull 4 years or over—1, Twin Oaks on Fern's Rochette Noble; 2, Wardmere on Blonde's Oxford Baron; 3, Oaklands on Blonde's Xenia Sultan; 4, Morrison on Raleigh's Farmer's Glory; 5, Douglass Bros. on Silver's Fauvic. Bull 3 years, under 4—1, Twin Oaks on Oxford Wexford Noble; 2, Ashland on Butter Boy's Bright Prince; 3, Bonnell on Sybil's Lustrous Lad; 4, Duntreath on Raleigh's Bright Sultana; 5, Oaklands on Oxford's Sleeper's Nap. Bull 2 years under 3—1, Crieve Hall on Bermuda Wexford Noble; 2, Berry Schools on Sydonie's Noble Raleigh; 3, Longview on Fairy's Eminent Raleigh; 4, Cohn on Noble Jolly's Silver Medal; 5, Trost on Oxfonde Noble.

Cow 5 years or over—1 and 4, Crieve Hall on Crieve Hall Blonde's Segunda and Crieve Hall Dreamer's Fairy; 2, Twin Oaks on Rower's Golden Starlight; 3, Oaklands on Oakland's Roella; 5, Longview on Lady March Fern P. Cow 4 years, under 5—1, Crieve Hall on Volunteer's Nurse Segunda; 2 and 3, Oaklands on Lady of Broadfield Imp. and Rosebay's Finance; 4, La. State Uni. on Eminent's Raleigh Flora; 5, Biltmore on Raleigh's Ever Eminence. Cow 3 years, under 4—1, Oaklands on Forward's Paradise; 2, Twin Oaks on Bowlina's Xenia Lass; 3, Crieve Hall on Brampton Mary; 4, La. State Uni. on Jolly Majesty's Lady Bell; 5, Berry Schools on Jolly's Bisson Belle. Heifer 2 years, under 3—1, Twin Oaks on Design's Oxford Pride; 2, Oaklands on Brampton's Successful Lass; 3, Longview on Imp. Sunbeam's Clipper; 4, Crieve Hall on Crieve Hall's Rainbow; 5, Berry Schools on Leda's Jolly Brown Girl.

Get of Sire—1, Longview on Eminenta's Dark Raleigh; 2 and 5, Twin Oaks on Fern's Wexford Noble and Imp. Fern's Oxford Noble; 3, Oaklands on Imp. Forward; 4, B Schools on Leda's Whitehall Raleigh. Pro of cow—1, Crieve Hall on Royal Carus S.; 2 La. Uni. on Best Clemence of Leigh 3, Twin Oaks on Warder's Briar Rose; 4 5, Longview on Chief Raleigh's Dairymaid Dairylike Ceres. Young Herd—1 and 5, L view; 2, Twin Oaks; 3, Oaklands; 4, B Schools. Dairy Herd—1, Crieve Hall; 2, lands; 3, Longview; 4, Bonnell; 5, La. Proven Sire Class—1, Bonnell; 2, Cohn; 3, Uni.; 4, Shuford. Eight animals entered state breeders' Asso.—1, Tennessee; 2, M gan; 3, Missouri; 4, Georgia; 5, Ohio.

Senior and grand champion bull—F Rochette Noble. Junior champion bull—F Signal of Oaklands.

Senior and grand champion cow—C Hall Blonde's Segunda. Junior champion —Dark Raleigh's Rose.

The Guernseys

Judge: John S. Clark, New Y

John Clark had the best Guern show of the year, and one of the b we've ever seen, to pass on at M phis, October 20—21. There w 190 Guernseys there and except one or two classes, the tops and near tops were exceptionally g ones.

The aged bull class, while v good, wasn't so interesting as might otherwise have been beca the three best entries, Border King Roberts owned by The Larsen C ing Co., Shorewood Resolute fr Emmadine Farm, and May R Cherub owned by Mrs. Chauncey Cormick, have met so often dur the past three seasons that the sp tators are beginning to mark th catalogs ahead of time in antici tion of the judge's placings. course sometimes those who do have to look for an eraser, but wasn't necessary at Memphis. three bulls placed as named, Ju Clark giving the Wisconsin bull cr it for a better head and better spr of rib and criticizing the more sty Illinois entry for being too thick not sufficiently good on top.

D. D. Tenney's Cherub's Golden cret of Shorewood finished his sea an undefeated three-year-old Cherub's Yank of the Prairie ow by W. W. Marsh headed the t year-olds. Neither bull was su ciently good to beat the aged bull senior championship.

Emmadine Farms showed the j ior champion, a senior yearling of Shorewood Resolute, and the younger bull classes were won Aiyukpa entries from New York.

In the female classes W. H. W liams' entries pretty well monop lized the blue ribbons, taking th all but one. They showed no thr year-old heifer.

Shuttlewick Levity headed about the best aged cow class we e saw. She of course is in a class herself,—a really wonderful cow, she was by no means the only g

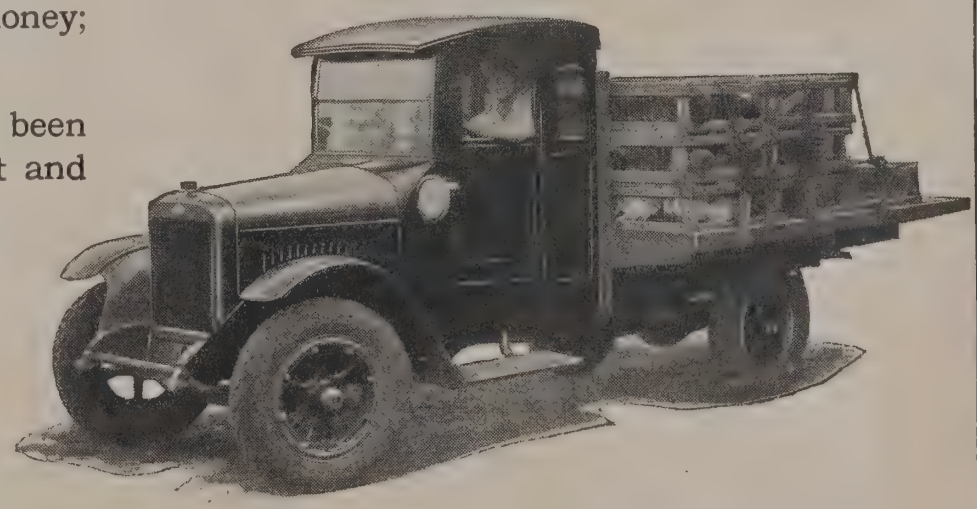
CRIEVE HALL BLONDE'S SEGUNDA, SENIOR AND GR CHAMPION JERSEY COW, WITH FRANK BARTON FARM MANAGER, AND MR. AND MRS. HERBERT FARRELL, OF TENNESSEE, OWNERS

The Farmer Is the Biggest Truck User!



MOTOR trucks everywhere and the farmer leads all other groups. The National Automobile Chamber of Commerce has just published figures to show that farmers own over 248,000 trucks and the next group has a hundred thousand less.

That shows the spirit of farming in the U. S. A. The farmer needs fast, time-saving, economical hauling and he invests in the good motor truck. He has loads and loads of every description to haul, the year around, and hundreds of miles to go. His time is money; he cannot afford to waste it on the road.

International Harvester Trucks have been cooperating with the farmer to his profit and satisfaction for many years. In every county the nation over International trucks are relied on. They come in any size any man might need, from the ¾-ton Special Delivery and the Speed Truck line up to the 5-ton Heavy-Duty Truck, with bodies for every kind of farm hauling. As for service, remember our 136 Company-owned branches in the United States. The service Mr. Rockne speaks of in his letter is the same as you will get anywhere.

Write us for an International Truck folder which gives full details about the line.

And the Careful Farmer Sticks to
INTERNATIONAL TRUCKS

From a Stockman

Mission Hill, S. D.
Aug. 26, 1927

Gentlemen:

We are boosters for the International Harvester Company. We have three International Trucks in use all of the time. These are stock trucks and are run from here to Sioux City, a distance of about 140 miles round trip, and we find they stand up wonderfully. The service one receives at their place of business in Sioux City is of the very best.

The letters, "I. H. C.," it seems to me, might fittingly stand for Industry, Honesty, and Courtesy.

Yours truly,
O. D. Rockne,
Mission Hill, S. D.

From a Dairyman

Caldwell, Idaho
Aug. 17, 1927

Gentlemen:

Under separate cover we are mailing you a picture of our fleet of International Trucks. (See illustration above.)

You will recall that we have purchased fourteen Internationals from ¾-ton to 1½-ton capacity, and I take great pleasure in telling you that in my thirteen years of experience in hauling cream with motor trucks, I have had more satisfaction with the International Trucks than any other make we have used. I might say we have standardized entirely on your equipment.

Yours very truly,
J. R. Brown, Manager

Nov. 29-30—National Creamery Buttermakers' Association, Nicollet Hotel, Minneapolis, Minn.

Jersey Fieldman for South

Prof. J. W. Keegan, formerly at Clemson College, South Carolina, has been appointed field representative for the American Jersey Cattle Club in the states of Mississippi and Alabama.

Widow: "If poor John had only made a will there would not be all this difficulty about the property."

Visitor: "Do the lawyers bother you?"

Widow: "Bother me? They almost worry me to death. I sometimes almost wish that John hadn't died."—Exchange.

Black Goes East

Harvard University is extending the scope of its instruction in farm problems and agricultural economics by adding to the faculty one of the foremost authorities in that field, Professor John D. Black, who has been chief of the Division of Agricultural Economics in the University of Minnesota since 1920.

An extensive research program is contemplated under the direction of Professor Black. Harvard is peculiarly qualified to undertake research-

PROF. JOHN D. BLACK

Who has resigned as chief of the Division of Agricultural Economics in the University of Minnesota to teach Agricultural Economics at Harvard University.

es having a national scope, Professor Black says, because of its character as a national university.

Professor Black was born on a farm in Jefferson County, Wisconsin. He was graduated from the University of Wisconsin in 1909, and received his Ph. D. in 1918. He has taught at Western Reserve University, Cleveland, O.; Michigan College of Mines, Houghton, Mich.; University of Wisconsin and the University of Minnesota. He built up the department of agricultural economics at the University of Minnesota from two graduate students to fifty, the largest in the country. Men trained at Minnesota are now teaching and doing research work in agricultural economics in 23 states and several foreign countries.

Soil Management

The second edition of Firman E. Bear's book on Soil Management is ready for distribution. The book is intended primarily for use in beginning courses in soils in agricultural colleges, in which many of the students are not interested in the more technical phases of the subject and have little or no need for the course except as it may be useful to them in making practical application of the solution of problems of soil management. Old material has been revised where necessary and new material added. Copies of the book may be secured from Hoard's Dairyman Book Department on receipt of $3.50 per copy.

Try This on the Cow

"About three years ago," says Ed. Neterval in the annual report of the Kenosha, Wisconsin, Cow Testing Association, "I was milking 32 head of dairy cows. As we had an abundance of mixed timothy hay which we raised on the farm, I was feeding this to my herd. I had the opportunity to buy a carload of alfalfa hay that was slightly colored in transportation from the West, so I made this purchase for $180 for the full carload.

"As soon as we began to feed this alfalfa, our cows increased in milk flow very noticeably. We then baled and sold a carload of our timothy hay for $190.

"When our carload of alfalfa was fed up our herd dropped in production to the amount of 3 cans per day or 204 lbs. while we were still milking the same cows as before. We figured out the value of this extra 204 lbs. milk per day for the period of time we were feeding the alfalfa hay and found it paid for itself in extra milk and we had the $190 for the timothy sold besides."

T. B. Cattle Branded in California

Our attention has been called, by Mr. W. B. Stull of California, to the fact that an error appeared in the article by Peter Guyson concerning the branding of tubercular cattle in California.

California enacted a new tubercular law that went into effect in July of this year which provides among other things that all animals reacting to the tuberculin test must be branded with a hot iron with the letter "T" on the left jaw. The brand must be not less than three inches in height and two inches wide, and the branding edge of the "T" shall be not less than one-eighth of an inch in width.

It may be well to add that the article by Mr. Guyson was prepared prior to the enactment of the California law and publication was delayed owing to the pressure on our space for other material. The conflict between the statement as made and the new California law was not noted by the editors prior to the final publication of the article.

Alfalfa Variety Trials

HOARD'S DAIRYMAN:—The most widely grown forage crop in irrigated regions of the Pacific Northwest is alfalfa. At high elevations Grimm alfalfa has been established for some time, and its excellence, under the rigorous conditions obtaining in high mountain valleys, has long since ceased to be questioned. General farm practice has indicated that this advantage was perhaps lost at lower altitudes, and, of course, warmer regions. Research on this point has been carried on by the Washington Experiment Station since 1919, and the results obtained to date indicate that in the Yakima Valley, which is fairly typical of the warmer regions of moderate elevation, northern grown common alfalfas exceed in yield the Grimm variety and others of the variegated strains.

According to the United States Department of Agriculture, there are five alfalfa varieties common to the United States, and the classification in brief is as follows:

"This common group includes the ordinary purple-flowered, smooth alfalfa of which there are numerous regional strains generally grown throughout the western part of the United States.

"The Turkestan group includes alfalfas that have been developed in Turkestan. They differ from the common alfalfas of this country in that they are somewhat shorter and more spreading in habit of growth and are slightly more hairy. No commercial distinction is made between the various strains from Turkestan, all of them being sold under the name 'Turkestan.'

"The variegated group includes the alfalfas that have originated from a cross between common alfalfa (Medicago sativa) and the yellow-flowered species (Medicago falcata). The Grimm, Baltic, Canadian variegated, and sand lucern are best known amples of this group.

"The nonhardy group incl rather distinct varieties that are susceptible to low temperatu They are, in general, very erec habit of growth, recover quickly a cutting, and have a long grov period. The Peruvian and Ara varieties are members of this gr

"The yellow-flowered group cludes the various forms of the low-flowered species. They are e distinguished from members of other group by their yellow flo and crescent or sickle shaped pod

The studies of the Washington periment Station in the Yakima gion, in addition to establishing superiority of the common strains dicate emphatically the inferiorit Turkestan and Peruvian; in fact, ter the severe conditions during winter of 1924—25 the Peruvian fi were depleted to one plant per square feet. One year during the the Peruvian was second highest ducer in the variety study. Per cally Peruvian alfalfas win te rary favor in the Northwest. Sow a result of the solicitations of s seed dealer and with weather co tions mild, a year or two of good sults may be obtained, and when t alfalfas are doing well they prese very pleasing appearance. Such the condition, for example, in I County, Oregon, about 1920. So or later a severe freeze cleans out stand, as occurred in Lake Count 1922.

In the Washington experiment common alfalfas are so similar in duction that they have been grou for further consideration. Over a year period no marked differe were obtained in yields from Dak Kansas, or Montana seed. The su iority of the common varieties the variegated varieties was a ton per acre per year for the six- period. Results obtained in this st in the Yakima Valley are gener applicable, as a rough estimate, half of the alfalfa acreage in Pacific Northwest.

Oregon. F. L. BALLAR

Romance of Dairying

"Much romance," says Sen Copeland of New York, "is attac to the dairy industry, although m of those engaged in it fail to se Actually the dairymen of the cou are doing more for humanity than other group of people, but they, th selves, and most of the public fa appreciate this. When car lines tied up, the ice men on strike, roads are almost impassable, when the general public is on holi the milkman is on his rounds deli ing the life-promoting fluid for little babies who depend upon Therein is the great romance."

Sore throat waits here also

In the **THROAT** *and nose more than* **50 diseases**

have their beginning or development. Some, of mild character, yield to an antiseptic. Others, more serious, do not. At the first sign of an irritated throat, gargle frequently with Listerine, and if no improvement is shown, consult a physician.

watch your throat!

Gargle when you get home

After long exposure to bad weather, after sudden changes of temperature, after mingling with crowds—gargle with Listerine, the safe antiseptic, when you get home.

This pleasant precaution has nipped many a cold and sore throat in the bud, before they became serious.

Listerine, being antiseptic, immediately attacks the countless bacteria that lodge in the mouth and throat where so many colds start.

It is important, however, that you use it early—and frequently.

Most of the fall and winter months are "sore throat months," and for your own protection use Listerine night and morning. It is a good habit to acquire. Lambert Pharmacal Company, St. Louis, Mo., U. S. A.

SOUNDS LOGICAL
The great success of Listerine Tooth Paste has proved that the idea of a scientific dentifrice at 25c (for the large tube) is a popular one.

LISTERINE

INSULATED

Against Ground Chill

Stall floors of Circle A Cork Brick make a layer of insulation between your cows and the cold and dampness of the ground. It protects their udders from chill and prevents congestion and garget.

More than 20,000 breeders and dairymen have already insulated their herds against winter discomfort and disease by flooring their stalls with Circle A Cork Brick. Being 70 per cent cork by volume, Circle A Cork Brick make a warm, dry, nonabsorbent and nonslippery floor that protects the health of cows in all seasons. They are so easy to lay and so reasonable in cost that no dairyman, no matter how small his herd, can afford to be without the protection they give.

A sample brick and the book, "Circle A Cork Brick," will be sent on request. ARMSTRONG CORK & INSULATION COMPANY, 112 Twenty-fourth Street, Pittsburgh, Pa.

Circle A Cork Brick Floors

For Dairy Barns and Hog Houses

OWNER AND TENANT

G. P. WILLIAMS, OHIO

ON the way to his present position as an outstanding Maryland dairy farmer, A. H. Derr of Frederick County worked by the day and by the month. In his young days Mr. Derr cut corn for a dollar a day and was concerned about giving his employer the worth of that dollar! Although Mr. Derr has a working investment much in excess of many farm owners, he chooses to operate a 220-acre farm as a tenant.

The Moran farm running up to the outskirts of Frederick represents an investment that does not permit the owner to stack up his returns and say that it pays in cold cash—but listen! The Moran farm has been formed by the consolidation of two of the historic old farmsteads of this glorious agricultural county, so that the landlord still lives a gratifying retired life in a fine farm residence set back among the trees while Mr. Derr occupies the other homestead with all modern conveniences. This is an ideal form of tenancy.

The Moran farm is not a gentleman's estate but a farm formerly operated by the owner. This owner chooses to live a comfortable life and enjoy seeing his lands in thrifty and competent hands. These same conditions are to be found everywhere—farm owners who stand ready to negotiate part of the farm dividends in personal satisfaction as they look out over the acreage of well tilled land they once labored on and that has a significance that prosperous appearances now enhance. This form of tenancy is rather frequent in Frederick County—the operating tenant being fully equipped with teams, dairies, and implements on the one hand and the landlord maintaining the staunch old houses and barns in the same condition of commanding dignity that has always struck the knowing agricultural eye as a distinctive garden spot of our country.

It was not by direction of anyone that the writer drove to the Moran—Derr farms—it was the four massive teams of Percheron horses working in the hay fields as the casual traveler passed the place. It was the growing corn and the outstretched acreage of June wheat shedding its aroma and the staunch farmsteads that invited a closer acquaintance.

Five hundred dairymen in Frederick County ship milk to Washington; 300 others ship to Baltimore and still another 200 put their product into the Philadelphia daily milk trade. Right now Mr. Derr is loading 600 pounds milk daily—two young Derrs being his right hand men behind the cows at milking time. This cow herd is sort of a double header—half registe Jerseys and half registered Holste During the month of May the D herd stood third in the county testing association. The average for the herd was 4.3; no Jersey av aged less than 5% and the high in the herd scored a fat test of Mr. Derr's two bulls are both p winners in the Maryland fairs circ

Mr. Derr works ten Perche horses, mostly mares, which he been breeding ten years. One of mares has raised five colts on farm, one of which commanded price of $500. The tandem hitch characteristic of the whole Freder — Walkerville — Middletown secti While waiting for the hay to dry the morning of my visit, four D teams of Percherons were cultivat corn. On an adjoining farm two t dem hitches were taking out the l of the barnyard manure.

Mr. Derr himself is the man at hay loader end of the load—twen foot hay wagons being the type m common in the county. One yo Derr was on the mower and anot young Derr was riding the side-de ery rake. There is also a Derr dau ter—possibly it was she, maybe mother, that baked that wonder raisin pie!

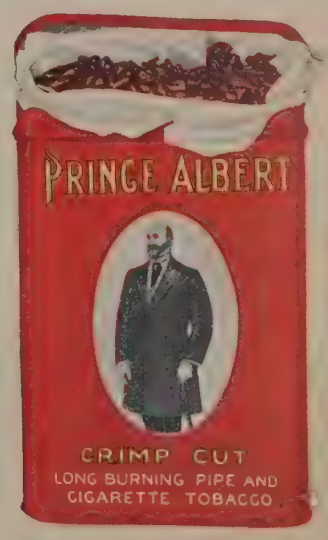
Last year the wheat crop on Moran—Derr farms threshed 3, bushels. Thirty acres of sweet c are being tilled this year at contr price for a local cannery. The av age delivery of ears per acre last y was around three tons, while stalks are cut into the silo once week and stacked up approximat 150 tons of silage as a by-product

There was no manure in the D barnyard the 25th of June. Th weren't two wagon loads of straw sight from that 3,600-bushel crop last year's wheat. There is no sp ing your shoe-shine in Mr. De barnyard at this season of the yea no stepping light or hanging to fence to keep out of soft footing wh moving among the cows after milki

Though hard at work in the l field, both Mr. Derr and his two s were noticeably clean shaven dressed in fresh, clean clothes. man who works hard ought to comfortable—clean, fresh clot contribute to that. I have never s a cleaner dressed and more comfo able looking man working at the "h end" of a hay loader than Mr. De When it comes to turning out a la volume of heavy work and keep ahead of the season with it, perso morale is a large factor—and M Derr's personal tidiness and appar personal bodily comfort seem to radiated all over the farm.

PUTTING UP HAY WITH PERCHERONS ON THE MORAN—DERR FARMS

You can tell 'em for *me*

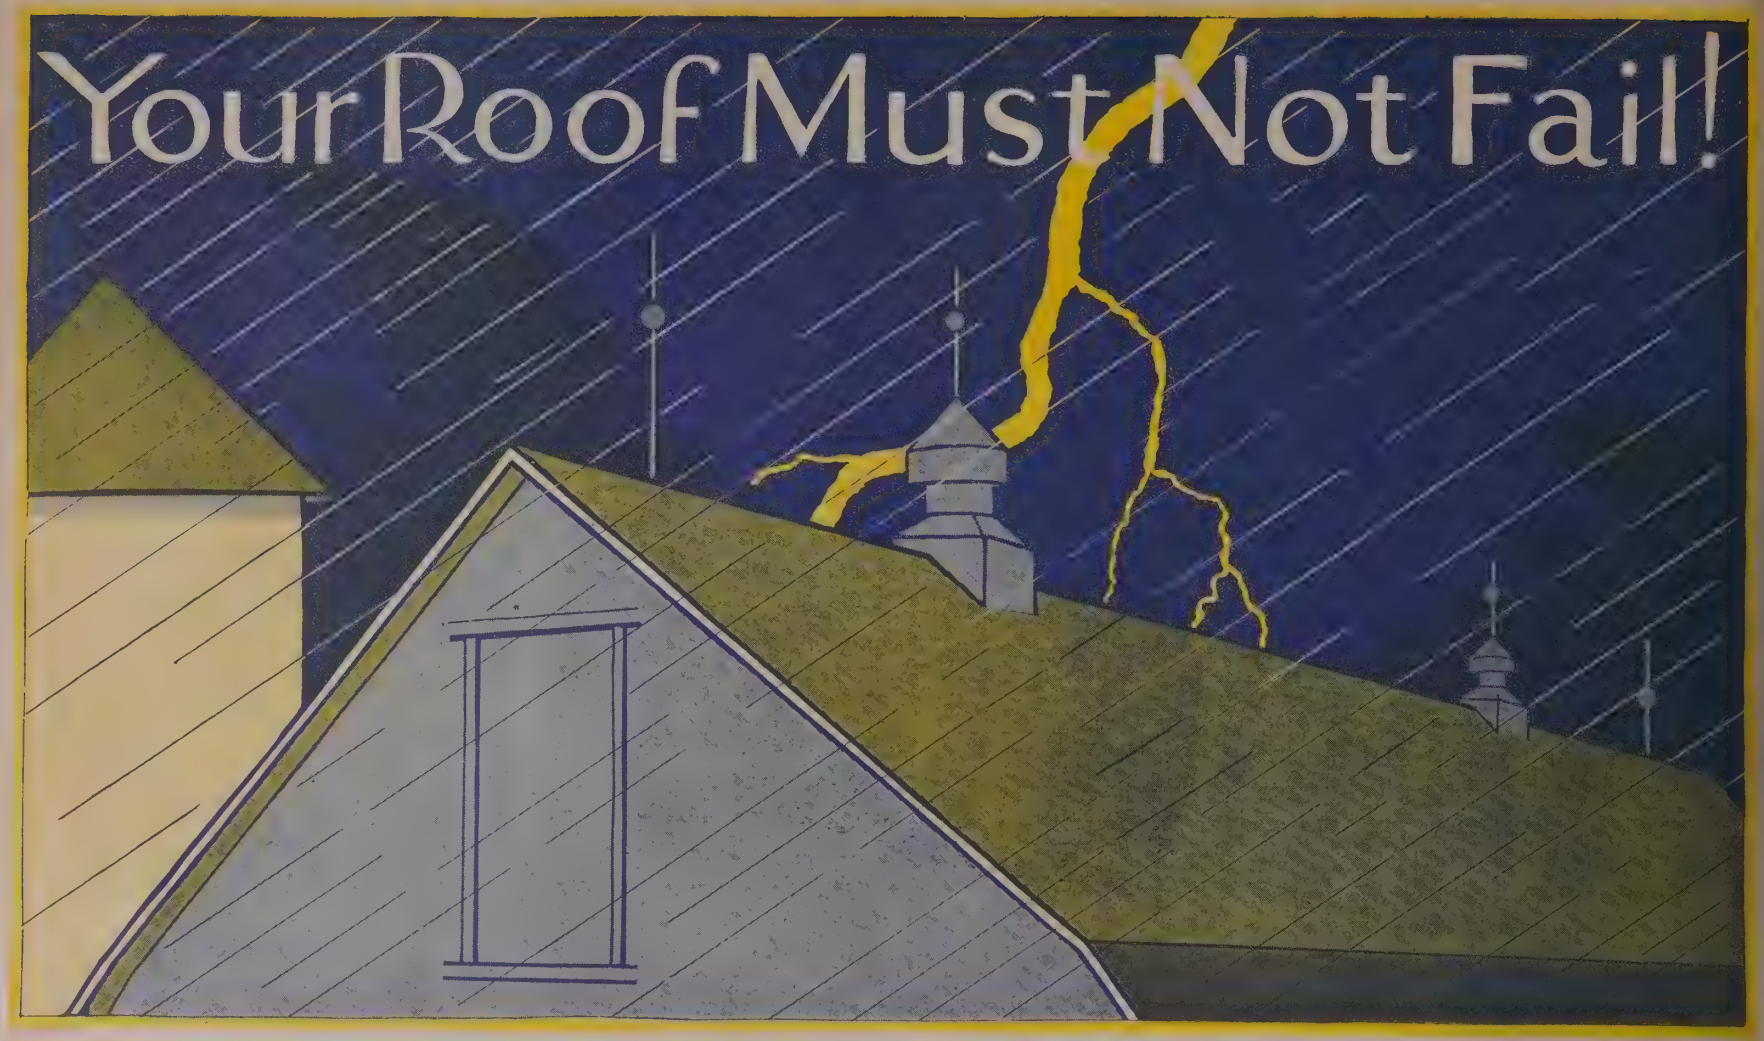


P. A. PUTS into the bowl of a pipe exactly what I expect to take out through the stem—Satisfaction, with what the printers call a cap S. When I first went in for a pipe, I said: "Give me a tobacco that won't bite the tongue or parch the throat—something mild."

The man shoved a bright-red tin across the counter, and said: "Here's Prince Albert." Smart fellow! He knew his stuff. I opened the tin and got a real thrill out of the aroma itself. Some fragrance, Fellows. If the taste was *half* as good, I said, P. A. was *my* brand for life.

Half as good? Huh! It was marvelous! Cool as the boss when you ask for a raise. Sweet as an extra five in next week's envelope. Mild and mellow and long-burning, with that rich, full-flavored tobacco body you want in a smoke. There's nothing like Prince Albert, Boys.

You never get fed-up on P. A., no matter how hard you hit it up. Morning to midnight. Slow or fast. Just fill your pipe and hop *to* it. If you think I'm over-enthusiastic, there's one sure way to tell. Make the personal test!



P. A. is sold everywhere in tidy red tins, pound and half-pound tin humidors, and pound crystal-glass humidors with sponge-moistener top. And always with every bit of bite and parch removed by the Prince Albert process.

PRINCE ALBERT

—no other tobacco is like it!

THE roof over your head stands between your loved ones and the elements. It protects your property, household goods, hay, grain, livestock. It works every hour of the day and night, every day in the year.

Gales of midwinter, laden with sleet, hurl their burly strength against your roof when the thermometer is below zero, grasping at it with icy fingers. Midsummer heat beats down upon it when men and animals seek the relief of shade. Rains pour down in floods, and always, the roof must stand the stress. You depend on it. *It must not fail.*

How much thought do you give to selecting the material that must meet this warfare with the elements? What assurance that when the job is finished, it will remain steadfast against water and wind, heat and cold, hailstorm and gale?

You can tell something about roofing by looking at it, handling it, but to a large extent you must buy it on faith. You must take the manufacturer's word. And fortunately there are manufacturers who know the farm problem. They have studied roofs under all sorts of conditions for many years. They have experimented with every kind of material. Modern machinery and efficient methods keep costs down and make prices reasonable.

That's the kind of roofing made by manufacturers who advertise in this paper. By years of square dealing they have built up the reputations men are proud of. Their laboratories jealously protect that reputation, and their inspectors see that no inferior material goes into the product.

The finished product is honestly made to give service, and on goes the Trade Mark, the personal signature of the manufacturer. It's a product he's proud of. When he drives by your place he will point to it after years of use and say, "That's one of my roofs."

And when you see that manufacturer's advertising in this paper, you know the maker backs it with his reputation. On top of that this publication adds its endorsement, saying, "This is a good and worthy product. You can buy it and be well satisfied."

These wonderful Radiolas faithfully reproduce the fine programs from the great broadcasting stations

FOR perfect reception of broadcasting programs in the country, away from congested city areas, two models of the RADIOLA are ideally adapted.

Everyone knows the famous RADIOLA 20, which established itself as "the greatest value in radio." Many thousands of these receivers are now in use throughout the country. Their amazing sensitivity and selectivity have given them a deservedly high reputation, and particularly in farm homes.

And now RCA, in cooperation with the Westinghouse and General Electric laboratories, offers another remarkable value in a highly efficient receiver—the new storage battery set, RADIOLA 16.

RADIOLA 16—Storage battery receiver of great compactness. For selectivity, sensitivity and tone quality, it sets a new standard for receivers in its price class. The cabinet is finished in mahogany.

Less accessories $69.50
With Radiotrons $82.75

RADIOLA 20—Dry-battery-operated receiver, with amazing sensitivity and many times as selective as the average antenna set. Ideal for distant reception. Can readily be adapted to socket operation. Ideal to use with the new RCA Loudspeaker 100-A.

Less accessories $78.00
With Radiotrons $89.50

It has the widest musical range ever achieved with one-dial control.

When used with the new RCA Loudspeaker 100-A, either of these genuine RADIOLAS will bring into your home the fine programs from the great broadcasting stations. And if you have electric power service, either of these sets can be adapted for alternating current operation by the addition of socket power devices.

The new complete line of RADIOLAS includes sets ranging in price from $69.50 to $895. Any RCA Authorized Dealer will gladly demonstrate these wonderful instruments for you. A RADIOLA installed in your home today will pay for itself many times over.

Seasonable Live Stock Notes

[ERE we are again back in sight of home barns and familiar surroundings. It has been a grind for show animals that ted early and hung on proving r worthiness to contest for champ- nships in the arenas of the last big ws.

erdsmen who have gone the full e welcome regular meals and ething to sleep on besides baled w. These artists of show ring ests who polish horns, who pa- tly teach animals to behave while ding at pleasing postures, who e animals up or down the line at a from the judge—these men con- ute much to the breeding of erior animals as also to the enter- ment and education of thousands eople who sit at the ringside. Let fully acclaim their services.

et us look to the future to the do- of things tomorrow and next k that may influence the returns n our flocks and herds during the oming new year.

Let's Be Fair With Our Cows

ome dairy cows will show a loss ome herds and a profit in others, of which implies a difference in managers. Usually in such cases reason may be ascribed mainly to er feeding both before and after ring.

Dairy cows are a little like popular letes; it is difficult to make them duce in maximum form every year. y go down some years frequently no apparent reason.

One should not be in too great te to turn a cow out of his herd apparent failure to produce satis- orily. We know a very successful yman in Michigan who gives each ng cow two years (lactations), to ve her right to remain in the herd. minimum standard is fairly high. gives each cow the benefit of the bt and he also gives cows good ra- s. He aims to be fair with his cows. t this time of year what better g can one do for one's self than be fair with one's cows.

Improve Unpalatable Roughage

When seasonal weather conditions such as to reduce the quality of ghages to the extent that cows refuse to eat normal amounts, the of milk production increases un- something is done to improve the atability of such roughage. This r, for example, quite a lot of Wis- sin's fodder corn was caught in e or less rain every day for two ks after it had been put in shocks. vs will certainly cut down on the y consumption of roughage if of- d such fodder. Hay is sometimes coarse or has lost too many leaves e relished by cows. Such rough- may be made more palatable by ting it through a feed cutter or der after which it is moistened h thinned feeding molasses. The lasses, aside from its feeding value ch is nearly equal to ground corn, es a flavor relished by cows after y have become accustomed to it.

Building Up an Abused Cow

few days ago we received an in- ry from a subscriber who had ked a high producing cow right up calving time. He wanted to know y to proceed through the succeed- lactation period. Presumably the uirer wanted his cow to continue give plenty of milk after calving at the same time regain the de- tions resulting from past abuses. s a timely topic about cows in like umstance of which there are a siderable number. The first thing cow will do that will likely sur- e her owner is to bear a healthy, normal-sized calf. That is, she will do this if her pregnant feeding period was reasonably good. The second thing that will surprise the owner of this cow is that she will likely drop considerable in production from her normal level in spite of how well she is fed. We assume here, of course, that the cow was pretty well worked down when she calved. Liberal feeding is all that can be done for this cow until she approaches the close of her lactation at which time she should be dried off 8 weeks before calving. During this 8 weeks she must be fed enough of the right feeds to enable her to rebuild her body.

Swine Breeding Season is Here

Sows bred on November 7, three days ago, will farrow on or about February 27 but that is too early for pigs on most dairy farms. Some farmers with good equipment and enough gumption to stay up late nights in the hog house will venture the risk.

One of the most important immediate factors that may have considerable to do with the number of pigs farrowed next spring is that of condition of sows at breeding time.

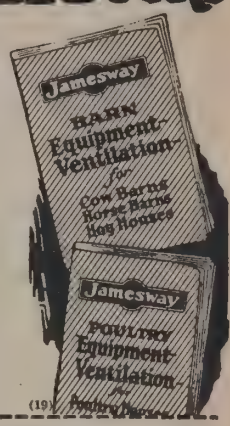
Progressive swine producers have learned to imitate a practice known among sheep producers as "flushing." Beneficial results of the practice are based on the theory that sows that are made to gain rapidly for a week or two before being bred will release a larger number of female egg cells, ova, at a given heat period than they will under any other condition. Inasmuch as the number of pigs in a litter is limited to not more than the number of ova released at the time of conception, the practice is based on fairly firm calculation. The success of the practice requires also that boars in good breeding condition be used.

Fitting the Boar for Service

A well known authority on swine production makes the statement that nine out of every ten mistakes made in feeding the mature boar are the result of supplying him too liberally with feed and too little with exercise as a consequence of which he becomes too fat.

A large number of boars will not be put in service for several weeks. Is your boar overweight? Does he have opportunity for a reasonable amount of exercise? Now is the time to consider whether some changes ought to be made in his management.

Record Date of Service



Many a litter of pigs has been lost because the owner failed to record the date of service of the sow in consequence of which he neglects to take proper preliminary precaution at farrowing time or sometimes takes no precaution at all. The sow does the best she can which is surprisingly well if the weather is dry and warm but frequently she gets caught on the rainy side of an old straw pile or out in the woods. Her pigs perish and her owner takes up the slack in his purse strings. Occasionally one records the date of service and promptly forgets where he put the record. Frequently service records are marked down on whatever happens to be handy when one thinks about marking them down. We have seen such records on hog house doors, on the wall of the hog house, on a shingle stuck overhead in the hog house, or on bits of paper that happened to be tacked up in the hog house. For the sake of sows and their prospective litters it is important to record dates of service and to be able to find the information when it is needed.

Send for these Two FREE Books

If you will fill out coupon below telling us what kind of a building you are planning to build, remodel, ventilate or equip we will send you literature and information that will save you a lot of money.

These two books tell you how to save money on material and construction costs—How to plan and arrange your buildings to make them convenient and practical—what is the best wall construction—what is best floor material, etc. These and many other vital questions are answered in these two books. These books also tell you about labor-saving Jamesway equipment—Stalls, Stanchions, Drinking Cups, Litter Carriers, etc. for the cow barn; Troughs, Waterers, etc. for hog houses; Feeders, Nests, Waterers, Incubators, Brooders, Heaters, for the poultry house—a complete line of every kind of labor saving, money making equipment for any farm building.

Fully 50,000 farm owners have positively proved that you can lower the cost of producing milk, beef, pork or mutton with the Letz System of Home Crop Feeding. They have actually proved that Letz Mixed Feed Makers will:

1. Save 25% to 50% of present feed crops by utilizing waste.
2. Release up to 30% of your present feed crop acreage for cash crops.
3. Increase milk and meat production up to 30% through better feed preparation.
4. Save up to 25% of labor in handling feed crops.
5. Improve health and condition of all farm animals.

Write today for your free copy of "The Letz System of Home Crop Feeding." It's full of valuable information and ideas that every stock feeder should have; information taken from the experiences of stock feeders in every state in the Union.

News From Washington, D. C.

[Special to Hoard's Dairyman.]

Washington, D. C., October 20—Announcement is made this week at the Washington office of the American Dairy Federation that it is now believed to be well assured that the request of the industry expressed through the Federation for considerable new research work in the Bureau of Dairy Industry will be approved by the Bureau of the Budget. This is the same program as presented last year, and the fact that in spite of disappointments last year the representatives of the industry came back this year with the same program seems to have emphasized the importance of the program. Dr. C. W. Larson, chief of the Bureau, made detailed explanations of the program before the advisory committee of the Budget bureau last week, and has had the full support and approval of both Dr. A. F. Woods, director of Scientific Research, and Secretary of Agriculture Jardine.

The program asked for has been outlined in this correspondence before. It includes approximately $20,000 for intensive new work in nutrition of dairy cows, about the same amount for further work in studying the problems of breeding to fix high production characteristics. More animals for experimental work in both the inbreeding and the cross-breeding experiments are badly needed and also funds to carry on a lot more co-operative work where the only expense is for supervision. About as much more appropriation is asked for to go ahead with work of fundamental character in the various manufacturing problems in the industry, in chemistry and in bacteriology dealing with the problems of handling milk and manufacturing milk products. The remainder making up approximately $100,000 is for the care and feeding of the larger herd of cattle needed and two small new buildings on the Beltsville experimental plant.

The statement is made on behalf of President Bailey and the officers of this organization that they believe every project set down is of such grave importance to the industry and the public, in helping this greatest of all agricultural food producing industry, that they are prepared to take the whole matter directly to Congress to get its approval on the whole program.

Poultry production has stepped up to the third largest branch of animal industry, according to a Department report just issued. Poultry products now account for 16 per cent of the total of all animal products in domestic commerce, it is stated, with hog products accounting for 22 per cent and dairy products 40 per cent. These figures are in sharp contrast with the volume of government money spent through the department and of taxpayers' money spent in the several states on projects designed to aid and assist the development of these industries. In the U. S. Department of Agriculture, for example, although there is a bureau devoted to dairying, it has the least money of any bureau in the department except one, while as to the poultry industry it is a minor part of another bureau, and while some unusually effective work has been done both in the production and the marketing field, it ranks way down below the average of a large number of other kinds of work far less important in dollars and cents.

One reason for all of this is that the Department of Agriculture is not organized along lines of commodities or industry divisions. It is organized chiefly on the basis of a bureau to each science involved, one on plants, one on animals, one on forestry, one on meteorology, one on insects, one on chemistry, one on economics, etc. This scatters the poultry work in at least three bureaus, animal industry, economics, and entomology, just as it does the work for a dozen other great agricultural industries, and it handicaps and discourages those in the industries who come to Washington for real help. The Dairy Bureau was a step away from this situation.

Progress in Spite of Adversity

HOARD'S DAIRYMAN:—Leland Bandelow had always been a strong, healthy farm boy until a strange lingering sickness, lasting for two years, left him crippled and almost helpless. This misfortune, together with the death of his mother, left him utterly discouraged.

However, with a faint ray of hope he again entered school to complete his high school education. He was especially interested in agriculture to which he applied himself diligently and live stock was his favorite branch. He never missed a judging contest though he often hobbled along on his crutches a few minutes late.

"I am going to make the stock judging team," he told his teacher.

The first six weeks of agriculture last fall were devoted entirely to stock judging. Every day the instructor kept a careful report of the boy's scores. The day the winners were announced was exciting for Leland for his name was among the first three.

The ride to Madison to the State Live Stock Judging Contest was anything but comfortable with his stiff leg jostled in a crowded car. Nor were his travels about Madison convenient for he had to depend on his colleagues for help in getting about

LELAND BANDELOW AND HIS CHICKENS

the city and to and from the jud arena. However, his efforts were rewarded for he helped his teamn win ninth place in judging all cl of live stock among 72 conte teams and second place in the jud of beef cattle.

Supplementary to the class the boys taking agriculture ha have supervised and directed projects. They could choose a c calf, a sow and litter, a flock of or capons, ducks, geese, or turk They could plant pedigreed gr test herds of cows for butterfat prune, spray, and care for orch or have any other kind of a prac home project. Leland decided to for his project a dairy calf ar flock of chickens.

One of the best Holstein h calves in the barn was selected started on the road to the show but more effort was required to the chicken project. There was a adequate hen house or brooder h on the farm, so upon the advice o agricultural teacher he bought material for the hen house and dered it hauled to the farm sho the high school. In a short time boys taking the farm shop co constructed on skids a fine Wisco brooder house. About April 15 it hauled to the farm a distance of t miles. In a short time 400 chicks cozily domiciled in the new hom

Here was when Leland's real cation in poultry husbandry bea He soon learned that the road to p try success was not an easy one that one who thinks there is litt know about the raising of chick greatly mistaken. He lost n chicks and to cap the climax brooder stove went out one cold n which meant the loss of—I won't t how many.

To make a long story short, losses were replaced and the les learned proved of value in the u ceeding days. He now has 360 i chickens which, barring any g calamity, will sell for enough to r all losses and expenses and still l a fair profit.

Wisconsin. MANLY SHAF

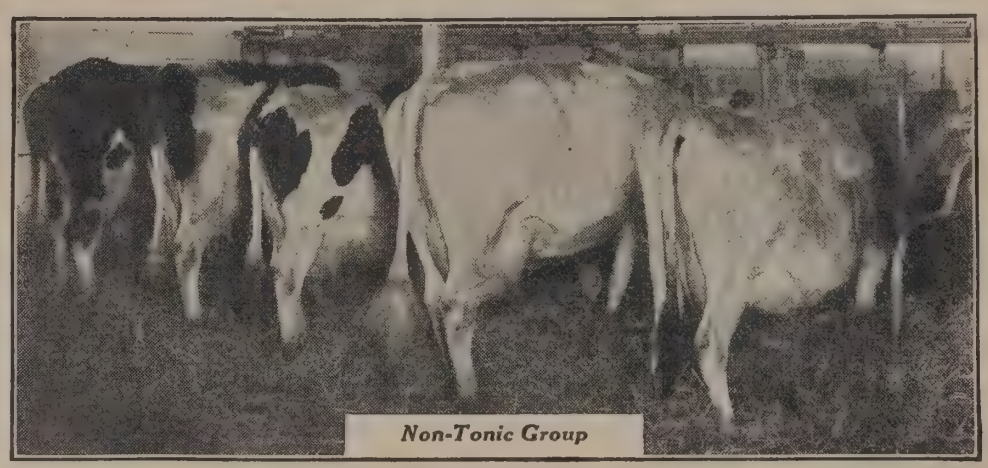
BULLETIN

Profit Records on 10 Cows for 10 months



Research Farm—Dr. Hess & Clark, Inc., Ashland, Ohio

Tonic Group

These five ordinary-grade cows were on pasture in August when they freshened. In September they received a common dairy ration of ground oats and corn, bran with oil meal added. That month, the first month after freshening, they made an average profit of $9.94 per cow. They did not receive any Tonic—only the ordinary dairy feed above and ordinary care. But beginning with October they had Dr. Hess Improved Stock Tonic added to their feed and were placed in competitive test with the five other cows shown below. Read their profit record month by month for 9 months while receiving Dr. Hess Improved Stock Tonic.

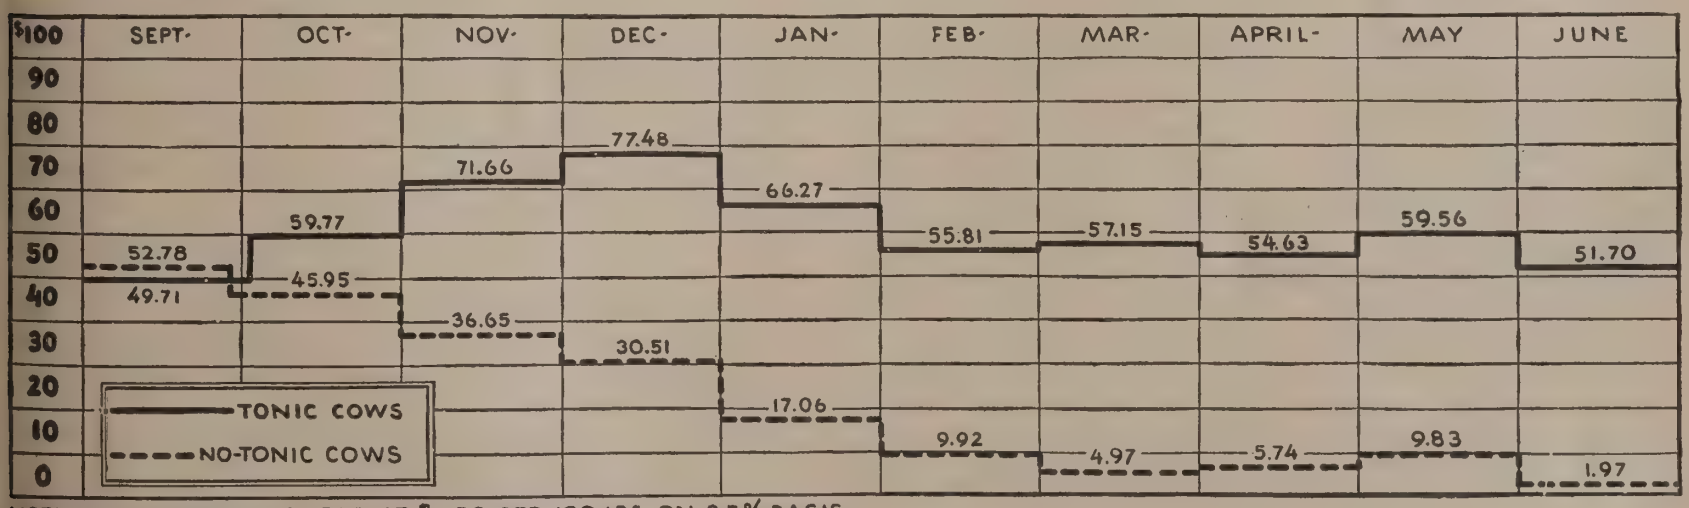
These five cows are as nearly like the cows above in grade and condition as possible. They also freshened in August while on pasture. During September, their first month after freshening, they made a profit of $10.55 per cow. Note that they were a little better milkers, to begin with, than the cows above. Beginning with October they were fed alongside of, and had the same feed and care as, the cows above, but these cows opposite did not receive Dr. Hess Improved Stock Tonic at any time.

Non-Tonic Group

Beginning October 1st these two groups of cows were placed in competitive test. They received the same ordinary feed and care, and there was no effort made for high production. The results demonstrate the effect of Dr. Hess Improved Stock Tonic.

MILK—The milk production record showed that while the production of the Non-Tonic group decreased at the rate of approximately 9% the Tonic cows lost only 3% per month.

The Tonic cows maintained an average weekly production of 1049 lbs., while the Non-Tonic cows averaged 646 lbs. weekly.



By sustaining their production, the Tonic cows gave 16,900 lbs. more milk during the 10 months' period.

BUTTER FAT—During September, the butter fat production of the two groups was practically even, the Non-Tonic group being 3.2% and the Tonic group 3.15%. It then increased, with both groups reaching their highest points in January.

The average butter fat for the whole period for the Tonic cows was 3.64%.

The average butter fat for the whole period for the Non-Tonic cows was 3.41%.

PROFITS—A record of profits combines the milk production, butter fat, and feed consumption into one very interesting picture. Below we give a graph which traces the profits month by month.

NOTE:- MILK VALUE FIGURES AT $2.50 PER 100 LBS. ON 3.5% BASIS

OBSERVATIONS—You will note the Tonic cows did not reach their peak profits until the third month on Tonic, while the first month was the peak for the Non-Tonic cows.

The Tonic cows never dropped as low as the month before receiving Tonic. The sustained milk production at a higher butter fat average made this possible.

The extra profits earned by the Tonic cows during these 9 months amounted to $391. The total cost of Tonic used was $22.50.

Dr. Hess Improved Stock Tonic

APPETIZER—REGULATOR—MINERAL BALANCE—*all combined in one product*

PRICES: 100-lb. drum, 10c per lb.; 500 lbs. 9½c per lb.; 1000 lbs. 9c per lb.
Ton lots 8½c per lb. *(Except in extreme West and Canada).*

Why Not Have a Debate?

The old time things are coming more and more into modern use and even the spelling bee is now the fashion in many places. The book markets are flooded with "quiz books" containing sets of questions on both general and special subjects and it is not only fun to test yourselves on these but a great deal of information is picked up besides.

The same thing is true of having a debate. Of course there will always be people in a community to say that a debate is a stupid, old fashioned thing. Don't mind them; the world progresses in spite of the folks who keep saying "it can't be done" and "what's the use" and "that's no fun." There are many communities that have a fine set of up-and-coming young people who would really enjoy doing some think serious along with having their fun but they need someone to start them. Often a debate proves just the thing to interest them in things that are wholesome and educational.

Subjects for debate, especially when you are just beginning to interest people in them, should be chosen with the greatest care. They should be of timely interest and never along religious lines or on other subjects that might arouse antagonisms. As I remember the debates of my childhood, they were on very silly questions such as, Resolved, That it is better to be ready and not go, than to go and not be ready; or, Resolved, That fire does more damage than water. Such questions are only a waste of time for they are not instructive and they are not interesting.

The extension division of the University of Wisconsin makes the following suggestions as to questions that are both interesting and instructive.

Resolved, That the basis of taxation for state revenue should be income rather than property. (This is the question being debated in Iowa this year by farmers under the direction of the Iowa Farmers' Debate Council.)

Resolved, That more efficient productive methods should not be developed without first developing better marketing facilities.

Resolved, That this community set aside every Saturday afternoon for the purpose of community recreation.

Resolved, That modern conveniences should be secured for the farm house before they are installed on the farm.

It is usual to have a debate judged by three persons acceptable to both sides. One person, however, may act as judge and present his decision orally, with reasons for it, at the end of the debate, or the audience may ballot for the decision.

Plays, too, are valuable for providing interesting community evenings. Everyone will say at once that he cannot be in a play because he does not know how to act but it is surprising how much real talent an amateur production will often uncover in a community.

Information as to getting up plays and debates can be had in most states by writing into the extension division of your state university or agricultural college. If they do not have the material they can tell you where to write to get it.—LUCY THOMPSON.

Neighborly Notes

Last year our community spent Thanksgiving in quite the nicest way in which I ever celebrated the day. Thanksgiving has changed step by step just as the trend of our progress has altered, and instead of being (as it was in days gone by) a day for meditation and a day spent in giving thanks to the Giver of all good things, with feasting thrown in as a necessary evil, it is now observed as a day of feasting with a scant amount of thanks thrown in for the sake of easing our conscience. As a result it has become rather a hit-or-miss day, for there are not even the large family gatherings of yesteryear. Taking all of these items into consideration the people of our community decided last year to hold a community gathering and dinner on Thanksgiving Day at the church. Perhaps the idea reverted back to the Pilgrims gathering in the church for this day of thanks, but certainly it was not celebrated in any stiff, cold manner, but in a way that left a glow in every heart because of its simplicity.

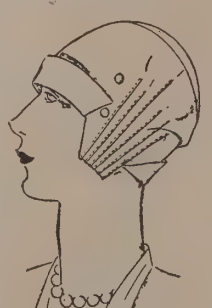
It was planned to have a community dinner at which everyone in the surrounding district was welcome regardless of creed, belief, or church. And everyone came, many even bringing guests with them who had come from a distance to spend the holidays with them. This gathering supplied a place for everyone to come to and no one was left out to spend Thanksgiving Day alone at home because the children just couldn't get home for the day.

The housewives in the community had been busy for days baking, cooking, and roasting, and then that memorable Thursday each packed her baskets full of goodies and set forth for the church which lay in the center of the community. Here in the church parlors long tables had been spread. And as we took our places the minister of the little brick church asked grace, and gave thanks for the blessings that had been bestowed upon the community through the past year. The minds and hearts of all his listeners followed with him through the progress of the year which had just elapsed and echoed his prayer of thanksgiving. Then everyone fell to with a hearty appetite and did justice to the board which was literally groaning before them. Such a dinner,—roast goose, duck, and chicken, mashed potatoes, dressing, gravy, rolls still hot from their recent contact with the oven, creamed carrots, squash, cabbage salad, celery, beet and cucumber pickles, fruit jello, devil's food and angel food cake, not to mention hickory nut cake, pies of apple and pumpkin, with cheese and coffee and tea, of course. Even now I know I have forgotten part of the menu; it was a meal no pen could paint a picture of and when we had finished it was the guests and not the board that groaned.

After everyone had eaten until he could eat no more, the women all worked together, sided the tables, washed the dishes, and straightened the parlors. The young people meanwhile had wandered off in search of excitement in the form of a neighboring football game, but the older folk were quite content to sit about in the pleasant rooms and spend the afternoon in visiting with old friends; many a friendship was renewed which had of necessity been let to lapse a bit through the busy summer and autumn months.

With a little forethought a very interesting time might be provided if desired. Sports might be provided for the young folk on the church lawn, games for the children, and a program of music for the older folk. Or it might be an evening affair with dinner at six or seven o'clock, followed by an evening's program consisting of music, readings, a playlet, or a lecture, or even moving picture slides of an educational aspect.

But just to spend the day as we did is indeed worth while, for the feeling that accompanied us home late that afternoon after a day of feasting and visiting under pleasant and agreeable circumstances was one of comfort, well-being, restfulness, and thankfulness.—ETHEL MORRISON MARSDEN.



The Family Pocketbook

"Father, can you spare me five dollars this morning, Ellen's shoes are just entirely gone?" Ma Brown asked timidly as father shoved back his breakfast plate. "Yes, that's just the way it goes; money, money all the time, that's all you ever think about. What did you do with that money I gave you just the other day? You get all the egg and chicken money, but that is not enough. How am I ever going to pay the taxes and interest I'd like to know? Well, there take it."

Oh, how ma hated to ask father for money. It had been three months since he had given her the money he had spoken about, but if she had told him it would only have made him worse. She would never ask him for money for herself, but for the children; well, she just had to that was all. How she resented his attitude. She worked just as hard or harder than her husband, bought most of the groceries and most of the family clothes with her egg money, yet whenever she asked for a cent father acted just like he was being held up. So ma goes silently on with bitterness in her heart and does the best she can, contriving to ask for as little as possible and father goes on selfishly

Buy a Vest Pocket Herd Book

drawing the strings of the pocketbook ma helps to fill tighter and tighter.

Ma Brown would be quite indignant if I should tell her that she is greatly to blame for father's stinginess, but she is nevertheless.

When she was first married she had plenty of clothes to last for three or four years, she was so good at making over things. She had the egg money, yes, and the butter money, too, then for father wasn't keeping but two cows and didn't sell to the creamery and pocket the check as he does now. Ma had all the money she needed for the house and never needed to ask for any of the farm money; she never even thought of wanting any of it. She was so glad they were buying the farm and getting the machinery father needed. Even when the children were little she had plenty, for it only took such a little to buy the material from which to make the little dresses and suits, and so the years slipped by.

Father never thought of ma as a partner with whom to share their joint earnings. Why, wasn't she his wife, and didn't he provide her a good home and plenty to eat? It was a wife's duty to help her husband to get ahead. Now that the children have grown too large to be dressed with her egg money, father has grown so selfish that ma is afraid to ask for anything. If she had the gumption to "fight it out" she could perhaps make father see the light. He isn't really a bad sort and does not realize how ma and the children feel. He is doing just as his father did and as ma let him do in their early years. If once he realized just how degraded it makes ma feel, how like an unpaid servant or slave, he would be horrified and only too glad to make amends. I doubt if she ever will, she thinks he ought to realize it all without her telling him. I do hope though that she will teach her boys and girls to look at marriage when they approach it as a true partnership and insist that they start right and not make the mistakes she made.—GRACE GORDON.

Making Footsteps

It was a cold, wintry day when little Bobby and his father started across a snowy field on their way home from town. Father walked ahead saying, "You follow me, Bobby, and step in my tracks." At first easy progress was made as father took short steps and kept his path straight but gradually his steps grew longer and uneven. Soon a little voice behind him spoke up, "Be careful of your steps, daddy. Remember I'm following."

As I read the above story, its big thought sank deep within my heart and spread into many channels. I thought how true is that old saying, "You teach much by what you say, more by what you do, and most by what you are, for an ounce of example is worth a ton of teaching." If we could mentally see ourselves as the noble ideals which the little folks often picture us in their minds, would not it help us to make our tracks just the best we could for those little feet to follow.—LULA A. CAMP.

Grape Nut Bread

I thought I had made, or at least heard of, about all the kinds of bread there are, but the other day my husband came home with a recipe for grape nut bread as it is made by Mrs. J. B. Parker of Indianapolis. I knew I could depend on anything recommended by so fine a cook so I tried it and the results were all that I expected. Here is the recipe in case you long for something different in the way of bread:

2 cups white flour
⅔ cup sugar
1 egg
1 cup sour milk
2 teaspoons baking powder
½ teaspoon soda

Beat all together and then add ¾ cup grape nuts. Let stand 20 minutes. Bake slowly about 45 minutes.

I've lately seen grape nuts used in two other ways that I liked. At a party not long ago someone remarked to the hostess, "Who but you, Kate, would have thought of grinding up almonds to put in this whipped cream." Kate said nothing then but she told me later that the thing that tasted like expensive salted almonds was nothing but grape nuts. She had mixed them with whipped cream and put it on sponge cake.

Grape nut ice cream is delicious, too, either with the grape nuts put over each individual serving or else put into the freezer when the cream is about half frozen.—LUCY THOMPSON.

Wonderful Combination on White Indian Head—No. 3013—This lovely hemstitched set on best Indian head is sure to please. The many pieces include: Scarf, 18x45 inches, 65c; centerpiece, 18 inches, 28c; centerpiece, 36 inches, 88c; centerpieces, 44 inches, $1.25; centerpieces, 54 inches, $1.75. Luncheon set, consisting of one 36x36 inch lunch cloth and four 14-inch square napkins, $1.60; napkins, 14 inches square, per dozen, $2.20; buffet set, three pieces, 65c; vanity set, three pieces, 50c; pillow cases per pair, 42 inches long, $1.40; pillow cases, 45 inches long, per pair $1.50.

The design, worked in orange and yellow, with shaded lavender centers in the larger flowers and two shades of pink combined with blue for-get-me-nots, green stems and leaves in the smaller flowers, is very artistic. A detailed working chart showing where each color is to be used is furnished with each piece of material. Be sure to specify number and size of material desired when ordering. Send to Embroidery Department, Hoard's Dairyman, Fort Atkinson, Wisconsin.

DEMAND BAYER

ASPIRIN

The whole world knows Aspirin as an effective antidote for pain. *But it's just as important to know that there is only one genuine Bayer Aspirin.* The name Bayer is on every tablet, and on the box. If it says Bayer, it's genuine; and if it doesn't it is not! Headaches are dispelled by Bayer Aspirin. So are colds, and the pain that goes with them; even neuralgia, neuritis, and rheumatism promptly relieved. Get Bayer—at any drugstore—with proven directions.

Physicians prescribe Bayer Aspirin; it does NOT affect the heart

National Dairy Show Down in Dixie

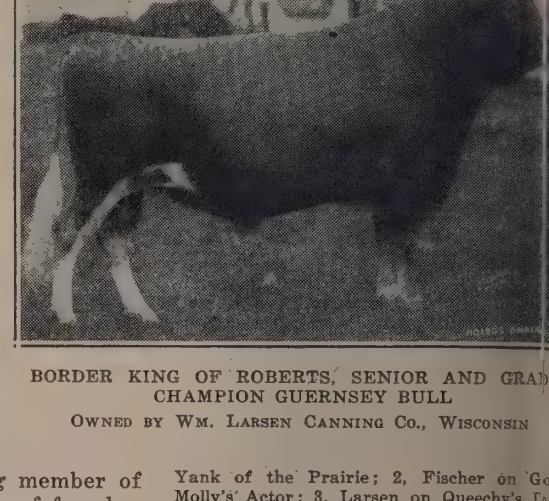
(Continued from page 1054)

one there. Imp. County Flower of Langwater, good enough to head most Guernsey cow rings, was second, and Admiration of the Prairie, a former National grand champion and a very good cow indeed, was third. In fact some of the cows that didn't win any bright colored ribbons would look well in most herds. It was by quite a margin the best cow class of the show.

It would be unjust to pass by Shuttlewick Levity with just the customary mention. Not only was she the outstanding cow, winning senior and grand championship honors, but her senior yearling daughter was first in class, another daughter was seventh among the aged cows, and a maternal sister was second prize 4-year-old. More than that she and her sister headed the produce of dam class and two of her daughters were second. Add to that the fact that she is a proven producer, her Class G record of 804 lbs. fat is still second for the breed, and you must mark her down as the outstanding member of an unusually good family of females.

The 3-year-olds were the other outstanding class just as they were at Waterloo. Mrs. McCormick's Florence of Waldwic finished first again as she has all season and right behind her was Raider's Golden Lily of Roberts owned by Chas. Hovey of Iowa. The latter showing dry was the best bodied one in the class. Had she been in milk carrying the right kind of an udder she would doubtless have been number one.

Cherub's Queen of the Prairie, last year's junior champion, was first prize two-year-old.



Junior championship was won by Imp. Aiyukpa Comique, a junior yearling owned by Mr. Williams.

J. C. Penny's get of Langwater Foremost, undefeated on the eastern circuit, won another blue at Memphis and four by Langwater Eastern King were second. A group by Ladysmith's Cherub from Shorewood Farm were away down in eleventh place below at least three they had beaten two weeks earlier at Waterloo. This was one of the few nearly mature gets shown, and while the individual members may not have won the ribbons in the open classes to entitle them to place at the top, it did look as though they belonged materially higher number eleven.

Only one state herd, that from sissippi, was shown.

The awards follow:

Bull 4 years or over—1, Larsen Canning on Border King of Roberts; 2, Emmadi Shorewood Resolute; 3, McCormick on Rose Cherub; 4, Firestone on Sergeant's ernor of Mountrose; 5, Ransom on May of Ransom Farm. Bull 3 years, under Tenney on Cherub's Golden Secret of S wood; 2, Firestone on Sergeant's Senat Mountrose; 3, McCormick on Cantigny's lier; 4, Gayoso on Gayoso Roberta's Bull 2 years, under 3—1, Marsh on Ch

Eight an entered by State Breeders' Associatio Mississippi.

Senior and grand champion bull—B King of Roberts. Junior champion bull—e olute's Eminent.

Senior and grand champion cow—Sh wick Levity. Junior champion cow—A Aiyukpa Comique.

The Ayrshires

Judge: John Cochrane, New Jer

The Ayrshire show this year wa nearly so large as it was in 1926 o did the quality of the show as a wh seem to us quite so good, altho the tops in practically every c were good ones. There were 125 h from 10 herds shown, a little m than half as many as a year a This, however, was to be expected

ephis is in a section where not ev- y farmer knows what an Ayrshire looks like, and it was hardly pos- that all of the good herds that out at the earlier shows would the long ship south.

e aged bull class with but five tes was one of the most interest- of the show because every entry a good one and all but the top been winners at large shows ng the past two seasons. Cava- Ping Pong owned by Seitz was probably the first time he ever d there at a big show. Cavalier's y Vernon, first prize aged bull at erloo this year, was just above and ahead of him was Imp. land Lucky Star from Strath- Farms, first prize aged bull at 1926 National and in many re- s the best dairy bull of the five. did not, however, have enough g of rib to please the judge. Al- rest Ringleader, grand champion astern States this fall and a con- nt winner for the last two sea- had to take second place to a omer, Imp. Hobsland White , a paternal brother to "Lucky " recently imported by Strath- Farm. Hobsland White King is g, stretchy, breedy looking bull should prove a good one, but he 't at his best on show day, per- , because he hasn't been long out uarantine.

valier's Bondsman, a 2-year-old m by Adam Seitz and Sons, was surprise of the bull show. Three s ago at the Dairy Cattle Con- s he was beaten by a Fairfield n entry. At Memphis, Bondsman with the Kansas bull fifth and e was that much difference in the at the two shows. Three weeks er he was just a fairly good bull. he National he was a mighty well n winner that deserved his place. e aged bull was senior and grand pion and Strathglass Kirbo, also ed by Strathglass Farm, was or champion.

e aged cow class with thirteen ies didn't have as many real good as we like to see in an Ayrshire class although we believe the er would compare quite favor- with the one that won a year When they were finally in line . Great Cross Snowflake, a Strath- s entry that we haven't seen out re, was first; White Dorothy the same herd was second; and pon Lass from Fairfield Farm, ing aged cow at Waterloo, third. he first cow apparently hasn't fresh for long and looked like a class dairy cow. She has enough e, breed, character, and good lines, needs only a little better udder to a strong contender in any com- . White Dorothy lacked a little er stablemate's scale and is a bit shouldered and the Kansas cow ving dry didn't look milky enough o higher.

airfield Farms won the 4-year-old s with their Waterloo grand pion, and Alta Crest had a right first prize two-year-old in Alta st Blue Bonnet but neither was d enough to beat the old cow for or championship.

eitz showed all three of the win- juniors, their junior yearling, alier's Strawberry, placing up for or championship.

irst place in the get of sire class won by Strathglass with a Hobs- Lucky Boy get that included the d champion bull and the third e aged bull, but we liked quite as the Alta Crest entry by Morton ns Lord Barrylyndon. This latter p included Ringleader, second bull, the second prize three-year- heifer that could we thought have gone first, and the first and fourth prize two-year-olds.

The awards follow:

Bull 4 years or over—1 and 3, Strathglass on Imp. Hobsland White King and Imp. Hobsland Lucky Star; 2, Alta Crest on Alta Crest Ringleader; 4 and 5, Seitz on Cavalier's Bobby Vernon and Cavalier's Ping Pong. Bull 3 years, under 4—1, Fairfield on Fairfield Mandarin. Bull 2 years, under 3—1, Seitz on Cavalier's Bondsman; 2, Alta Crest on St. Sulpice Colonel; 3, Davidson on Springburn Sir Douglas; 4, Strathglass on Strathglass Yellow Chief; 5, Fairfield on Cavalier's Fox Trot.

Cow 5 years or over—1, 2, and 5, Strathglass on Imp. Great Cross Snowflake, White Dorothy, and Imp. Hobsland Nancy 10th; 3, Fairfield on Cacapon Lass; 4, Alta Crest on Alta Crest Spicy Girl. Cow 4 years, under 5—1, Fairfield on Cairncroft Primrose; 2 and 3, Seitz on Cavalier's Celia Louisa and Cavalier's Silver Actress 2nd; 4, Strathglass on Imp. Spittal Jingle; 5, Davidson on Allencroft Marcia. Cow 3 years, under 4—1, Strathglass on Strathglass Miss Pearl; 2, Alta Crest on Alta Crest Cheer 2d; 3 and 4, Fairfield on Pearl Stone Princess Jean and Fairfield Brown Eyes; 5, Seitz on Cavalier's Red Lola. Heifer 2 years, under 3—1 and 4, Alta Crest on Alta Crest Blue Bonnet and Alta Crest Sonya; 2, Strathglass on Strathglass Miss Violet; 3, Seitz on Cavalier's Peg in the Ring; 5, Fairfield on High Value's Brownie.

Get of Sire—1 and 4, Strathglass on Hobsland Lucky Boy and Leto; 2 and 3, Alta Crest on Morton Main's Lord Barrylyndon and Lessnessock Searchlight; 5, Seitz on Cavalier's Lord Roseberry. Produce of Cow—1, Strathglass on Nether Craig Missie; 2, Alta Crest on Holehouse Buttercup; 3, Seitz on Buttercup's Perfection; 4, Fairfield on Cloud's Brownie 2nd of Cacapon; 5, Seitz on Cavalier's Creampot of S. C. 2nd. Young Herd—1 and 4, Seitz; 2, Strathglass; 3, Alta Crest; 5, Fairfield. Dairy Herd—1, Strathglass; 2, Fairfield; 3, Alta Crest; 4, Seitz. Proven Sire Class—1, Strathglass on Leto.

Senior and grand champion bull—Imp. Hobsland White King. Junior champion bull—Strathglass Kirbo.

Senior and grand champion cow—Imp. Great Cross Snowflake. Junior champion cow—Cavalier's Strawberry.

Holsteins

Judge: Ward W. Stevens, New York.

Holsteins were down to third place in point of numbers this year; there were 184 shown, but they made a very good showing, one of the two best we've seen this year, and Judge Stevens had a busy day and a half lining them up.

In the first class shown—bull calves under a year—there was a little bit of a mix-up from the Waterloo line-up two weeks earlier. King Sylvia Ormsby Piebe from Elmwood Farm, showing improvement over his early season form, went first while Starlight Richmond Pietertje, owned by Christ & Braman, and first at Waterloo, dropped to eighth perhaps because the judge overlooked him.

The Detroit Creamery Farms' junior herd sire, DeCreamCo Calamity Posch, just about clinched a position as all-American junior yearling by winning his class and junior championship again. He looks to be the best junior bull that has been out in the Middle West this season.

The two outstanding senior bulls were King Homestead Piebe Lad, J. D. McDonald's two-year-old, and Sir Fobes Ormsby Hengerveld, the aged bull from Elmwood Farm. Each has been undefeated in class all season and there was nothing at Memphis to seriously threaten either of them. They were close competitors for senior championship and although the older bull won again we doubt if he has been so near defeat before in two years.

The aged cow class brought another upset. Colantha Hark Delaphene, from Elmwood Farm, won her class without too much trouble at Eastern States and at Waterloo, presumably because she approached the type that those judges favored. She has freshened since show day at Waterloo and although Judge Stevens found no fault with her udder, he set her down to sixth place below several cows she had beaten previously, because she wasn't just the type of cow he liked. We won't attempt to say which judge was right or which was wrong, but it looks very much as though the cow was wrongly placed at one time or the other. We had rather hoped she would win and change the custom of having a dry cow first at the National.

The winner at Memphis, Tulip Beauty, a dry cow owned by the Michigan Reformatory, was second at Waterloo. She is a well veined, milky

Wonderful New Milking Method

Milks Cows Like No Other Machine Ever Milked Cows Before

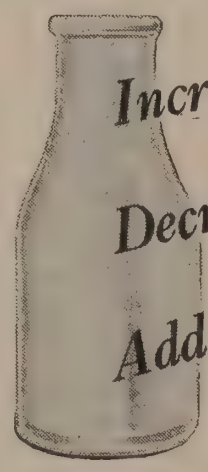
At last something really new in machine milking history! The wonderful new SURGE Milker!

A machine that is making records for Breeders who never dared use a machine before. A machine that produces low count, premium priced milk—and does it with no more work than you now give to washing milk pails. The Surge is sweeping everything before it!

Only These 4 Rubbers To Wash

Think of that! You men who have *tried* to keep old fashioned milkers clean—*mark this!* Only 4 simple pieces of rubber to wash. No long tubes. No claws. No places for the milk to lodge and breed bacteria. Easy to produce Grade "A" milk and get premium prices.

Which is easier to keep clean?



With The Surge Milker the milk travels ONLY 4 inches from Teat to Pail. With other milkers it travels through 4 feet of curling rubber tubes and twisted claws—where bacteria breeds and contaminate the milk. To produce CLEAN milk any milker must be thoroughly washed EVERY DAY. The Surge is so easy to clean that there is no temptation to slight the job.

Mail Coupon For FREE Demonstration Offer

Just mail the coupon below—*now*—and we will install The Surge Milker complete in your barn—*Free*—and show you what it will do on your own cows. No cost or obligation on your part.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Dairy Juniors Meet at Memphis

GREETINGS, Juniors, from the land of sunshine and cypress, cotton, darkies, mules, river boats, and southern hospitality. We are writing this from Memphis, Tennessee, down in Dixie, where more than 350 4-H club boys and girls from 33 states have gathered this week, October 15 to 22, at the National Dairy Show. Winners all, they have met in friendly competition, or have come as honor guests for their achievements and one and all they've had a good time.

Wish you all could have been at that 4-H club banquet tonight, which is Wednesday. Sears, Roebuck & Co. sure entertained in royal fashion, and the pep and enthusiasm of those club folks were sure inspiring. It concluded three days so chock-full of events for the young folks that it fairly made your head swim trying to keep up. While we're talking about that banquet we'll tell you something about it.

To begin with there was that delicious chicken served southern style, and, oh, so nice. There were yells and songs. A. W. Palm, South Dakota, president of the National Council of County Agents, spoke. Then there was G. L. Noble, secretary of the National Committee on Boys' and Girls' Club Work, and I. W. Hill in charge of the southern states from the United States Department of Agriculture, who has been doing 4-H club work since 1912 and making a great record, and C. L. Hill, president of the National Dairy Exposition. E. M. Harmon, editor of The Dairy Farmer, who judged the 4-H club demonstrations, announced the winners. Jesse Billyeu of Nebraska spoke for the boys and Marguerite Stoner of Tennessee spoke for the girl club members. W. D. James of the James Mfg. Co. presented winners of championships in the calf club exhibit each with a bull staff. George Biggar of Sears, Roebuck & Co. was toastmaster, and G. L. Herrington, Tennessee state club leader, led the whole list of minute men speakers. Mr. Herrington, you know, was one of the hosts, in fact he was the head man at the 4-H club camp out on the Tri-State fair ground, where the Dairy Show was held. The banquet was a mighty success.

This afternoon—today is Wednesday—several busloads of boys took a long ride out into Shelby County, where Memphis is located, and we all got a good slant at dairying as it is in this country, cotton growing, ginning, and marketing, and farming conditions in general. To us from the North it was a real treat to inspect a cotton gin. And at one place where we stopped what do you suppose we found right beside the gin? A creamery. And what do you think of that? Oh, yes, the creamery had been there four years. And they gave us a drink of nice, rich, Jersey milk and one of those famous little vanilla cakes at the Chickasaw Creamery at Bailey, Tennessee, and some nice little souvenirs, besides, including a cotton boll.

We visited three nice dairy farms —Jerseys on all of them. On one of them they told us they grow about six tons of alfalfa to the acre and get five cuttings a year. We tramped on pastures of thick matted lespedeza. We picked pecans, persimmons, and fresh figs. To many these were new and unusual experiences. We saw as fine equipment as you could wish on the Duntreath Certified Dairy Farm where well over 100 head of Jerseys and a herd of goats turn southern sunshine, fresh air, grass, and feed into wholesome, nutritious milk. We saw cotton and cows on the same farm and the cotton crops are bigger and better now than they were before the cow came bringing diversified farming and adding humus to a soil so depleted of this element that in places it must be terraced to keep it from gullying, eroding, and washing away.

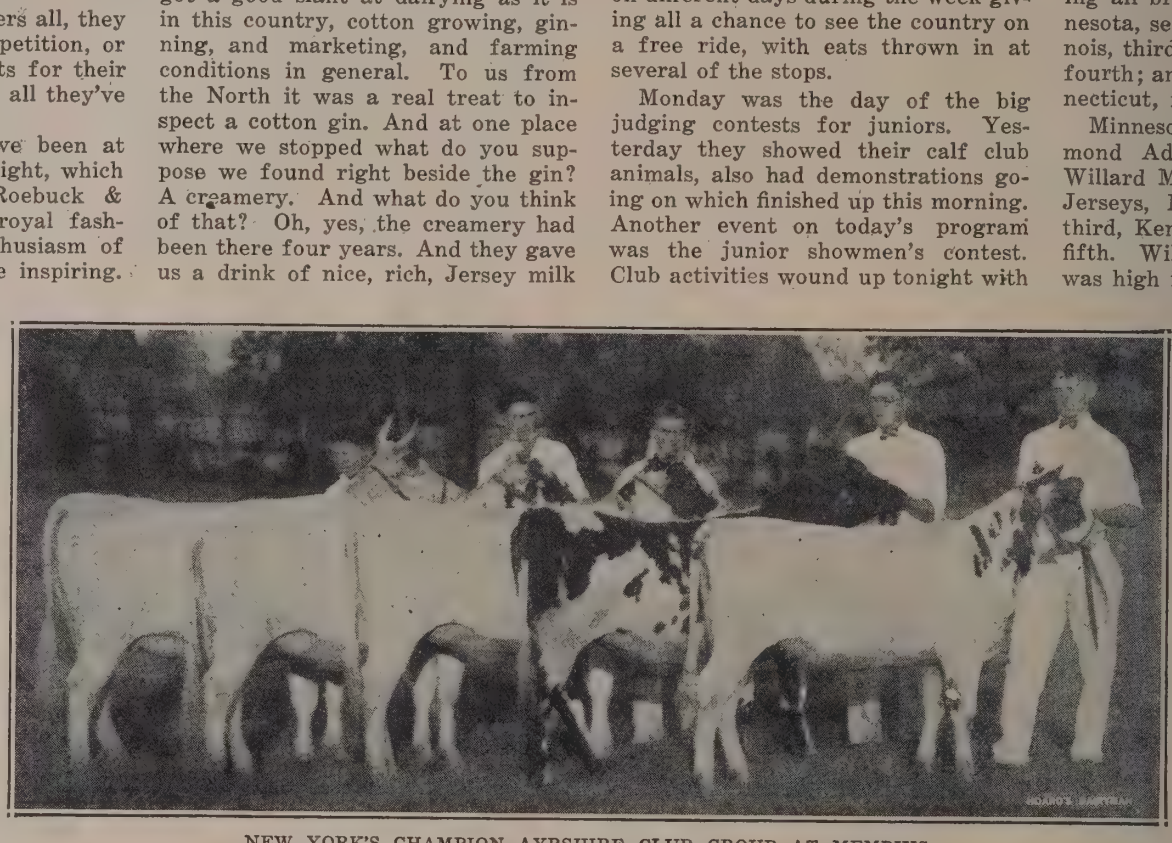
We are glad that this opportunity was arranged for the juniors and other visitors to get out into the country. Trips of this kind were made on different days during the week giving all a chance to see the country on a free ride, with eats thrown in at several of the stops.

Monday was the day of the big judging contests for juniors. Yesterday they showed their calf club animals, also had demonstrations going on which finished up this morning. Another event on today's program was the junior showmen's contest. Club activities wound up tonight with the banquet and many of the boys and girls are now pulling stakes for home, because it takes some of them two days, maybe three, to get back.

There were two junior judging contests going on at the same time in the same ring on Monday, 4-H club teams from 26 states and vocational agriculture students' teams from 32 states. They were busy, too, and we don't mean maybe. Results of the 4-H club contest will be published later.

The winners of the vocational students' judging contest were announced last night, Tuesday, by C. H. Lane, chief of the agricultural education service of the federal board for vocational education at a big banquet of contestants and coaches. Governor Henry Horton of Te see spoke to the boys, too.

A team from the "Show Me" Missouri, won first in judgin breeds. Members of the team Fritz Hackaday, Edwin Miller Baker Lamar. Charlie T George Guest, and Victor Br the Texas team, came in second ginia third—T. Miller, John Tu and Tom Woody; Illinois fourt Massachusetts fifth. Charlie T of Texas was high individual in ing all breeds; Willard Maland, nesota, second; Laverne Johnso nois, third; Fritz Hackaday, Mis fourth; and Robert Lawrence of necticut, fifth.



Minnesota's team composed of mond Adams, Nestor Pentius, Willard Maland, was first in ju Jerseys, Missouri second, Okla third, Kentucky fourth, and Vi fifth. Wilbur A. Branson, Kent was high individual followed by Nelson, Oklahoma, ard Smith, Kansas, Hackaday, Mis Raymond Adams, nesota, and Edwin er tied for fifth.

Texas won firs judging Holsteins. composed of Law and Clarence Parke Walter Fuller, was ond; Illinois third, sachusetts fourth, Maryland fifth. Cu Taylor, Texas, was individual followe Browning Knight, nois, Lawrence Pi LeRoy Miller, Pen vania, and W. S. M Oklahoma.

In judging Guer the teams finished i t order, Texas, Pen vania, Minnesota, necticut, and Illinois; and the n viduals in this order—Willard M land, Minnesota; Robert Cutter, sachusetts; Ray Collar, Mich Walter Fuller, Iowa; Donald u mings, Connecticut.

Missouri composed of Fritz H day, Edwin Miller, and Baker L took first honors judging Ayrs Massachusetts with Robert C Rudolph Merten, and John Hil placed second; and Florida, Geo and Connecticut finished in the named. Norman Updegrove of I sylvania was the first individual lowed by Fritz Hackaday, D Cummings of Connecticut, Cl Taylor, and Randall Lining of

ry Shows. South Dakota won first e, Minnesota second, Michigan d, Nebraska fourth, Missouri fifth, a sixth, Wisconsin seventh, Ten- see eighth, Georgia ninth, West ginia tenth, Arkansas eleventh, Kentucky twelfth. The South ota team was composed of Ken- Heneghan and Raymond Olson harge of Gerald Heebink, South ota Agricultural College. The ject of their demonstration was eam Separator Care and Adjust- nt."

Ve haven't told you about what pened Tuesday at the supper table afterwards, have we? To start meal off right, G. L. Herrington a song or two, and the cheers he brought him back for encores. n after everybody was finished ng, there was a delightful period wenty minutes with James Speed, or of the Southern Agriculturist. Speed took all the 4-H club folks it back on the farm with his real- imitations of animals and birds,

the Memphis Y. M. C. A. judged the stunts and helped direct the club camp.

There were two outstanding features of the calf club department. One was the splendid Jersey showing in which Tennessee took plenty of honors. The Jersey club classes were the biggest of them all. The other was the sweeping victory of Wisconsin club animals in the Guernsey and Holstein classes. Finishing first and second with their two entries in the group class and taking first and champion with two individuals, the Guernseyway Calf Club of Fort Atkinson, Wisconsin, J. C. Ralston, leader, took all the high prizes that it was possible for them to win. Their exhibit showed plenty of quality and class and attracted much deserved attention at Memphis. The Ideal Holstein Calf Club of Jefferson County, Wisconsin, Charles Clingan, leader, defeated New York, in the group showing and placed second to New York for individual championship. New York won the Ayrshire group and was represented by good calves in all the breeds. New York was the only state to enter in all the breeds, a record worthy of special mention.

Judging in the calf club department was done by C. H. Staples, Louisiana.

Ballard & Ballard gave ten sacks of feed to owners of winning animals in the calf club classes.

In the Junior Showmen's contest the following winners were declared: Jerseys—Dallas Batcheldor, Georgia; Guernseys—Orin Anderson, Wisconsin; Holsteins—Ward Winsor, New York; Ayrshire—Wendell Wicks, New York; grand champion showman, Wendell Wicks.

State Club Leaders G. L. Herrington, E. G. Jenkins, Maryland, and T. A. Erickson, Minnesota, are members of the advisory committee on 4-H club activities at the National Dairy Exposition and to them goes the credit for the success of the 1927 junior department at Memphis.

When buying mention Hoard's Dairyman to your merchant or dealer—it helps us!

"Let's Join the Juniors!"

"C'mon Gang, what do you say? Look at those emblems! That watch fob is just what I need! We always wanted to belong to a club, and here's our chance. It says here, 'If you are a regular reader of the junior department and some member of your immediate family is a regular subscriber to HOARD'S DAIRYMAN join the HOARD'S DAIRYMAN JUNIORS' CLUB. It's free!' Of course we're regular readers of the junior department. Wouldn't miss a single issue, would we, fellows! Dad's taken HOARD'S DAIRYMAN as long as I can remember. Let's join the Juniors right now! Are you with me?"

You bet, they're with him!

So are thousands of other boys and girls the world over. And so are you. Sign and mail the membership application NOW. You want to join this great big club of up-and-doing young men and young women. The age limit is 20 years and some member of your immediate family must be a regular subscriber to HOARD'S DAIRYMAN. Your emblems—a watch fob, button and creed—are waiting for you!

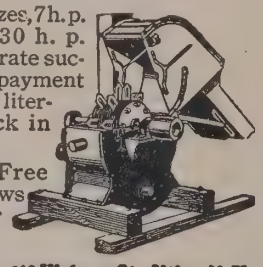
You Can't Beat the Old Reliable

JAY BEE Humdinger
CRUSHER GRINDER PULVERIZER

For fine, fast, uniform grinding of every kind of feed, biggest capacity, lowest grinding cost per ton, absolute dependability at all times, freedom from breakage and costly repairs, you can't beat the **"JAY BEE."**

Not 1c for Repairs in 5 Years



Mount Meadow Farm, Gadsden, Ala., writes: "We have never spent 1c for repairs nor have we had a shut-down for one minute with our **'JAY BEE'** in 5 years. We grind practically everything and got baling wire, nails and the like into the mill which have failed to damage the mill one bit.

"Has Never Failed Me"

S. Shipman, Guide Rock, Nebr., writes: "I have ground more than 15,000 bushels of corn and at least 400 tons of hay and fodder, and haven't spent a dime on my **HUMDINGER** yet. One sure thing, when you are feeding full feed, a breakdown and waiting for repairs costs lots of money. My **HUMDINGER** has never failed me yet."

Free Feeding Booklet

Nothing to wear dull or break. Grinds the feed cool. Over 7,500 in use. The best mill—cheapest when work is done. 3 sizes, 7 h. p. to 30 h. p. Fordson will operate successfully. Easy payment plan. Descriptive literature free. Stock in principal cities.

Send for this Free feeding book. Shows way to greater feeding profits.

J. B. Sedberry, Inc., 268 Hickory St., Utica, N. Y.

CHEAPER POWER

Sizes 2 to 30 H-P.

Witte Super-Hopper All Fuel Engines

Deliver power far in excess of rating on the cheapest fuels with new All-Fuel carburetor which is a proven money saver. Removable die cast bearings, alloy steel construction, hot spot cylinder head, complete with WICO Magneto and new (Pat. applied for) tripper. Scrap your old engine—pay a little down on a new WITTE—let the engine earn the balance. Send for my EASY PAYMENT PLAN on engines, log and tree saws, 3-in-1 saw rigs and pumpers. ED. H. WITTE, *Pres.*

Little Talks for Juniors

Friendship. Is there anything more to be desired than friends? We doubt it. Of what use are all the riches in the world if you have not friends?

Something sacred about that word, friendship. Kind of gets you—takes right hold around the heart strings and won't let go—a great feeling.

"He's my friend," said a youth. Wonderful, lad! Great Stuff! Friends bring happiness.

Did you ever go away from home, miles and miles away where you're sure nobody knows you from Adam's off ox, and have somebody come up and slap you on the back booming out "Hello, Tom, how are you, old boy? Gee, I never expected to see you here." Thrilling—oh, boy! Beats an aeroplane ride a thousand ways.

The fellow with many friends, the fellow to whom friendship is a sacred and revered word, he's the fellow to be envied, and he has every reason to make good. Make friends, good friends, and hold them, and you'll be rich all your life.

Our Review Column

[A regular feature of the junior department, reviewing the contents of Hoard's Dairyman for the previous issue. Let's talk it over.]

For further discussion of the following see the October 25th issue.

How many dairy herd improvement associations are there in the United States? A report recently issued by the Bureau of Dairy Industry states that there are now approximately 900 active associations. (See "Problems in Herd Improvement.")

What are some of the problems in herd improvement? Inadequate rations, inferior animals, indifferent members, and inefficient testers. If every member of the 900 associations would provide at least one acre of legume hay for each animal in the herd and feed a balanced grain ration based on the daily milk flow, there would be a big increase in the income above feed cost.

How much milk is handled by the Seattle Milk Shippers' Association? Between 65 and 70 per cent of the total milk supply of Seattle. The association is in its seventh year of operation. (See "Seattle Milk Shippers' Association.")

How is quality milk produced for the association? Each dairyman is scored. Milking barns must be sealed if there is hay overhead; no manure may be dropped nearer than 50 feet from the barn; the gutters must be tight; the stable must be washed or sprayed with whitewash; cobwebs must be brushed down; udders should be cleaned with washing cloth; covered milk pails must be used; and dairy utensils must be sterilized.

How much did Hollyhock Holsteins sell for? The dispersion of Gustav Pabst's Hollyhock Holstein herd at Oconomowoc, Wis., brought an average of $835 for 108 head. Nineteen went for $1,000 or more; 3 brought more than $5,000 and one cow sold for $10,000. (See page 1019.)

What is a good winter ration for growing heifers? Good quality legume hay, 10 to 15 lbs. of silage, and a grain mixture of 100 lbs. each of ground corn, ground oats or barley, and bran, and 25 lbs. of a high protein feed. From 2 to 4 quarts should be fed daily. (See page 1002.)

Why and how should pullets be culled this fall? Pullets should be culled to cut down the feed cos unprofitable birds during the w and to make a more uniform sy of management for the flock. A pullet should have body length depth, a bright, clean-cut head, plenty of vigor, growth, and vit (See poultry department.)

When was the Pioneer dairy improvement association organiz Minnesota? The oldest D. H. I. the Gopher State was organize Freeborn County in the sprin 1910 and started by Tester H. C. Murray, who has served every but one.

ROBERT SEITZ, WISCONSIN, AND CHAMPION AYRSHIRE CALF CL ENTRY, MILKMAID OF MONTDAI

Junior Letter

A Club Song

Hoard's Dairyman Juniors:—I have a club song here that I am sending you:
(Tune: "It Ain't Gonna Rain No Mor

CHORUS
Oh, we don't want to leave the old home
We don't want to leave any more.
The greatest fun is work well done,
We don't want to leave any more.

PIG CLUB
You folks can have your hens and shee
Your cattle, small and big;
The thing I want to do just now
Is raise the first prize pig.

POULTRY CLUB
Our chickens bring us lots of dough,
The poultry members said;
We sell the eggs before they're hatched
And dress them when they're dead.

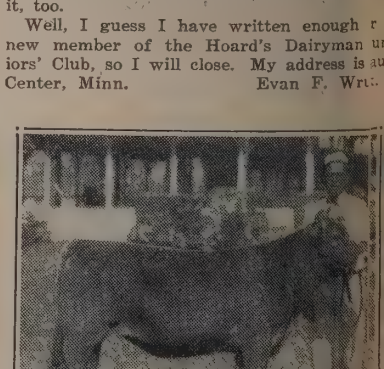
DAIRY CLUB
I'll feed my calf some corn and oats,
And sweet alfalfa hay;
She'll pay me well for feed and care
And make a herd some day.

SHEEP CLUB
Oh, some folks like the dairy
And others hogs will keep,
But as for us, we'll make our pile
By raising pure-bred sheep.

SEWING CLUB
You other girls can have your calves,
Your poultry, pigs, and spuds,
You'll all be green with envy when
You see our Easter Duds.

CANNING CLUB
We can can candied cantaloupe,
We can can succotash,
We can can all you kids can raise
And sell it quick for cash.

BREAD CLUB
We do not care for calves and pigs
Or chickens 'til they're dead;
We'll play our game and win our fame
With choicest home-made bread.



GARDEN CLUB
Oh, some folks like fresh cabbage,
Or carrots, peas, and greens,
We'll raise you anything you want
From salsify to beans.

ORCHARD CLUB
We're experts with the pruning knife,
We know just when to spray,
We'll raise your berries, apples, plums
The scientific way.

—H. A. Sip.

I was 11 years old the 27th of March. I did not make up this song, but I sent it in be I thought you other boys and girls would like it, too.

Well, I guess I have written enough new member of the Hoard's Dairyman Juniors' Club, so I will close. My address is Center, Minn. Evan F. Wri

CHARLES GOODWIN, NEW YOR AND HIS CHAMPION BROWN SWI CALF CLUB HEIFER, EUTHAL'S EULAINE

lerd Sire's Part in Reproduction

W. W. WILLIAMS, MASSACHUSETTS

HE statement that a bull is one-half of the herd is quite frequently put forth but its signance little appreciated. When in , a bull's efficiency is usually ed by his conformation, type, gree, and his prepotency or abili- transmit certain desired breed acteristics to his offspring. As rtant as these various considera- may be, they become of second- importance to the breeder when ven bull fails to impregnate the which he serves and there are breeders of wide experience who not been without the occasion of nating herd sires because of .

any such eliminations of impo- bulls concern animals whose grees, type, etc., would mark as high class breeding animals such eliminations are usually e only after the group of cows ed has either failed to conceive as delivered weak or immature es. Regardless, however, of the elimination of bulls because of ding inefficiency, there has been a ral tendency to absolve the bull the various reproductive losses which he is connected, owing aps first to the time-worn adage the male is always healthy; and, dly, to the general opinion gst laymen that all or almost all oductive troubles are due to B. tus or contagious abortion.

step further in the process of oning leads the mind to the con- on that since contagious abortion affects the pregnant animals, the bull is immune from this con- n, he is therefore absolved from important responsibility in the er of reproductive losses,—rath- ratic logic but yet judging from ent writings a conclusion into h more than one enthusiast in the gun elimination of abortion has bed.

ith the purpose of clearing up of the less understood causes of tion and sterility, studies of dis- of the bull and the relation that diseases bear to reproduction commenced in 1919. Part of this stigation was conducted by Dr. . Williams of Cornell University later comprehensive and impor- information has been accumulat- y Dr. Alfred Savage of the Mani- Agricultural College who for the a three years has been conducting stigations along this line under a t allowed by the Canadian Re- ch Council for this purpose. The of work has centered in deter- ing the relation of the health of spermatozoa upon reproduction.

seems opportune that the breed- should have some information erning these investigations for they have developed a practical bearing in the matter of reproduction, first by showing that demonstrable disease of the spermatozoa of the bull is often the cause of abortion and sterility and further pointing out that normal and efficient reproduction cannot be anticipated unless a healthy male cell (spermatozoon) unites with a healthy female cell (ovum). To date, over 400 herd sires have been studied and it has been found that over one-tenth of that number have been sexually inefficient on account of disease of the germinal cells.

At the present time, extensive investigations are under way (paralleling the work referred to) upon the spermatozoa of stallions, man, and rooster. I am advised by the investigators that similar disease changes are noted in the spermatozoa of these species as occur in the bull and result in like disturbances of reproduction.

It has been shown that good breeding bulls emit spermatozoa that are very uniform in size and shape. When diseased spermatozoa are present in too large quantities, there is invariably trouble with the bull either by his failing to impregnate the cows that he serves or by the production of immature calves.

The examinations are made upon semen which has been smeared and dried on a microscope slide. Preparations thus made will keep for examination indefinitely. The spermatozoa are then stained and examined for abnormal or disease forms under a magnification of about 1,000 diameters. They are then magnified to 3,000 or 4,000 diameters and measured. From the information thus gained, one is enabled to estimate the health of these cells and thus the fitness of the bull for service.

This method of examination has provided an available means by which the potency of a bull can, to a large measure, be predetermined. It is particularly valuable in determining the health of young bulls before they are put into service, in clearing up the cause of outbreaks of abortion and sterility, and as a breeding warranty in the purchase of herd sires. Changes in the spermatozoa of the bull are not produced rapidly as a rule. Thus a careful examination of the spermatozoa when done as a matter of routine upon herd sires furnishes a valuable means of the prevention of breeding trouble, for it will often pick out important disease changes in the spermatozoa before sufficient time has transpired to allow these changes to be reflected by poor breeding of the cows. Where high class breeding stock is at stake, the elimination of the sexually unfit is of great importance.

Feeding Milk Goats

ARD'S DAIRYMAN:—"The cost of e ing my Toggenburg milk goats a es from season to season accord- to the price of feeds," says R. C. I. s of Kearney County, Nebraska. I ersonally like third and fourth u ngs of alfalfa used in the form f eal. I mix this with corn chop n equal parts of bran and oats. I a pen this feed and they greatly e h it. I never feed more than they a clean up as they love to be fed f n. In cold weather a warm bran n once a day is appreciated."

r. Mars says that he always pan- e s the kids, never allowing them o urse. When about two hours old they are given their first feed. By taking the kids from their mother at birth they can be turned in with the mother at a week old with perfect safety as she will not allow them to suckle.

For housing the kids, Mr. Mars has a building, six feet high in the front and 4 feet high in the back and 20 feet long, covered with ship lap, tar roofing, and shingles over the top, thus making it storm proof. It is partitioned off in five compartments. The whole front is set with glass, the floor is of concrete and during even the coldest of winter weather the kids can enjoy the warmth of the sun's rays in perfect comfort.

Nebraska. H. H. BIGGAR.

The Farmers' Best Investment

TEN years of increasing strength of the Federal Land Banks have made their Bonds a seasoned standard investment. Not a default on interest or principal. Over one Billion dollars of these Bonds now held by investors. They are guaranteed jointly by the twelve Federal Land Banks, with combined capital and reserves exceeding $70,000,000. Back of these Bonds are farms valued at more than twice the amount loaned. These Bonds are safer than any single first farm mortgage.

Federal Land Bank Bonds

Completely Tax-Exempt

You can buy Federal Land Bank Bonds at the current market price from any Federal Land Bank or from the Fiscal Agent. Denominations: $40, $100, $500, $1,000, $5,000 and $10,000.

When you need money these Bonds can be readily sold; and they make acceptable collateral.

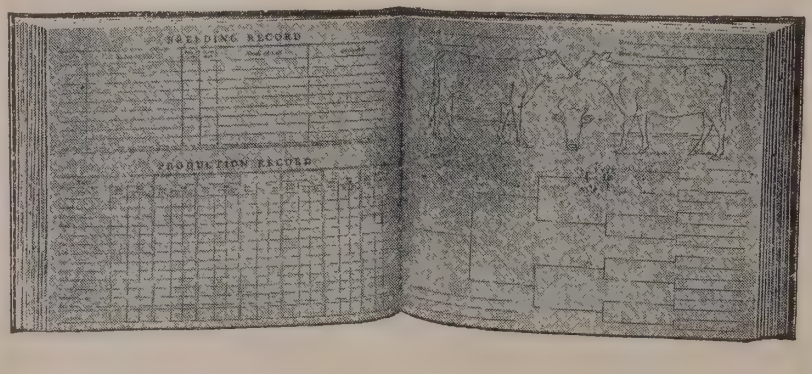
Mention Hoard's Dairyman to Your Dealer — It Helps Us

For Breeders of Purebred Dairy Cattle



The Hoard's Dairyman Breeders' Record Book is getting more popular every day among breeders who want a neat, handy, handsome book in which to keep

permanent records of their cows. Many breeders tell us they are as proud of their book as they are of their cows—and for a dyed-in-the-wool cow man, that's "going some".

It IS handsome—and practical. We are proud of it. We would like to sell one to every breeder in the country.

It consists of 96 pages, nicely bound in a high quality cloth cover. Each page numbered, and an index in the front of the book. No delay in finding what you want.

Each page has space for—

A SKETCH OF THE COW
FIVE GENERATION PEDIGREE
PRODUCTION RECORD BY
MONTHS FOR SEVEN YEARS
BREEDING RECORD

PRICE $2.50 Postage Prepaid

NOTE

We will be glad to forward you this book without charge if you will get just three of your neighbors to give you $1.00 each for a three years subscription. If you find Hoard's Dairyman helpful, why not tell your neighbor about it.

HOARD'S DAIRYMAN FT. ATKINSON WISCONSIN

DAIRY MARKET NEWS

The Feed Market Situation

(By the Grain, Hay, and Feed Market News Service, Bureau of Agricultural Economics U. S. D. A.)

Present indications point to a smaller supply of feedstuffs and feed grains than a year ago although plenty of hay will be available on the whole. Most of the reduction is accounted for by smaller harvests of corn, oats, and cottonseed this year although the smaller crop of corn is partially offset by an increase in barley and grain sorghums. Corn production is expected to be about 44,000,000 bushels under last year's figure while considerably less old corn is on hand than a year ago. Both the oat crop and the carryover of oats are smaller than in 1926 while the reduction in the cotton crop this year suggests that only about two-thirds as much cottonseed cake and meal may be produced as in 1926—27. The higher prices prevailing for cake and meal this year, however, will doubtless reduce exports to some degree.

Wheat feeds were barely steady during the past two weeks with shorts and the heavier feeds weaker than bran at some points. Production has been of fair volume as indicated by flour output at milling centers but still is slightly below that of a year ago. The output in the Northwest reflects the larger wheat crop available in that territory this year and feed prices there were relatively easier than in the Southwest. Bran made a fractional decline at Minneapolis but was practically unchanged at Kansas City and eastern markets. Middlings were also draggy at Minneapolis but were relatively steady at Kansas City where this feed met a fair demand from the South while prices at Buffalo and Philadelphia were quotably unchanged.

Cottonseed meal prices are practically the same as two weeks ago with a slight reaction following a fractional advance. The cottonseed movement for the first two months has been heavier this season than last in spite of the smaller crop this year. About 331,000 tons of cottonseed meal were crushed during August and September or nearly 82,000 tons more than for these months last year while shipments have been only around 20,000 tons larger than a year ago. This has tended to offset the reduction of nearly 80,000 tons in the carryover into this season and stocks of cake and meal on October 1 totaled nearly 110,000 tons compared with about 127,000 tons a year back. Holdings of cottonseed at mills at that time were about 10 per cent larger than a year ago.

Linseed meal prices have been irregular with western markets firmer than eastern points. Demand fell off at Buffalo and prices declined materially. Crushers there were more anxious for business but were endeavoring to prevent further declines. Prices met a fractional decline at Chicago but were quotably 25c higher at Minneapolis where large purchases had been made at a low point about midway in the season when the market had been rather weak. After these sales, mills had only small amounts of meal to offer and were holding prices firm.

Hominy feed prices turned sharply lower in sympathy with the weakness in corn while it appeared that a number of buyers were holding off in the hope of future shipments. Mills have been anxious to sell and have been pressing the market. Movement of this feed has appeared rather heavy but stocks seemed of only fair size.

Alfalfa meal held steady on limited offerings of choice quality meal but the lower grades made fractional declines. Because of the unusually heavy rains over much of the alfalfa meal producing territory during the time of alfalfa cutting much less than the usual amount of best grade hay is available there for grinding into meal.

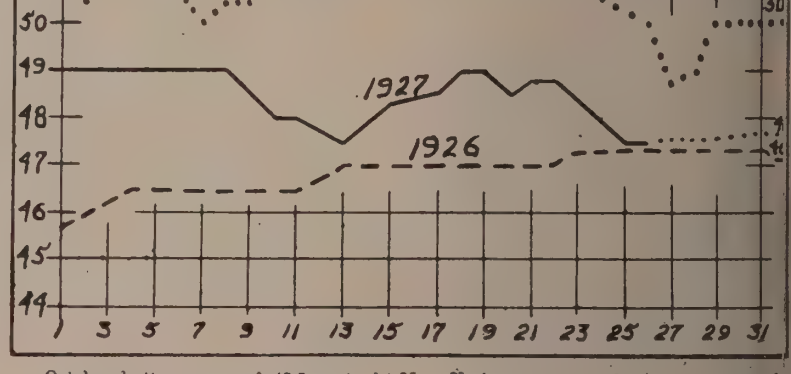
Tankage prices are the same as a month ago. Although quotations were reduced earlier in October, demand seemed active at the reduction and prices were advanced to t mer level late in October.

Quoted Oct. 26

Standard spring wheat bran: $25.25 apolis, $28.50 Buffalo, $33 Philadelphia Chicago. Hard winter wheat bran: Omaha, $25.50 Kansas City. Soft winte bran: $34 Philadelphia, $31.50 Cin $27.75 St. Louis.

Standard wheat middlings: $29.50 $33 Philadelphia, $29.25 Chicago, $26.25 apolis. Soft wheat middlings: $40.50 $36 St. Louis. Gray shorts: $32.50 $32 Kansas City.

Cottonseed meal (43%): $47.25 Phila $43.75 Cincinnati, $44 Chicago, $43 City, $37 Forth Worth.



Linseed meal (34%): $46 Buffalo, Cincinnati, $47.25 Chicago, $45 Minn

Gluten feed: $39 Buffalo. White feed: $36.25 Buffalo, $33.50 Chicago. meal: $26.50 Chicago, $23 Omaha, and Kansas City.

League September Pr

The New York Dairymen's League September a net pool price of $2.75 pounds of 3.5 per cent milk in the 20 mile zone, with the usual freight and ferentials. This is the highest Septembe in the history of the farmers' co-operat ganization, and has been surpassed b two other months.

In announcing the price the Dair League warns producers of the New Shed that they must exert every ef

October butter averaged 48.5 cents in New York, as compared with 46.9 cents l year and 50.9 cents two years ago.

Twin City September M

The Twin City Milk Producers' Assoc of Minnesota paid $2.48 a hundred fo milk delivered in St. Paul during Sept The association handled 19,664,871 lbs. m which 35% was surplus.

Cream patrons were paid 52 cents a o for butterfat in first grade cream durin tember. This is 5.5 cents above the a price of 92-score butter on the New market.

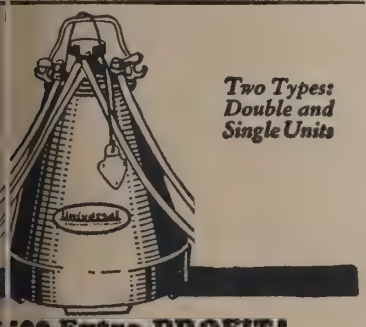
Connecticut October Milk



The Connecticut Milk Producers' Association announces the following prices for Grade B milk delivered during October at market milk centers:

All milk sold in fluid form, 9.5 cents per quart for 4 per cent milk, and 4 cents per point allowed for other tests; all milk made into cream that is sold in fluid form, 22.5 cents per pound fat above the average monthly price of 92-score butter on the Boston market; all milk made into butter, at a price per pound fat equal to the month's average on 92-score butter in Boston.

Butter and Cheese in October

Butter averaged 48.5 cents in New York for the first four weeks in October, an advance of 2.3 cents over September. This is about midway between the average of 46.9 cents in October of last year and of 50.9 cents in 1925. Storage holdings at the four principal markets have been reduced during the month by over ten million pounds, which is a withdrawal of over a half million pounds greater than occurred last year. Despite this greater reduction, storage holdings are nearly a million pounds greater than a year ago and this may

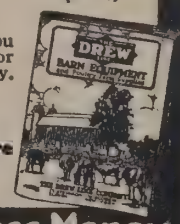
4 Big Reasons Why

DREW LINE WATER BOWLS
Are the Best and Cheapest to Buy

Sooner or later you are going to install water bowls for your cows — because water bowls will increase your milk production from 20% to 25%.

Any water bowl you buy will supply your stock with water — but only in the DREW "STASFAST" Water Bowl will you find all the features illustrated above. It is removable. That makes it easy to clean. Yet when it is locked into place it is absolutely rigid as if bolted there — will not rattle, twist, turn or work loose.

And the valve is so built that either a top or bottom feed pipe can be used. Why be satisfied with anything less when the Drew Line, true to its motto, offers you a better water bowl for less money. (D-18)



Drew Line Barn Book Free

Don't buy water bowls or any other kind of barn equipment until you get the Drew Line Barn Book and the name of our nearest dealer. For 27 years the Drew Line has been the best equipment for less money.

More profit per head with this Free Book

Why work so hard to make a few dollars, when modern feeding methods will do part of the work for you? This free book tells you how to feed dairy cows (and other farm stock) so that each animal yields you a bigger profit, and fewer head are necessary to make a good living. Helps you get higher production out of your farm-grown feeds, through home-mixed rations including Linseed Meal.

This book contains simple, practical rations that work. Thousands of copies in daily use. We will gladly send you one, free! Mail the coupon.

Need several farms immediately. Must be close to school. WALT. MILLER, Carpenter Bldg, Milwaukee.

FARMS FOR SALE

For Sale—I own the following Wisconsin farms and will sell them cheap as I live in Oregon and want to dispose of my Wisconsin holdings; 80 acres improved farm with good buildings, about 40 acres under the plow 3 miles west of Stetsonville; 35 acres, good buildings, about 15 acres under the plow in the city limits of Medford, above farms in Taylor County, Wisconsin. The following are in Clark County, Wisconsin, 134 acres good buildings, this is an extra good farm, about 80 acres under the plow, 3 miles west of Abbotsford; 60 acres one mile from city of Colby, about 20 acres under the plow, small house. For particulars address BERT WELLS, Box 28, Roseburg, Oregon.

325 Acres Premier Dairy Co. 4 horses, 26 fine cows and young stock, pure-bred bull, tractor, milking machine, hay loader, grain drill, gas engine and buzz saw, full complement machinery, vehicles, harnesses, crops hay, corn, oats, potatoes, etc.; usual hay cut 125 tons, pastures 50 cattle, stream watered, 40 acre timber and woodlot, 225 acres splendid machine worked fields,, good 10-room residence, 2 dairy barns with cement floors, 40x65 and 32x70 ft. with 41 stanchions, silo, tenant house and stable; buildings painted this year. Monthly milk income recently around $300. Here's a grand farm and a money-maker; only $12,000, terms arranged. Folder this and other bargains from W. H. MAYNARD, Strout Agency, P. O. Bldg., Canastota, N. Y.

Because of poor health will sell my 370 acre model dairy farm. Will carry 40 cows. Nicely located in fertile valley, Central New York, hour's drive from Syracuse, a great produce market. Mile from milk station, paying highest quotations, near trunk line State road open during winter. Beautiful 12-room, stucco house with modern conveniences. 100 ft. basement barn, concrete floors, feed room connecting three silos, 100 acres growing timber will soon pay for farm at only $13,000, much less than buildings cost. Only $3,000 down, balance your own terms. Immediate possession. Act quickly, "Nuf sed." F. E. SAUNDERS, DeRuyter, N. Y.

We Want More Factory Patrons. Mason County, Mich., admirably adapted to dairying, offers many inducements to new settlers. Low priced farms are still available. The largest cheese factory in the State is located in this county. Operating twelve months in the year, it provides an outlet for your milk at remunerative prices. Investigate the possibilities of this county before locating elsewhere. We have no land for sale but will be glad to assist prospective buyers in finding satisfactory locations. For further information, write to Dept. A, KRAFT CHEESE CO., Scottville, Mich. 18-4

Dairy Tenant Farmers of Wisconsin and Minnesota: An opportunity awaits you in the famous Yakima Valley. Alfalfa, corn and pasture produce an abundance of cheap feed. Excellent markets for dairy products and surplus stock. Mild climate, good churches and schools, paved roads, two railroads. Agricultural products last year from this valley valued at $43,000,000. If interested write us and we will tell you more about the opportunities here for dairymen. S. E. CHAFFEE, Chairman Agricultural Com., Sunnyside Commercial Club, Sunnyside, Wash.

Dairy Farm—320 acres Jefferson County, Kansas, 3 miles market, town 500, good high school, good road, 40 miles Kansas City, mostly hard surface, balance completed soon. Land high state cultivation, all smooth, gently rolling, well watered. Blue grass pasture, alfalfa, corn, oats produce well. All kinds fruit, large dwelling, water and electric lights, 3 good barns, 2 silos. Good milk market, condensery. Financed long time loan, priced at great sacrifice by owner. Address BOX 558, care Hoard's Dairyman. 21-2

244 acres for large family. Everything complete; tractor, horses, cattle, furniture, all crops, full line machinery, 3-section tractor harrow, milking machine, gas engine, etc., included; 160 acres tillable; good 9 room house and bathroom, furnace; tenant house, large basement barn, near advantages and shipping point. For Sale—140 well improved, good house, in sunny Washington. Write for information. NEIL GORDON, Usk, Washington.

FOR RENT

Wanted—A dairy farmer, who would be interested in developing a herd of pure-bred, high producing cattle, mostly Holsteins, and who knows how, to rent my half-section farm in South Dakota, on a 50—50 basis. I will furnish the cattle which are already on the place and include heifers from dams with records up to 1175 pounds of butter and 29,000 of milk in a year. Renter must be able to buy the horses and machinery on the farm, and a half interest in 45 ewes and some sows and also half the feed, and be able to stand the strictest investigation as to his honesty and ability. Possession given March 1, 1928. EDWIN T. RAMSEY, Clark, S. D.

Renters Wanted—Write for free books and list of improved farms for rent in North Dakota and Minnesota, productive for small grains, clover, alfalfa, dairying, cattle, sheep and hogs. Good schools, markets, churches in fast developing communities where land can be purchased on easy terms. Low homeseekers' rates every Tuesday. Go now and see the harvest. E. C. LEEDY, Dept. 682, Great Northern Railway, St. Paul, Minn. 17-*

For Rent on Shares—240 acres, forty miles from Chicago. Large barn, three silos, other buildings. Woven wire fence. 25 acres of new alfalfa seeding; 100 acres of sod manured this fall. Some fall plowing. Equipped for dairy or feeding. Will furnish stock and machinery. W. H. SCHENDORF, 1340 E. 63rd St., Chicago, Illinois.

Dairy farm 6 miles from Columbia, near concrete highway. Good buildings, good water supply, productive soil, 200 acres, 90 acres in bluegrass. W. K. FREUDENBERGER, Columbia, Missouri.

Butter and Cheese in October

(Continued from page 1075)

art account for the erratic course of s.

eese markets continue their advances and a striking contrast to butter. The October ge on the Wisconsin boards is 26.75 , and the market shows a tendency to ad- further. This is not only the highest paid for October cheese since 1919, but highest in relation to the price of butter. he past several years October cheese on Visconsin boards has averaged to be less 50 per cent of the price of 92-score butter e New York market, but this year the er cheese price is 55 per cent of the but- rice.

)ctober Condensed Milk

ort by U. S. Department of Agriculture) ces paid producers for 3.5% milk f. o. b. ry were as follows for October, covering factories manufacturing both case and goods:

raphic tion	Price per cwt. Range	Ave.
England	$2.30	$2.30
le Atlantic*	2.32—3.00	2.64
North Central	2.01—2.40	2.16
North Central	1.89—2.05	1.99
Central	1.89—2.00	1.95
Western	1.85—1.94	1.89
Western	1.84—2.15	1.94
ed States	1.84—3.00	2.15

ifty-nine additional factories reported s based in part on current month's whole- butter quotation. Twenty-five factories ted prices not determined as yet and 20 ted factories closed.

nufacturers' wholesale selling prices for ened condensed and unsweetened evapo- milk were as follows for September:

	Range	Ave.
ensed, per case	$5.60— 6.65	$ 6.28
ensed, per cwt.	9.25—13.00	10.38
orated, per case	3.37— 5.20	4.50
orated, per cwt.	6.99— 9.50	8.48
ensed skim, per cwt.	5.19— 7.25	5.96
orated skim, per cwt.	2.50— 6.45	3.70

September Dry Milk

m Report by U. S. Dept. of Agriculture) e wholesale prices given below are based eports from manufacturers governing ac- sales f. o. b. factory during September: y Skimmilk: Prices ranged from 7 cents cents for dry skimmilk in bulk, averag- .3 cents a pound for sales, totaling 7,170,- lbs. When packed in one-pound cans the reported was 33.5 cents a pound.

y Whole Milk: Prices ranged from 22 to 22.5 cents for dry whole milk, averag- 26.5 cents for sales totaling 375,528 lbs. n packed in one-pound cans the price re- d was 46.5 cents a pound.

y Buttermilk: Prices ranged from 7 cents .5 cents for dry buttermilk in bulk, aver- g 8 cents a pound for sales totaling 1,807,- lbs. When packed in one-pound cans the reported was 10.5 cents a pound.

'isconsin September Milk

e average Wisconsin farm milk price for ember, according to the report of the Department of Agriculture, was $2.14 hundred. This is ten cents higher than ust of this year, 25 cents above September st year, and 23 cents above September,

Iowa August Butter

e Iowa Creamery Secretaries' and Mana- Association reports that for the local meries reporting, patrons received 47.83 a pound for fat in August as compared 46.58 cents for the same month a year The price paid per pound of fat ranged 43 cents to 51 cents, with the average handled per creamery being 33,789 pounds.

Alfalfa Experience

OARD'S DAIRYMAN:—In 1923 I ght a farm with sandy soil in sago County, Minnesota. The fol- ing year I seeded about 6 acres lfalfa which did not seem to do t and some of the neighbors hed at me and thought I was ting my time and money in this ertaking.

n the summer of 1925 I seeded acres that gave a fair crop of lfa in 1926. This year's first cut- is about three tons to the acre a finer crop was never grown. It ld go five tons per acre for the ion.

applied two tons to the acre of stone and the results are shown. This year I had seeded ten acres to white sweet clover with the same treatment, and I am awaiting results.

The above, I believe, was the first alfalfa ever seeded in this section, and what it does here can be done anywhere. It is my intention to plant the whole farm to this crop in time, as I am convinced that the price of land will thereby be advanced, for alfalfa land is worth considerable more than land without it.

Minnesota. A. E. RINKER.

The Agglutination Test

The agglutination test for abortion was described as follows by Dr. J. G. Wills before a meeting of the New York Breeders' Association:

"It has been found that the blood serum of an animal affected with certain germ diseases contains a certain product which has the power, when added to other blood, of producing a clumping or grouping of the bacteria in such blood if of the same kind as in the test fluid. In the agglutination test for abortion the germ is grown in the laboratory mixed with a definite quantity of weak salt solution which is used in making the test. To this a definite fixed quantity of blood serum from the animal under examination is added. If the specimen under test contains the abortion germ, after this test tube stands over night we will find a grouping or clumping in the bottom of the tube. If the blood from the animal under test does not contain these germs the fluid will remain cloudy.

"A small amount of blood is necessary, not more than a tablespoonful or thereabout being needed. This is usually obtained by inserting a hypodermic needle into the jugular vein. It is necessary to restrain the animal by using a nose leader or having an attendant hold the animal, place a cord or small rope about the neck close to the shoulder, draw tight thereby stopping circulation in the jugular vein, which will stand out clearly—insert the needle with a quick jab through the skin and, if properly inserted, there will be an immediate flow of blood, which should be caught in a sterile bottle. This blood is allowed to clot and forwarded to the laboratory. Each bottle must be marked preferably with the ear tag number of the animal from which taken. It is necessary that great care be used in getting the proper identity of each sample taken, otherwise we may easily confuse the results.

"The technical training required to conduct this blood test is such that attempts to use it without laboratory facilities are, as yet, extremely unreliable. It should also be understood that while obtaining the blood sample may not, necessarily, require a veterinarian, it does require a person familiar with the exact technic to be followed and trained to observe certain sanitary precautions to avoid possible injury to the animal, as for example through infection from the needle, as well as to obtaining a proper blood sample.

"It is necessary that blood from all cows in the herd, as well as the herd bull, be taken, as well as heifers that have been bred and are carrying calves. There seems to be no necessity for taking blood from unbred heifers or from calves still nursing. The former are not often infected. Calves will respond, almost without exception, if the mother is diseased; this being due to certain products in the milk of the mother being carried into the blood of the calf and producing agglutinating power even though no abortion germs actually exist in the body of the calf."

Half Day's Work But No Groundhog

HOARD'S DAIRYMAN:—As I see it now, the hardest half day's work I ever did was trying to dig out a groundhog den. At the time, of course, it wasn't hard work—it was fun. I moved as much earth in that half day as a day laborer would in a week, I do believe. And I didn't get the groundhog. "You couldn't expect to," Ben Foster, an old timer in the neighborhood told me. "Don't you know a groundhog can dig faster than you can? He was keeping ahead of your spade."

Maybe so—I don't know whether Ben was right or wrong. One thing I do know, though, I can get rid of a groundhog now in less than a half day's time, and a whole lot easier than the digging method.

Calcium cyanide—that's the new method. All you have to do is put a tablespoonful of this material in the burrow, fill up the burrow, and the groundhog will never see his shadow.

This material, calcium cyanide, comes in crystals or powder. Some folks use the powder in a hand dusting machine—just stick the nozzle down the burrow, work the duster handle, then withdraw the nozzle and stop up the hole with a spadeful of earth.

The only thing to be careful about is breathing the fumes of calcium cyanide—it's dangerous.

Oh, yes, get after the woodchucks before June or July. The young chucks leave home along in the summer, and you may miss some of them if you wait too late in the summer.

Inexpensive, too; it costs only two cents to kill a groundhog with calcium cyanide. Costs more than that to dig them out, let me tell you.

New Jersey. E. A. KIRKPATRICK.

Holsteins to Japan

We are advised by Thomas J. Owens, president of the Washington State Holstein-Friesian Association, that a shipment of foundation Holstein cattle was made from Seattle October 19 on the S. S. London Maru for Japan. They were purchased for the Imperial Live Stock Experiment Station at Chiba, near Tokio, from the Carnation Farms. Included in this lot is the great cow, Bella Veeman Segis Matador, with a record as a four-year-old of 32,217 pounds milk containing 997.6 pounds fat.

Levi: Did you ever fall in love with words?

Solomon: Yes, with these, "enclosed find check."

WANTED!
A Livestock Man

—in each community to establish and supervise advanced feeding methods recommended by Agricultural Stations. Must know livestock; no other experience necessary. MEN WANTED ON RAILROADS
Nearest their homes—everywhere. Firemen, Brakemen, beginners $150—$250 monthly. Promoted to Conductor or Engineer—$3,000—$4,000 yearly—highest wages on railroads. RAILWAY ASSOCIATION, Desk M10, Brooklyn, N. Y.

End foot troubles forever!

Do you realize that your weariness, mental exhaustion, and many more serious ills are the direct result of foot neglect?
The everlasting service that you expect from your feet can only be realized if you give them the care which they deserve! Run-over heels are the danger signal, and should have immediate attention — if you want health.

Make Your Feet Happy!

THE National Bureau of Foot Correction has devoted many years specializing exclusively on the creation and development of foot aids that make feet happy
We offer you a foot aid that will positively adjust itself to your feet, and that will end the nerve-racking torment of aching feet.
National Foot Aids are constructed of finest leather with an aluminum heel-base, and with provision for adjustments at the arch, ball and heel.
You will rejoice in the comfort, correct support and youthful buoyancy—which you cannot possibly get in shoes alone! And it doesn't matter how many different pairs, or kinds of shoes you wear—National Foot Aids are adjustable and one pair of foot aids will fit all your shoes. And our special price, direct to you, is only $5.00 per pair.

Do NOT Send Money!

Just fill out the coupon at the bottom. Place stockinged-foot on a piece of paper, and trace outline of your foot, holding pencil upright. This is best accomplished while sitting down, to avoid too much pressure on the foot while tracing.
On receipt of the coupon and tracing, our experts will make up a pair of adjustable foot aids to fit your particular feet, and they will be mailed to you within 24 hours. On their arrival pay your postman only $5.00—as the carrying charges are paid by us! Send the coupon and tracing now, to—

Nat'l Bureau of Foot Correction
Paul Brown Bldg. Dept. D St. Louis, Mo.

How tracing should be made. If troubled with callouses, mark an X on the tracing where they appear.

Our Broad and Genuine GUARANTEE
We guarantee these foot aids to be exactly as represented. If after wearing them as directed, you do not believe that they give you genuine foot happiness —return them, and your money will be refunded promptly.

National Bureau of Foot Correction—Dept. D
Paul Brown Bldg., St. Louis, Mo.

Please send me, as per your guarantee, one pair of National Foot Aids, for which I will pay postman $5 on delivery. Enclose find tracing of my foot.

Banish the *Never-Ending Grind of* Hand Milking

YOUR grandfather had to milk his cows by hand. But you don't—any more than you have to drive to town with an ox team. Isn't it time to banish forever the drudgery of hand milking? Don't be the last to give up the old way. Join up with the thousands of farmers who now milk their herds easier, quicker, better and more safely with the Burrell Milker. The time you save can be used for other productive work, for leisure, and for pleasure—no other farm investment will give you such large returns.

Single Tube System

The Burrell also eliminates hand stripping—*It Milks the Cows Clean.* That's why you'll finally come to the Burrell.

D. H. BURRELL & CO. INC.
10 Albany Street, Little Falls, N.Y.

You Need This Book

Every cow owner needs it—whether he is now milking by hand or machine. It's not a mere catalog, but a 32-page profusely illustrated book which is a guide in both selecting and using a milking machine—backed by 67 years' experiment and experience. You owe this book to yourself. It's *free.* Send for it now.

Hunter of Kewaunee

(Continued from page 1039)

crop of wheat which he planted in the spring of 1841. A log cabin was erected where they resided for several years. My father, a lad of five, took kindly to outdoor life and would frequently accompany his father in search of game.

One fine spring morning while these two were out in the woods, they ran across a couple of cub bears. Strange to say they did not squeal as cubs usually will when molested, so they carried them home. One of the cubs was sold but the other one became tame and would accompany my father to the village or any other place. At the approach of winter, a hole was dug underneath the sill of the barn and a chain stapled to the sill. In this den the bear spent his first winter. He grew so rapidly that father had to discontinue taking him to the village as people were afraid of him, although he was perfectly harmless.

An interesting incident occurred in the fall. Two well-to-do Englishmen visited the United States for adventure and to kill bears for their skins. They expected to go West where bears were plentiful. Upon reaching New York they were told that what they needed was a bear dog.

The innocent Englishmen fell for this proposition and paid this fellow $500 for a dog which was untrained but whose bear killing instinct had come down through a long line of ancestry. They went from New York City to Buffalo and there got a boat that took them to Racine. While resting there for a few days they heard that Seth Moore had a large bear.

Early one afternoon, while my father was playing out in the yard, these two gentlemen came up leading a huge dog. It must have been a Great Dane. They immediately asked about the bear and were told that the bear was down near the barn. They asked if they could see my grandfather and my father readily ran to the house for him. They told my grandfather about their bear hunting expedition and the dog they had purchased.

Grandfather listened while they informed him that the dog wasn't trained and they felt before going into the forest in search of bears it would be a good plan to train him as to just how a bear smelled and acted. They said they would keep a rope on their dog and would only let him get close to the bear.

Grandfather, of course, was amused and told the men that as far as injuring the bear was concerned, they need not keep a rope on the dog. They seemed to be very solicitous about the bear being killed by the dog, but grandfather told them if they were willing to risk their dog that he would risk the bear, consequently they were delighted to take the rope off of the dog to leave him unhampered. Father claims that the dog was courageous and nearly as large as the bear. They found the bear amusing himself by circling in front of his den at the end of his chain.

On the approach of the strangers with the dog, he stopped his circling motion and sat up. When the men set the dog on the bear, the dog, desirous to obey, jumped at the bear. The bear wasn't used to such excitement but he stood his ground. Finally the dog, in one great leap, cleared the bear's head and grabbed him by the back of the neck. This bothered the bear and greatly aroused his anger. The bear broke the dog's hold by turning a somersault, then grabbed the dog with his paw and dashed for his hole. He went under like a flash and all that was heard were a few yelps from the dog.

The men immediately ripped up the barn floor, but found only a few mangled parts of the dog and the bear who resented their intrusion. The men expressed regret at the outcome. Grandfather told them it was a good lesson, that no one but a skilled hunter should attempt to go on a bear killing expedition and probably the loss of their dog meant the saving of their own lives.

The lands in the vicinity of Racine were very fertile. They were not so hard to clear west of town because of the prairie openings. The settlers came in rapidly. This was not so much to grandfather's liking because it interfered with hunting and trapping.

So grandfather took his family overland to visit his brother at Baraboo who had written him wonderful tales of that country. He rented his farms at Racine, put the family into wagons and started his westward trip. He went by way of Madison and camped on the shores of one of the beautiful lakes. He followed a tote road up to Baraboo and crossed the Wisconsin River with his horses and family on a ferry.

However, the country didn't look as wild as he had expected, so after visiting a day at Baraboo, he continued up the Baraboo River. He located about ten or twelve miles from Reedsburg and quite close to La Valle. He built a log cabin on the banks of Big Creek, a short distance from where it joins the Baraboo River, and purchased land from the government at $1.25 per acre. This seemed to be the most favorable country that he had yet reached from the hunting and trapping standpoint. He spent a great deal of his time hunting wild bees. He cleared off a few acres of land. He cut considerable bluejoint hay along the Baraboo River to feed his horses and one or two cows.

As fall approached, he devoted considerable of his time to hunting deer and trapping on the Baraboo Indians were plentiful but pe My father was then thirteen ye and hunted and trapped a grea with his father. His brothers take so much interest in huntir trapping.

There is one instance that relates that is quite interesting eral hundred Indians were cam the Baraboo River near their The Indians some time befor deeded their lands to the States Government, but many Indians didn't fully realize w meant to give the land away, that they had a just right of s there. They were notified s times by government officials to on their own lands in Minnesot refused to go.

Finally the government got s ox teams, loaded the Indians in wagons and carried them into M sota by way of La Crosse. T dians made no serious objecti though my father knew from t with the papooses that they want to go. The Whites retur the Wisconsin side of the rive started their long, tedious jo back. They were very much prised, however, when they re the old location of the Indian to find it inhabited again by the Indians. They wondered very how the Indians could have them back. They soon learned they had secured boats, gone do the mouth of the Wisconsin and paddled quickly back to the camping ground.

After a meeting at which the matter was discussed, they decid leave the Indians unmolested, they did, and the Indians lived happily for several years befor moved on of their own accord.

The early settlers, moving int County, cleared off the lands rapidly. This was not to my father's liking so he made one trips westward and hunted trapped in the vicinity of Neil and Black River Falls. Finally cided to return to his farm in Fo This he did early in the fifties found a big change in the county

He conceived the idea of see some big mackinaw boats with bows pretty well decked, and fall of the year took his hounds, and guns and sailed ward on Lake Michigan. This regularly for two or three fall ting up to a point where civiliz almost ceased to exist. One of h ceedingly good hunting points near the division line of Manit and Sheboygan Counties. My and one of his brothers, together a man or two who had worked grandfather, spent a goodly port the fall hunting and trapping

(To be continued)

Comparing Breeds

HOARD'S DAIRYMAN:—After reading your very interesting and instructive articles on the dairy breeds of the United States, I would like to set before your readers a few interesting figures regarding the number of completed records of the Holstein, Jersey, and Guernsey breeds in comparison with the total number of animals (including both males and females) registered in the herd books of each breed.

From data obtained from these articles and through breed papers I find that there have been registered to date about 1,500,000 Holsteins, approximately 700,000 Jerseys, and about 320,000 Guernseys. The average production for all cows tested of these breeds are: Holsteins, 15,720 lbs. milk testing 3.5% or 532 lbs. fat; Jerseys, 8,698 lbs. milk testing 5.4% or 466 lbs. fat; Guernseys, 9,664 lbs. milk testing 5% or 482 lbs. fat.

The point which I wish to carry is, when comparing breeds are these averages absolutely fair to each individual breed? I find that from these 1,500,000 Holsteins (males and females) we have 25,431 yearly tests, or about 1.69% of these cattle tested, while in our younger breed, the Guernsey, we have only some 320,000 registered, but with 22,165 tests or about 6.6% of this b total enrollment tested. The comes in on the happy medium approximately 700,000 registere with 19,742 yearly tests, or 2.85% tested.

Will not these wide variatio tween cattle tested, and total ment of each breed make it imp or unfair to one breed or anot attempt to compare the averag duction of these breeds?

Freeport, Pa. G. E

They call her compass becaus does have her good points.

krest Guernseys Average $632

e dispersion of the Barkrest nsey herd, owned by M. J. Bark-., Oct. 12, at Wooster, Ohio, was much of a success. Twenty-five als, guaranteed breeders and un-ished, went through the ring for '95, an average of $631.80. Six als sold for $1,000 or more each ne went to $2,050.

e high animal of the sale, Paul-f Shady Lawn Guernsey Farm, e Ohio state champion in Class and is in addition one of the ng cows in the state in Class A. was purchased by Edw. Orton, f Ohio.

E. Loker, Ohio, a newcomer g Guernsey men, purchased, g others, the 5-year-old son of Maid Queen of Spring Hill 1 lbs. fat in Class A) for $1,000. e sale was managed by the Ohio nsey Breeders' Association. Wal-ndrews did the selling and Sec-y Barlow was in the box.

llowing is a list of those animals g for $600 or more and buyers:

Firestone, Ohio	
rkrest Irene	$600
ugh, Ohio	
le's May Day	$600
Loker, Ohio	
auty of Shady Lawn	$1500

An Island Dairyman

ARD'S DAIRYMAN:—Not the d of Guernsey, but Guernseys on line Island, the largest island of postle Group located in Lake Su-r north of Ashland and east of eld. Madeline Island is about en miles long and three or four wide. It is inhabited principally en who give their time to com-al fishing, though there are a armers who devote most of their tion to dairying and fruit grow-

e writer called on one of the prominent dairymen on the l this summer and was greatly ed with what he saw. This dairy-Theodore Bissell, has about 200 , most of which are under culti-n and in grass. He keeps 18 to ernsey grade cows, and I might hat they are exceptional ones hat he is a good farmer and un-ands his business. Mr. Bissell n eighty-ton silo which is prob-the farthest north of any silo in nsin. When asked if he consid-the silo profitable, the owner l that it saved him some three or hundred dollars per year, and it paid for itself each year. This n, however, he remarked that orn is extremely backward and y be caught with a frost before ready for the silo.

is doing excellent work and ng a success of his dairy farming what I would call great handi-In visiting his farm I first in-ed his herd, which being in a did pasture close to the roadside only a few steps from the auto-e to the cows. They certainly above the average and all d thrifty and well kept. Mr. ll reported that he was selling $450 worth of milk and cream nth to the summer resorters. In winter and spring he produces n which has to be sent across the el to the creamery at Bayfield.

e growing period on these islands ort, and the cold water of Lake rior surrounding them acts as a gerator and prevents the hot weather experienced on the main land.

To illustrate how short the seasons are in this region: We found early Richmond cherries ripening August 15; the oats were still green and corn was about two feet high and would require from a month to six weeks to even make silage. In winter the water that must be crossed and the cold along with much snow which blocks transportation, makes it difficult to get to market. The islands are shut in during long periods when the ice is forming or breaking up. Sometimes the islanders cannot get to a store or trading place for several weeks owing to the dangerous condition of the ice which can neither be crossed by a sled nor boat. The springs are late and the summers short and cool. In spite of this or because of it, it is a wonderful grazing country. Splendid crops of hay can be grown, and clover of all kinds thrives and produces enormous crops. Fruit grows to perfection as well as vegetables which all seem to have a better flavor than can be obtained farther south. The summer and fall seasons are delightful, and the islands have a wonderful future as a resort country. They are especially adapted for sufferers of hay fever and asthma. Dairying and fruit growing are dependable and will in time make the islands rich centers of production.

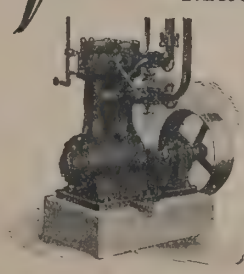
Nebraska. A. L. HAECKER.

Salesman: This is the type of press that pays for itself, sir.

Printer: Well, as soon as it has done that you can have it delivered at my shop.

Camel

The cigarette that leads by billions



Just to state a great truth in another way—Camel is so exactly what so many smokers want that no other brand is even a close second.

If all cigarettes were as good as Camel you wouldn't hear anything about special treatments to make cigarettes good for the throat. Nothing takes the place of choice tobaccos.

If Your Dealer Does Not Handle Goods Advertised in Hoard's Dairyman—Ask Him Why!

"Experience is a dear teacher"

From way out at Jay Em, Wyo., S. M. Foote writes: "I could have borrowed money at 10% interest and still be ahead if I had fenced when I started."

A $250 team of mares and five horses frozen to death in a blizzard—his only cow gorged to death in a cane field—a valuable Holstein bull altered by ranchers—jennets bred to a neighbor's scrub stallion—two Holstein heifers strayed away—200 chickens killed by coyotes—10 acres of cane mowed clean by range cattle—these are a few of Mr. Foote's losses before he fenced.

RED BRAND FENCE
"Galvannealed" Copper Bearing

will not only save losses like this for you but make enough extra profit to pay for itself, over and over again, in the many years of service it will give.

RED BRAND can't help but last for many years. Copper in the steel keeps long life in; extra heavy "Galvannealed" coating of zinc keeps rust out; picket-like stay wires, wavy line wires, can't-slip knots, help keep it straight, trim, hog-tight and bull-proof.

What has been your experience with or without good fence? We will pay $5 or more for each letter that we use. Write for details, catalog and 3 interesting booklets that tell how others have made more money with hog-tight fences.

Starts Hens Laying

Here's a New Way to Get Eggs in Winter. Costs Nothing to Try

A letter from Miss Dama Wright, Vernonia, Ore., has a real idea for chicken raisers who are not getting plenty of eggs. She says:

"Late in October, our fifteen hens were not laying at all. I started giving them Don Sung, and for ten days they still didn't lay. But on the eleventh day they laid thirteen eggs, and it is wonderful what Don Sung has done for our egg basket."

Don Sung, the Chinese egg laying tablets which Miss Wright used, are opening the eyes of chicken raisers all over America. The tablets can be obtained from the Burrell-Dugger Co., 316 Postal Station Bldg., Indianapolis, Ind. Poultry raisers whose hens are not laying well should send 50 cents for a trial package (or $1 for the extra large size, holding three times as much). Don Sung is positively guaranteed to do the work or money promptly refunded, so it costs nothing to try. Right now is the time to start giving Don Sung to your hens, so you will have a good supply of fresh eggs all winter.

SPROUTED OATS

FARROW CHIX FOR SUCCESS

First Chix Will Be Ready in February, 1928
D. T. FARROW CHICKERIES, PEORIA, ILL.

Poultry

Choosing a Breed

We want to buy some chicks this fall, that is, some of the lighter kinds. What kind would be best to get, the Leghorns, the Minorcas, or the Andalusians? Will the lighter kind mature quicker than the heavy kind?

What should we feed them and what should we give them to drink in the beginning?

Please tell me what the Wisconsin ration contains.

When you say feed chicks 48 or 72 hours old, does that mean that they should not have anything to drink until they are that old?

Ackley, Ia. M. V.

Every time a person starts talking breeds, regardless of whether that may be in poultry, dairy cattle, hogs, or anything else of that kind, it is an absolutely positive indication that an argument is going to result. I find that a person is just about as safe in criticizing a man's selection of a breed as he is in criticizing his selection of a wife, since in either instance they are sold on either one of them for life.

In most instances, though under average conditions which is the controlling factor, we find there are more high records made and more high record stock available in Single Comb White Leghorns than there are in any other one of the breeds or varieties that we know of. Some people will take the Minorcas because they are a little bit larger and produce larger eggs, but under the present market conditions we do not get any premium outside of the production of a 24- to 26-ounce egg. When it comes to producing 26- to 28-ounce eggs about the only added benefit we get from it comes from that pride of production of something superior.

One of the disadvantages of the Andalusians, of course, is that the Blue Andalusians do not breed true. Each year from the mating of blue males and blue females one will obtain a certain percentage of blue birds but another percentage will be black and another percentage will be white or white mottled with black. This will occur each year and there is no way possible by which a Blue Andalusian can be produced that will not produce in turn both blue, black, and white offspring. That is a point not always understood on the part of a purchaser and they are sometimes disappointed in the progeny that they may obtain from the Blue Andalusian. They sometimes think it is a result of mixed breeding but that is the result of the means by which they have been produced and will always continue.

The so-called Wisconsin Ration is made up of 80 lbs. of ground yellow corn, 20 lbs. standard wheat middlings, 5 lbs. of raw bone chick size or special steamed bone, 5 lbs. of a high calcium carbonate grit, 1 lb. of salt, with milk for the chicks to drink.

In most instances when it says not to feed the chicks for 48 to 72 hours it means that the chicks should not eat anything during that time providing they are not allowed under the brooder.

You have undoubtedly noticed in some of the earlier discussions in this column that we do not advise chicks to be placed under the brooder until time to feed them, which means they are kept either in the chick boxes or in the brooder, preferably in the chick boxes until they are 48 hours old, and then at that time are placed under the brooder and are fed and given the milk to drink at that period. Oftentimes the mistake is made in that a great many people will put some sand or gravel on the floor of the colony house under the brooder, put the chicks in there and then wonder why they lose chicks as a result of their becoming filled up with this sand or gravel and a heavy mortality resulting. A chicken is going to eat most anything it has there if the feed is not supplied. Overcome it by not putting them under the brooder until ready to feed them.

For the first three, six, eight, or ten, or possibly twelve weeks the chicks would have nothing to drink except milk and no water supplied to them during that time which is the one source of animal protein feed which is possible for them to obtain.

The advantage of sunlight has been discussed previously and whether or not cod liver oil should be supplied as a part of the ration is based entirely upon your conditions. If you have sunlight available for them, the cod liver oil should not be supplied, otherwise about 2 per cent should be added to the mash mixture. —J. B. HAYES.

Estimates of the cost of brooding and rearing Barred Rock and White Leghorn chicks indicated that the feed costs were similar for both breeds, but since the Barred Rocks made more rapid gains the cost per unit of gain was less.—Report of Canada Experiment Farms.

The codfish lays a million eggs,
And the helpful hen lays one,
But the codfish doesn't cackle,
To tell us what she's done;
And so we scorn the codfish coy,
And the helpful hen we prize,
Which indicates to you and me,
That it pays to advertise.

—Grit.

Only $38.75 for Latest HAMMER TYPE FEED MILL

Run by 2 H.P. Electric Motor or 2½ H.P. Gasoline Engine. Grinds 35 bushel shelled corn per hour. Runs slow — grinds fast. No burrs to replace. Nails, bolts and wire can't damage it. Screens changed without stopping mill.

PRATER MILL

Does best grinding, is lowest in first cost and operating cost — is durable and simple. Endorsed by Electric Power Companies. Can be started fully loaded without causing line disturbance.

Made in Three Sizes
Capacities 35 to 85 bushel shelled corn per hour

2 H.P., price $38.75; 3 H.P., price $44.25; 5 H.P., price $65. Can be furnished equipped with Fan Blower and pipe for elevating feed up to 40 ft. Also complete with Electric Motor, mounted as unit with Mill.

Swine

ning or Two About Hog Houses

is a time of year when hog come into their greatest use- s. We may differ on the size and of hog houses but we can be of pinion on the desirability of ating or avoiding slippery floors with large cracks or in them, low doors, narrow high door sills, heavy banging poor ventilation, and such like. m agree that a pig can stand erable cold weather if it has leeping quarters. Comfortable rs, therefore, are largely a of a tight roof, a well drained and proper circulation of air, tilation.

Cull Cows, Why Not Sows?

hin the next two months thou- of sows and gilts will be bred e 1928 spring pig litters. It is tant at this time to consider the iness of each sow or gilt to be ued or started in the breeding

orous culling of unfit breeding ls is one of the fundamental s of success in live stock im- ment and applies to swine in the degree as to other classes of animals.

e tends to beget like. If our are consistently selected from litters of strong pigs the ten- for them to reproduce in like ers and kind may be expected. ends to beget like. If our tried are poor milkers, have a small er of teats, and do not know o mother their pigs, they have oved their worthiness to be con- in the breeding herd. If our and gilts are not from litters o well, provided they have been rly fed, their places could well en by the kind that will give the t of doubt for doing well to pigs.

sinfecting Hog Houses

ore winter sets on in earnest we to advance a word or two about ecting the winter quarters for . The particular thing we want e on swine producers is that the e done thoroughly.

purpose of disinfecting is to ll disease germs or as many as le. To do this the disinfecting on used must reach all parts of terior of the building.

at otherwise might have been a gh job of disinfecting frequent- s because the wall and floor sur- have not previously been d and exposed so that the dis- ing solution can reach them. b of disinfecting can be proper- e until the surfaces to be treat- ave been thoroughly cleaned. vater in which lye has been dis- l, one pound to 30 gallons, s a very good cleaning solution. A stiff broom and a brush or two oiled with elbow grease complete the necessary cleaning equipment.

Balanced Rations are Most Efficient

At this time we are concerned with good rations for fall pigs. By good rations we mean those that will produce 100 lbs. gain with the least requirement for feed and at the same time afford health protection to a degree consistent with satisfactory gains.

Perhaps the greatest fault in winter rations for fall pigs is the frequent lack of the proper balance of nutrients brought about chiefly by the use of too great a proportion of cereal grains or by the complete lack of high quality protein supplemental feeds.

Feeding pigs nothing but cereal grains and their by-products is an expensive way to make pork and the higher the prices for feeds the more expensive it becomes.

Prices for supplemental feeds look high and we decide to feed corn, oats, or barley or combinations of these with, perhaps, wheat middlings. The price of the supplemental feed is not nearly so important as the money value of the amount of grain a given unit of such feeds will replace. For example, in an Iowa Station experiment two lots of 9 pigs each averaging about 135 lbs. per pig at the beginning of the trial were fed; one lot on corn meal, the other on corn meal 10 parts to 1 part tankage. The lot fed corn meal required 556.6 lbs. for 100 lbs. gain; the other lot required 409.9 lbs. corn meal and 40.9 lbs. of tankage. Thus the 40.9 lbs. of tankage replaced 146.7 lbs. of corn meal. If we value the corn meal at 2 cents a pound the tankage was worth $140 a ton. Furthermore, the pigs fed a simple balanced ration reached the handy market weight of 225 lbs. 29 days sooner than those fed the unbalanced ration of corn meal.

It is not a difficult task to properly supplement cereal grains. If skimmilk is available the feeding of 3 lbs. of it to each pound of grain fed will balance the ration. If skimmilk is not available tankage is very good and should be fed in the proportion of 1 of tankage to 10 of grain. The grain requirement could be further reduced and the rate of gain increased by feeding both skimmilk and tankage or by feeding a mixture of tankage 60 parts, linseed meal 20 parts, and middlings 20 parts.

Well balanced rations need less attention to the vitamin supply than those not so well balanced with respect to nutrients. This does not mean to say, however, that beneficial results will not be secured from supplying this growth stimulating factor. A very simple and effective way to supply the vitamins most likely to be deficient in winter rations is to feed alfalfa or clover hay in racks where the pigs may help themselves. If alfalfa meal is fed it is best to mix it with the supplemental mixture.

B-K is Wonderful
for removing Retained Afterbirth

Peter Shallow, owner of a beautiful herd of Guernsey cattle, says: "I find B-K the greatest thing out for cows that do not clean readily after calving. This is a job I always had to do by hand, but now I use B-K by injecting about a gallon of water and B-K solution at the rate of 1 oz. to 6 quarts of water, and have never known it to fail in bringing all things right before the fourth day."

Calf Scours

"Had 33 calves with scours too weak to stand. With B-K I saved them all." — W. McClary, Muscoda, Wis.

"I especially value B-K for 'white scours' among calves. We have 40 calves under 6 mos. of age and have not lost one since I got B-K." — Mrs. Julia Stevenson, San Antonio, Texas.

On thousands of Farms B-K is kept on hand constantly to prevent and control **retained afterbirth, abortion, calf scours, dairy sterilizing, disinfection** for **poultry** and similar uses. It is non-poisonous, clean, and leaves no odor. Dependable and cheap.

Abortion

Write for valuable book about the use of B-K for live stock. The information it gives has saved farmers many thousands of dollars. Address General Laboratories Dept. 101L Madison, Wis.

A chapter of our valuable free book is devoted to abortion—the germs that cause it—how they are spread—what can be done to avoid losses from this insidious disease.

Disposal of Carcasses

Some years ago, on a blazing hot July day, as we were driving past a small, sandy lot near a farm house an explosion occurred. We saw the sand fly up and then the gas almost overwhelmed us. That was many years before the introduction of mustard gas, tear gas, and poison gas bombs. Had a dozen skunks suddenly gone into action the result would not have been more powerful. A shallow-buried horse had exploded!

Often, too, we have seen the legs of a buried animal sticking out of the grave and sometimes dogs have been tearing at them and other exposed parts of the carcass. It is also a comparatively common thing to see a carcass lying unburied in an old sand pit or on some back lot on the farm, or partly submerged in a river, creek, or pond. To these carcasses go dogs, wolves, coyotes, foxes, buzzards, and crows. By their means germs of malignant diseases are spread in a countryside. To such a source may be traced many an outbreak of anthrax and hog cholera. In Indiana it was found that the latter disease occurred in exact ratio to the distance of the herd from a certain river. The supposition is that the river was made the dumping ground for hogs dead of cholera, and so the infection was spread by the water. In other instances a stream has been found the distributor of tuberculosis, contagious abortion, dysentery, and contagious foot and mouth disease. In North ern Iowa we remember of anthrax that killed a number of cattle being traced to the carcass of an animal that had died in a surface water pond, or been thrown there by the owner. In another instance, anthrax that killed several fine cattle grazing on a low ground pasture was traced to a grave on a distant gravel knoll, in which two anthrax carcasses had been buried. A stream may also carry infection from a tannery or slaughter house. Earthworms have even been blamed for bringing to the surface, on pasture, anthrax germs from graves. A carcass not entirely destroyed by burning or by very deep burial in quick lime remains a source of infection and is therefore to be considered a serious menace.

The fact that it is not a very easy matter to burn the carcass of a large animal and that digging a deep grave for such an animal is a "big chore" accounts for the incomplete burning and shallow burial of carcasses. Once, in Illinois, anthrax killed a large number of cows and when we visited the district, to make an investigation, we saw half and quarter burned carcasses lying about in several fields near the public highway. Around each carcass was some partly burned straw and brush. No wonder the attempt to consume the carcasses failed!

The right way to burn a carcass is to dig two 7-foot long trenches at right angles to each other, thus forming a cross. The trenches should be 15 inches wide, 18 inches deep at the center, and slanting up to the outer ends so that they will allow admission of air from each quarter of the compass. The earth from the trenches is thrown into the angles and across the heaps are placed two or three old railroad rails, or an iron wheel to serve as a grate. On the grate dry wood is piled, the carcass on top, then more fuel and finally the legs and entrails, if the animal has been opened. It is best not to open an anthrax carcass. Finally the fuel and carcass are saturated with kerosene and a light applied. By such means a large carcass may be completely consumed in five or six hours. If deep burial is deemed preferable, cover the carcass with several bushels of quick lime. Graves in which anthrax carcasses have been buried should be so fenced that they cannot be grazed over by cattle or other farm animals.

Rickets

Please let me know what is the matter with pigs, about half grown, that are weak behind, sometimes hardly able to get on their feet. They eat good but are at all times very gaunt. They stagger around like drunk. One pig was sick for about three weeks and now most of them have it. They have been sick for two weeks; have not lost any but one or two show signs of dying.

Shell Lake, Wis. M. E. A.

Isolate sick pigs. Burn carcasses or bury them deeply in quick lime. Cleanse, disinfect, and whitewash the hog house, including the floors. Move the pigs that are not sick into new quarters on grass and let them gorge green crops, preferably clover and alfalfa. Treat them for worms by giving santonin in sloppy food in the

SOFT BUNCH OR BRUISE

on ankle, hock, stifle, knee, or throat is cleaned off promptly by Absorbine without laying up horse. No blister; no pain; no hair gone. At druggists, or $2.50 postpaid. Describe your case for special instructions. Valuable horse book 8-S free.

A satisfied user says: "Colt's knee swollen four to five times normal size. Broke and ran for two weeks. Now almost well. Absorbine is sure great."

HOW To Get Full Value from Every Ounce of FEED

Valuable feed is being wasted, herd vitality lowered, growth stunted and profits ruined today because of neglect in supplying the vital elements of vigor and rapid growth found in MURPHY'S MINERALS. I repeat it, you ***must*** supplement the mineral-exhausted feeds of today as you would fertilize the mineral-exhausted soil in the field. I guarantee to help you to greater herd profits with my proven mineral feed.

MURPHY'S MINERALS SAVE FEED

Send 10c for Prof. Evvard's Book on MINERALS and FEEDING

My nation-wide farm trade tells me in thousands of letters that MURPHY'S MINERALS save as much as 17 times their cost in ***other*** feeds, revitalizing herds and flocks, building disease resistance, increasing milk receipts, speeding up growth, saving in some cases as much as two months in pushing a bunch of hogs from pighood to the market. Interesting details upon request. Write TODAY enclosing 10c to pay postage on Prof. John M. Evvard's wonderful book, a course of instruction in stock feeding told in simple words. It is worth many times the cost. Address

James H. Murphy, Pres. Murphy Products Company, Dept. 400 Burlington, Wisconsin

James H. Murphy, President, Murphy Products Company, Dept. 400 Burlington, Wisconsin

Kindly send me free of charge all information regarding MURPHY'S MINERALS. Also find 10c enclosed for Prof. Evvard's book.

BROWN SWISS

Brown Swiss Bulls Mark Imprint on Grade Herds

Extra large production in a herd of grade cows may be gained by breeding with a Brown Swiss bull. They sire strong calves of a uniform type, well adapted for the general dairy farm. Mature bulls weigh between 1,800 and 2,500 lbs.

We will be glad to help you secure a Brown Swiss bull and, if you desire, a heifer or a cow.

Purebred Ayrshire Cattle For Sale

Herd headed by a full brother to our two-year-old State Champion heifer, 13,280 lbs. milk, 475 lbs. fat in a year. Dam has 8 A. R. daughters.

WM. NISBET & SONS, Richland Center, Wis.

AYRSHIRES for Steady Production

It's that steady production everywhere, under all conditions that is making the Ayrshire the most popular dairy breed. Ayrshire breeders have long known that profits come from cattle that keep everlastingly producing milk that tests four per cent. Herd records prove that these breeders have developed cattle that lead in high average production.

Ayrshires are built for service. Their rugged bodies and perfect udders wear like iron and keep them working to a ripe old age.

Your profits may be increased by the use of an Ayrshire bull, or the selection of a few females.

Jersey Bull Calves

We are offering at reasonable prices a few bull calves sired by Vive La France's Darling Son and out of cows of rich Sophie's Tormentor breeding. Vive La France's Darling Son is out of Vive La France, the first cow to make over 1000 lbs. fat and the cow whose average of 890 lbs. butterfat for first 6 lactation periods exceeds that of any other dairy cow. He is sired by Darling's Gallant Boy, the silver medal sire and full brother to Darling Jolly Lassie, 1141 lbs. fat as Jr. four-year-old. Two of these bull calves are out of granddaughters of Sophie's Agnes, the first Jersey cow to make 1000 lbs. butterfat.

THE GOLDEN GLOW JERSEY FARM KENSINGTON, MD.

You Would Not Think of Working a Sick Horse, But—

HOARD'S DAIRYMAN:—"How is your soil this year?" I asked a farmer a few days ago.

"Sick as a horse!" he replied, looking out over a field that was about ready for harvest.

It is my business to learn about soils and I went ahead and examined the soil of the field in question. His answer was right. That soil was sick as a horse—a whole lot sicker than any horse the farmer would be willing to work.

That soil had indigestion, bad respiration, faulty circulation, dropsy, halitosis, and it was lousy into the bargain. The straw and manure that had been plowed under the year before still lay in the ground, unchanged and undigested. There was no granulation or tilth to speak of and the only chance air had to get into the compact mass was through a crack here and there in the soil. The soil particles did not cling together in granules but slumped together in a general compact mass that had no power to raise water toward the surface. The same arrangement of the soil particles made the soil ready to be waterlogged by the next winter's rain. A freshly broken clod of it gave off a smell, half sour and half fetid; not at all the smell that a live, well aerated soil should have. And the field was full of weeds that had outgrown the crop—lousy with weeds!

That was an extreme case. It will take a long time and a lot of medicine to bring that soil back to health. It would have been a lot easier to cure that soil a few years ago and still easier to have begun preventive treatment before it became sick at all. The work the soil would have done as a healthy soil would have paid the cost of treatment many times over.

There are a lot of fields in Northwest Washington that are sick with this same sort of sickness and many more that are just coming down with it. You can tell them because they begin early to lose their power of production. All of our soils that "aren't doing as well as they used to" are affected. You may give them a stimulant—lay the whip to the sick horse—and get a few more season's work out of them, but if you do this instead of curing the sickness you lose in two ways; you cannot get a full season's work out of the sick soil and the sickness will grow worse all the faster.

If your soil is losing a bit of its power of production; if it is unable to fully digest manures and give you full returns on its feed; if its breath is bad; if it is losing tilth; if crops dry out with water in the subsoil; if it waterlogs and drains too slowly; or if weeds crowd more and more upon the crop, it is time to call the doctor. Or, if your soil is still in good health and produces a full crop without a whip, learn from the experience of others and begin preventive treatment before this inevitable sickness of hardworking and ageing soils begins.

This sickness of soils is called "soil acidity." It is prevented and cured by a single known remedy—limestone. All forms of lime quickly become the same as limestone in the soil so that it is always limestone that works the cure.

Soils that are still unaffected will continue to work forever in good health if you feed them properly and lime them occasionally. The soils that are not too far gone may be worked while they are being cured if you feed them well. But the soils that are in bad shape should be dosed heavily and turned into pasture for a few years and then, unless you deny them their condition powders and invite the return of disaster, they will again be able to serve you well and continue, so long as you feed them well and treat them kindly, to the end of time.

Washington. H. M. EAKIN.

Indiana Dairy Course

The Dairy Department at Purdue University will offer an eight weeks' dairy course, beginning January 16 and closing March 12, 1928. This course will take up the feeding, breeding, and management of dairy cattle; also the testing and marketing of dairy products.

For further information regarding this course, write Professor H. W. Gregory, head of the Dairy Department, Purdue University, W. Lafayette, Indiana.

New American Jersey Cattle Club Director

J. W. Ridgeway of Fort Worth, Texas, has recently been elected a director of the American Jersey Cattle Club to complete the unexpired term of the late J. Riley Green. Mr. Ridgeway, formerly head of the dairy department of the Texas A. & M. College, is now with the Mistletoe Creameries, owners of a large Jersey herd.

From toil he wins his spirits light,
From busy day the peaceful night;
Rich, from the very want of wealth,
In heaven's best treasures, peace and health.
—GRAY.

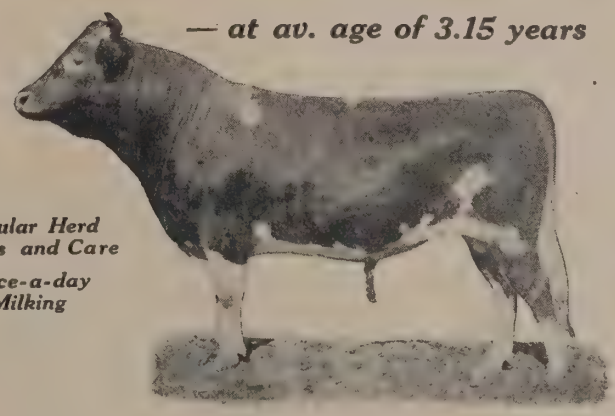
Guernsey Bulls at Farmers' Prices

Six months old show type, sired by the best son of the Famous World's Record Cow, Lone Pine Mollie Cowan A. R. No. 11278, who sold for $15,100 at Stout Dispersal Auction. Dams have A. R. records.



HAPPY HOLLOW FARM, A. M. Kailing, Prop., THIENSVILLE, WIS.

His First 20 A. R. Daughters average—434.7 lbs. fat 8989.11 lbs. milk

— at av. age of 3.15 years

— Regular Herd Rations and Care

— Twice-a-day Milking

ANTON'S KING CONFIDENCE—43517 A. R.
Photo taken when two years of age.

SIRE—Anton's May King, sold for $7000.00. DAM—Ma Chere Confidence who has a two year old record of 511.82 lbs. butterfat and a junior four year old record of 764 lbs. butterfat. Ma Chere Confidence is one of the outstanding daughters of the famous Jardinier's Masher. A. K. C. sires excellent udders, long deep bodies, straight top lines, and real production.

You can buy bull calves out of his daughters and sired by outstanding bulls, from us very reasonably. Do not write us if you want a serviceable bull. Our males are always sold before they are old enough for service. Buy a young calf, raise it yourself, and save money. We have several nice ones on hand now — and they are priced to sell.

HERD ACCREDITED

Hoard's Dairyman Farm, Fort Atkinson, Wis.

National Dairy Show Down in Dixie

(Continued from page 1069)

looking cow that should carry quite a good udder when fresh.

Holger Larsen's Long Hollow Mercedes Butter Boy, a dry 4-year-old that has been a consistent winner all season, won again and was senior and grand champion as well, beating not only the aged cow but also Miss Lassie Ormsby, C. E. Griffith's 3-year-old, and a good 2-year-old owned by Paul Stewart of Iowa.

The Jefferson County Asylum won both yearling heifer classes with daughters of Dutchland Creamelle Denver Prince and one of Carnation's daughters of Sir Inka May headed the calves. The junior yearling was junior champion.

The get of Forum Patriarch that has been winning all fall was first again at Memphis. It includes a junior yearling bull, two good two-year-old heifers, and a junior yearling.

Four state herds were out, Wisconsin, Illinois, Iowa, and Michigan, placing in the order named.

The awards follow:

Bull 4 years or over—1 and 5, Elmwood on Sir Fobes Ormsby Hengerveld and De Kol Pabst Korndyke Star; 2, Carnation on Prince Cornucopia Tobe Pontiac; 3, Stewart on Tritomia Ormsby Pietertje; 4, Forum on Forum Patriarch. Bull 3 years, under 4—1, Femco on Blue Earth Duke Ormsby; 2, Griffith on Canary Paul Anna Homestead; 3, Rudolph on Tower Hill King; 4, Jones on Count Paul Calamity Veeman; 5, Fredmar on Fredmar Korndyke Lad. Bull 2 years, under 3—1, McDonald on King Homestead Piebe Lad; 2, Carnation on Prince Tobe Johanna Beets; 3, Buhl on Admiral Traverse Pride; 4, Chapman on Triune Ormsby Piebe 59th; 5, Logan on Butter Boy Prince Ormsby.

Cow 5 years or over—1, Mich. Ref. on Tulip Beauty; 2, Carnation on Noonsack Irma Segis; 3, Jefferson Co. Asy. on Clothilde Wayne Denver; 4, Logan on Lily Segis Cornucopia; 5. Buhl on Bess Ormsby Korndyke Jewel. Cow 4 years, under 5—1, Forum on Long Hollow Mercedes Butter Boy; 2, Stewart on Miss Pontiac Pietertje Ormsby; 3, Carnation on Walcowis Mooie Creamelle; 4, Elmwood on Oakwood Piebe Allie; 5, Griffith on Aaggie Buckeye Beauty 2nd. Cow 3 years, under 4—1, Griffith on Miss Lassie Ormsby; 2, Jefferson Co. Asy. on Johanna Pietertje Artis Creamelle; 3 and 5, Carnation on Canary Posch Dewdrop and Hazelwood Segis Pauline Heilo; 4 Chapman on Winnemaug Pauline Korndyke. Heifer 2 years, under 3—1, Stewart on Lucy Sweet Buttermaid; 2, Jeff. Co. Asy. on Inka Creamelle Colantha; 3, Carnation on Carnation Segis Inka; 4, Forum on Forum Patricia; 5, Wis. State Board of Control on Sedgland K. B. Madam Homestead.

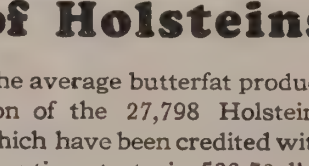
Get of Sire—1 and 5, Forum on Forum Patriarch; 2, Carnation on Sir Inka May; 3, Stewart on Tritomia Pietertje Ormsby; 4, Jeff. Co. Asy. on Dutchland Creamelle Denver Prince. Produce of Cow—1, Carnation on Pet Hengerveld Cornucopia; 2, Christ & Braman on Star Johanna Pietertje; 3, Stewart on Daisy Calano Clothilde; 4 and 5, Forum on Drosky Madison Jennie and Forum Johanna Skylark. Young Herd—1, Carnation; 2, Jeff. Co. Asy.; 3 and 5, Forum; 4, Elmwood. Dairy Herd—1, Forum; 2, Carnation; 3, Elmwood; 4, Stewart; 5, Uni. of Ill. Proven Sire Class—1, Stewart on Tritomia Pietertje Ormsby. State Herd—1, Wisconsin; 2, Illinois; 3, Iowa; 4, Michigan.

Senior and grand champion bull—Sir Fobes Ormsby Hengerveld. Junior champion bull—DeCreamCo Calamity Posch.

Senior and grand champion cow—Long Hollow Mercedes Butter Boy. Junior champion cow—Inka Wayne Creamelle.

Feeding Experiments

The results of three feeding experiments with dairy cattle conducted by W. B. Nevens at the Illinois Station and published in Illinois Station Report are briefly reported:



Thickly planted soy beans make best quality hay.—Hay from soy beans planted thickly was found to have less coarse stems, and smaller amounts of hay were refused than when the soy beans were not so thickly planted.

Legume hays fill lime needs of dairy cows.—Mineral supplements to rations including legume hays at the rate of 3 to 4 per cent of the concentrate mixture were found to be too laxative, and 1 to 2 per cent of mineral supplements appeared to be adequate. Mineral supplements to rations containing timothy hay and corn silage were ineffective in preventing a more rapid decline in milk production than occurred when alfalfa hay was fed. There appears to be no craving for lime by dairy cattle when receiving rations of legume hays and corn silage as roughage.

Silages from immature corn had low feeding value.—The large southern varieties of late maturing corn, containing about 22 per cent of dry matter, produced silage of good keeping qualities but of low feeding value and palatability. An early maturing, prolific type of corn gave as large yields in dry matter as the southern varieties. Acid determinations showed small differences in the silage from early and late maturing types, though an immature southern corn produced silage of very low palatability for sheep. This silage had a sharp and slightly bitter taste.

HOLSTEINS

Holstein Milk

Vitality!

The Production of Holsteins

The average butterfat production of the 27,798 Holsteins which have been credited with long-time tests is 533.72 lbs. for the average 331 producing days. For the 9,774 aged cows — average producing days 332 — the average butterfat production is 600.60.

U. S. NATIONAL SALE — Nov. 17-18

Watertown, Wisconsin

A SON OF SIR INKA MAY

Ready for service. From a 35-pound, 900-pound cow

SIR INKA MAY 11th

BORN AUGUST 19, 1926

His dam has made 35.83 pounds of butter in 7 days. Before that she ma 33.18 pounds of butter in 7 days—and 905.12 pounds of butter in a year.

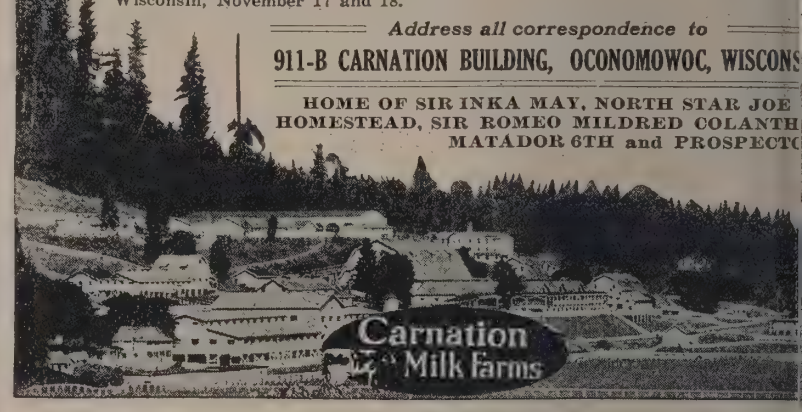
Her other son sold at the National Sale a few years ago for $1500.00 at months of age. She has 3 splendid producing daughters.

Her dam is a 28-pound daughter of Sir Skylark Ormsby Hengerveld.

Her sire is from our grand old breeding cow, Inka Princess Mutual De K —a 33-pound cow with a 30-pound, 1000-pound daughter.

Remember These Facts! —

You will meet breeders without going far who have seen and admired a tried to purchase this bull, but we have held him in order to offer a ready s service Inka May bull at this sale.



Just a year ago at the same sale in the same place at least 12 men we disappointed in not securing the Inka May bull we offered there. Since th every breeder has had a glimpse of the future of Sir Inka May by observi how the young sisters of this bull sold at the Minnesota Holstein Co. and Hol hock Sales. You know what his offspring are doing in the show ring.

The surest way and the quickest way to tie up your herd with Sir Inka M is to purchase Sir Inka May 11th at the U. S. National Sale at Watertow Wisconsin, November 17 and 18.

Eleven Nearest Dams Will Average Over 1000 Lbs. Butter in 365 Days

WE OFFER A ROYALLY BRED BULL CALF BORN SEPT. 23, 1926

Sire, SIR WALKER SEGIS HOMESTEAD, a proven show bull, sire of 45 A. R. O. daughters. He is a "PIEBE" son from a 1230-lb. former world's record "COUNT" daughter.

Dam, LASHBROOK JUNE WALKER ORMSBY, an extra good two-year-old heifer now on yearly test and producing from 750 to 800 lbs. butter this year. Her dam a 1040-lb. cow and sire's dam a 1265-lb. daughter of Sir P. O. M. This bull will put type and production in your herd and is high class in every respect.

Send for Pedigree and Photo

Kow-Kare Conditions Cows for Freshening

It is well-known that most cow disorders have their origin in breeding troubles. The terrific strain of producing a healthy calf and coming through the freshening period calls for more than good food and comfortable quarters.

Let Kow-Kare be your aid when cows freshen. No investment is so certain to pay big returns. Instead of *expecting* trouble, you *prevent* it,—effectually and at slight cost. Kow-Kare invigorates the genital organs—makes them function as nature intended. Feed Kow-Kare two or three weeks before and after calving—a tablespoonful with the feed, and say good-bye to worries with freshening cows.

Treating Cow Disorders

For all cow ailments arising from weak digestive and genital organs—Barrenness, Retained Afterbirth, Abortion, Bunches, Scours, Lost Appetite, etc., Kow-Kare is a reliable home remedy. Full directions on each can.

For Healthy Udders

—use BAG BALM, the wonderful healing ointment. A great healer of the delicate tissues of udder and teats. Big 10-ounce can of this famous healer, only 60c.

Home-Mix Your Own Complete Mineral

With Kow-Kare you can easily mix your own complete mineral at a surprisingly low cost—a mixture of marvelous conditioning value. Simply mix 30 lbs. salt, 30 lbs. fine-ground lime, 30 lbs. steamed bone meal and four cans (large) Kow-Kare. For well under $6 per hundred you will have an unbeatable mineral. Use 80 lbs. of this mixture to a ton of grain.

Saves money—gets more milk from low-cost feeds

COWS on winter feed need a different type of care and handling than cows in pasture. Succulent, green feeds are turned into milk with a minimum strain and effort of the milk-making and digestive functions. The outdoor life induces health and vigor.

Barn-feeding conditions are a different story. The diet is heavier, richer, harder to digest. Fresh air and exercise are largely lacking—But the milk-yield must keep up. A slump means profits wiped out. The cow must be *forced* or the milk check disappoints.

Secret of Heavy Winter Yields

During the long winter months—when your cows are subjected to this unnatural strain of modern dairying—you can gear up the whole herd to new heights of production by the simple addition of small quantities of Kow-Kare to their low-cost feeds. This great product is a concentrated *regulator* of the digestion and assimilation of milk cows. It replaces the wear and tear on the over-worked organs of production.

Kow-Kare makes a reasonable forcing process safe and effective—helps the cow to get all the milk value from Nature's foods with safety to her health and vigor. No need to pay out all your income for rich and expensive concentrates which, at best, have only temporary effect on production.

Give Kow-Kare a real test this winter on the whole herd. For a few cents a month per cow you will reap a surprising milk crop from natural low-priced feeds. A tablespoonful of Kow-Kare with the feed one to two weeks in each month is all the average b needs. The benefits show in the milk pai inevitably. Health, vigor and freedom f disorders is your *bonus* for adopting Kow-Kare feeding practice that is standard in thousands of money-ma dairies.

Thirty Years of Success

For over thirty years Kow-Kare has been hel dairymen to make more money from their he both as an aid to greater yield, and in the pre tion and cure of cow disorders. Get your su from your feed dealer, general store or drug Large size $1.25; six cans for $6.25. Small 65c. If your dealer is not supplied, we will direct, postpaid.

You Need *Never* Change Your O
if You Own a Buick

Last year Buick said: "Change your oil only four times a year."

Buick tests at the great Proving Ground of General Motors at that time had shown that oil changes would *never* be necessary, with the Oil Filter to remove impurities, and with the Crankcase Ventilator, Thermostatic Circulation Control and Automatic Heat Control to prevent oil dilution.

Now more than a year has passed, and Buick owners in every section of the world —under every climatic condition—have also proved that you never need change your oil if you own a Buick—just add enough to maintain the proper level.

The trouble and expense of frequent oil changes no longer exist for Buick owners—replenishment and inspection of the Buick Oil Filter only are required.

This is but another of Buick's many contributions to the economy and efficiency of motor car operation . . . another instance of Buick's progressiveness . . . another indication of Buick's greater value.

"MILK MAKES DIET FOOL PROOF"

UTHAI VINCENT WILCOX, WASHINGTON

ILK is the one food that makes the diet fool proof," said Dr. G. K. Abbott, the medical su-tendent of the Washington San-m and Hospital, the largest in-tion of its kind in the South At-c States. Dr. Abbott, has had experience in the supervision of nts in sanitariums in many parts he United States. His years of contact with the pa-s suffering from various ses, malnutrition, and y diets has made him an usiastic advocate of the of clean, safe milk.

e explained in a special view that the majority eople seem to insist on g foods with but little ishment. That is, they d not properly balance diet. For example, Dr. tt explained, "that y people enjoy eating kers and milk, yet the kers themselves have little real nourishment practically no vitamin ent. Common white flour kers alone would not ort life, yet with the the dish is made health-

. Abbott, himself a stu- of diet, and prescribing ous kinds daily, was emphatic. "There is hed rice, and white flour ucts of all sorts which ain a very limited unt of nourishment, yet average individual may ect his diet by taking ty of pure milk. Milk es the diet fool proof for unthinking eater, if he only take it in sufficient ities," the doctor de-ed.

Milk is the one perfect ," he continued. "Eggs ain almost all that milk ains, except the lime, containing lime plus the ntial vitamins can sus-life indefinitely."

r. Abbott told of patients would come to sanitari-which were in his ge, many of them suffer-from malnutrition be-e of failure to obey the of health. They had living on foods which lacked ntials for maintaining the body. his condition it would be neces-for them to go on a wholly milk taking milk every few hours.

fter many days of such an eating ram their digestive systems would ond; they would gain in weight strength, restored by the diet of milk. It took the one perfect to correct evils of careless living. The poor whites of the southern ntains are examples of the value milk," Dr. Abbott explained.

"During the winter months when there is only sow belly and corn bread and molasses to eat, scurvy breaks out and sometimes assumes alarming proportions. But medical science in watching these cases discovered that in the spring when these mountain whites could secure fresh milk from their cows the scurvy would quickly disappear.

Scurvy, it was explained, resulted from the loss of the essential vitamins. But milk containing these essentials in a generous measure restored the body balance when it was again obtained.

In a large number of experiments carried on by physicians and dietitians, animals were used in order to obtain reliable facts concerning the food value of milk. Dr. Abbott took from his files a number of photographs, graphically indicating the body-building power of a diet, including milk in generous proportions.

White rats were taken in one instance. One weighed 410 grams. It was fed for a specified period biscuits composed of butter, corn, and milk. In addition, a half pint of milk with a pinch of salt was a part of the ration. This rat grew healthy and large, fat and saucy, and full of fight.

Another rodent weighing exactly the same was fed corn, salt pork, water, but no milk. As a result it was stunted and small and scarcely grew at all. It lacked vitality and almost no ambition. It would have quickly succumbed in a battle with the milk-fed rat.

Dr. Abbott explained that the effect of milk on the rat was similar as that on children. For a child to obtain its proper growth there was need for an abundance of pure, clean milk. Without milk a child would be anemic and undernourished. Its bones would be lacking in the limes necessary, and found and supplied by a diet balanced with milk.

Another photograph which Dr. Abbott showed to his patients to impress lessons as to the right diet, had to do with an experiment conducted at the Elizabeth McCormick Memorial in Chicago.

"Two boys showing marked signs of malnutrition came to the Memorial. They had not been starved in the sense that food had been kept from them, but their food did not properly nourish them, which was evident from the illustration.

"After ten weeks of a diet which included simple food and a quart of milk a day, no one but a trained observer would know that they were the same boys. The vitamin element in the milk contributed greatly to the remarkable change in appearance, weight, and strength," Dr. Abbott said.

According to the experienced physician and surgeon who has made a special study of food and its relation to health, milk is an absolute necessity for growing and developing children. And for adults who wish to escape many of the diseases prevalent, milk is also a necessity. With milk eaten and used as a drink each day there will be far less danger of malnutrition, underweight, and a long train of diseases that follow an improper diet or one that lacks the absolutely essential vitamins.

Municipal Dairy in Russia

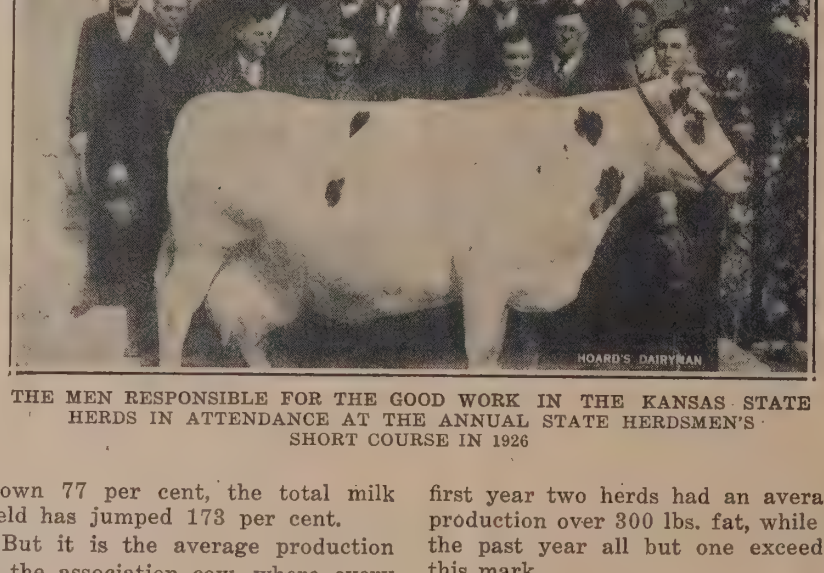
The city of Warsaw is planning to construct a large municipal dairy with a capacity of about 225,000 gallons of milk per day, reports Assistant Trade Commissioner L. J. Cochrane to the Department of Commerce. The cost of the proposed construction, including equipment, will amount to 3,500,000 zloty (about $400,000), of which 1,300,000 zloty will be used for buildings, 750,000 zloty for machinery and other equipment, 650,000 zloty for the establishment of public milk stations, etc., and 680,000 zloty for transportation equipment.

Aunt Ada's Axiom: Not only is it more blessed to give than to receive; but the givers really gain more than the receivers.

THE KANSAS STATE HERD

W. H. RIDDLE, MINNESOTA

MONROE COLEMAN, STATE HERD TESTER



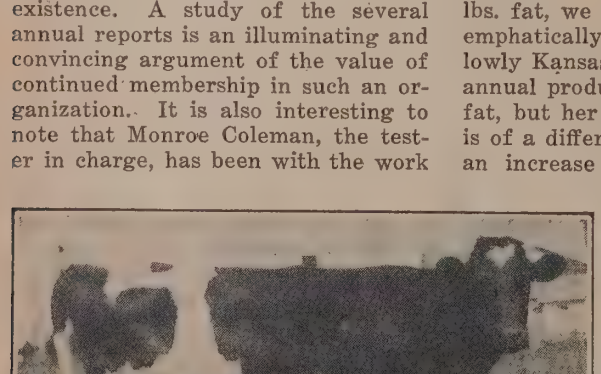
FIVE hundred and ninety-one cows averaging 9,837 lbs. milk, 333 lbs. fat in a year—that is the record of the Sunflower Cow Testing Association, otherwise known as the Kansas State Herds, for the past year. How many associations in the country can show as outstanding a record? Five years of continuous testing plus intelligent feeding and management have more than reaped their reward, and Kansas may well be proud of her institutional herds.

But let us go back and examine some of the facts responsible for such a phenomenal showing. It is a fascinating story of herd progress that will stand comparison with the best.

It was back in the year 1917 that the Kansas legislature, with a view to putting the state herds on a more efficient basis, saw fit to place them under the advisory supervision of the dairy department of the state agricultural college. The good results which have followed from this move are sufficient proof of its farsightedness. An extensive program of improvement was outlined with the cooperation of the State Board of Administration and the superintendents of the different institutions. Regular inspections were made by specialists from the college and every assistance given in matters of feeding and herd management.

However, it was not until the year 1922 that the first comprehensive evidence began to be available of the good results the work was effecting. For in the year previous the twelve herds had been organized as a cow test association and reliable records of production were now to be had in each herd. The Sunflower Association, as it is appropriately called, is now entering on the sixth year of its existence. A study of the several annual reports is an illuminating and convincing argument of the value of continued membership in such an organization. It is also interesting to note that Monroe Coleman, the tester in charge, has been with the work since its inception and without question a considerable measure of the success is due to his efforts and whole hearted interest.

In 1918 the twelve herds comprised a total of 697 head of cattle, of which nine per cent were registered individuals. The annual report for the year just closed shows a dairy cattle population of 1239 head—an increase of 77 per cent in eight years. In that time the number of pure-bred cattle had grown over 500 per cent and they now represent 35 per cent of the herds. Nowhere is the value of milk better realized than in the diets at the different institutions and its consumption is being steadily increased. This means more cows, but at the same time improved methods of feeding and herd management have more than helped in keeping production abreast of the demand. Witness the fact that since 1918, while the number of cattle has grown 77 per cent, the total milk yield has jumped 173 per cent.



THE MEN RESPONSIBLE FOR THE GOOD WORK IN THE KANSAS STATE HERDS IN ATTENDANCE AT THE ANNUAL STATE HERDSMEN'S SHORT COURSE IN 1926

But it is the average production of the association cow, where every cow is tested, in which we are primarily interested. Total production signifies little, beyond indicating volume of output. Have five years of continued testing proven of any benefit to the state herds of Kansas? When we can show, as does the last annual summary of the association, 591 cows producing the remarkable average of 9,837 lbs. milk and 333 lbs. fat, we are rather apt to signify emphatically in the affirmative. The lowly Kansas cow is credited with an annual production of 126 lbs. butterfat, but her sister in the state herds is of a different class. How much of an increase does this high average represent? The figures in the first annual summary (1921-'22, the fiscal year runs from July 1 to June 30 of the following year), show that 476 cows averaged 6,726 lbs. milk, 240 lbs. fat. In other words, the butterfat production of the state herd cow has increased 38 per cent. In the same period the number of cows milked increased 24 per cent. That this splendid showing has not been the work of a few outstanding herds is fully evidenced, by the comparative production figures for the herds concerned, in the accompanying table:

Institution	Cows milked 1921—'22	Cows milked 1925—'26	Average production 1921—'22 milk	Average production 1921—'22 fat	Average production 1925—'26 milk	Average production 1925—'26 fat	Percentage increase 1921— %
			lbs.	lbs.	lbs.	lbs.	
Atchison	18	30	6,784	248	10,370	349	40.
Beloit	29	26	10,177	363	10,169	352	8.
Hutchinson	44	56	6,205	267	9,764	364	36.
Lansing	59	49	6,013	205	9,298	303	47.
Larned	61	88	5,356	202	8,961	310	53.
Norton	18	38	8,694	330	11,344	400	21.
Osawatomie	35	84	8,887	298	9,756	316	6
Parsons	40	37	7,933	279	10,868	376	34
Topeka Hospital	96	90	5,795	193	10,028	327	69
Kansas Vocational School	9	9	4,728	175	8,157	291	65.
Boys' School	27	39	6,840	240	10,892	349	45.
Winfield	40	45	6,406	227	8,743	301	24.

In two instances the percentage increase is not so marked because these herds had already attained a high level of production prior to the organization of the association. In its first year two herds had an average production over 300 lbs. fat, while in the past year all but one exceeded this mark.

Good feeding of good cows more than any other one factor has been responsible for the remarkable showing. A standard ration, largely home grown in character, and with alfalfa hay and silage as its basis, is fed. During the past fiscal year 5,818,109 lbs. milk containing 197,361 lbs. fat were produced. The cost of feed consumed by the cows milked during the year was $55,124.50. This represents an average feed cost of approximately 94 cents per 100 lbs. milk and 28 cents per pound fat, which would indicate rather conclusively that high production also means economical production. With plenty of help available, some of the herds have instituted three-time milking, which has had its effect on the production of the herds concerned:

Hunter of Kewaunee

The Beautiful Kewaunee Valley — Wagon Loads of Fish — Private Pickerel Pool — Spearing Muskellunge Through the Ice

RANSOM A. MOORE, WISCONSIN

S the country began to settle along the lake shore at Racine, grandfather went further north hunting season, until about he reached a point where the Ke-ee River came slowly into the lake. He swung his mackinaw into the river and began sailing up that beautiful stream. He had no difficulty as the water was often twenty or thirty feet deep.

NSOM A. MOORE

He continued about seven miles up the river, al-gh in his circling trip following river he had only gone about two s from the lake. The river began t shallow and the current strong-He landed his boat and a short nce above found the rapids. At oot of these rapids was an Indian ge. Through his knowledge of the an tongue, he learned that they in a wonderful hunting country. andfather purchased about 300 s of the land including the Indian ge. He conceived the idea of cut-the stately pine and making shin-olts. There were many sailing s on the lake and he soon made ngements with the captains of vessels to take his bolts to Mil-ee and Chicago, two thriving s. During the winter, camps were and a crew obtained. The shin-olts were put aboard scows and n down to the river. This seemed quite a business for a time.

1855 grandfather went to Ra- sold his property, and brought family back with him to Kewau- which was then just a little lum-g and fishing village.

re father grew to manhood and rother and himself married and ed in the neighborhood. Nearly whole county was a huge wilder-A few French families located ne river used the stream as their highway to the village. Several e Frenchmen worked in the mill ewaunee. They paddled up and n the river very quickly in their es. When the river froze over used their skates and when y snows were on they used their rshoes. The roads were merely roads and in the spring of the became mud wallows.

THE AUTHOR GOES A-FISHING

ee the two finned beauties which he ked. Picture taken at the author's in in Northern Wisconsin.

A short distance above grandfather's farm a grist mill and a saw mill were erected. During the early spring the pickerel and suckers would run up the river to spawn. In those days no one thought of putting fishways in the dams. The people owning the mill set aside certain days to raise the gate. The water would then gradually flow out of the pond and the following morning the gate would be closed. The fish settled in holes and bends of the river and were caught by the wagonload. I have seen the river for

THE MILL POND, GRIST MILL AND SAW MILL IN THE DISTANCE
On the farther bank of the pond is where I shot my first deer in 1870.

half a mile just filled with people securing fish.

These fish became a great source of food supply to the settlers in the neighboring country who came for miles on fish days. The grist mill had to run night and day because the settlers brought their grists with them and had them ground while they were fishing.

Practically every farmer in the county grew wheat for flour. It was interesting to see the miller and his assistants at work with long chisel-like hammers cutting the little grooves in the stones which revolved one above the other taking the bran off the wheat kernels and grinding the remainder into beautiful flour.

If the farmer was in a hurry, he could make an exchange as the miller knew how much bran, flour, and middlings the customer was entitled to from the amount of wheat delivered. Many of the farmers, however, insisted on having flour made from their own wheat. These were obliged to wait their turn patiently. No cash was ever paid for grinding but the miller took toll.

Barley was also ground between the heavy rocks, merely taking off its hull. It was then known as "pearl barley" and made a very appetizing dish. The mill ran all year.

An interesting incident happened at the saw mill on the other side of the river when I was a boy. Hearing my father say that they were replacing the old over-shot wheel with a turbine, I set out to see it. Men operating mills didn't like to have children around the machinery, so I had to use some ingenuity to get a look at this wheel. I knew that the wheel was under the floor on which they were cutting the logs. The sides of the mill were partly sheeted up. The floor had chutes through which the sawdust was dumped. Much of this sawdust did not go into the river but was banked up so that one had to get through it before he could get to the wheel.

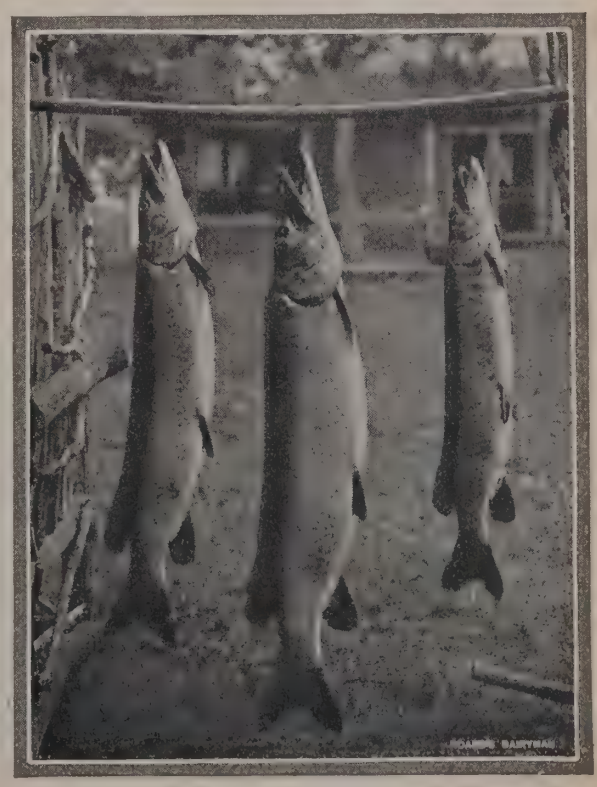
On one occasion I waited very patiently in the lumber yard until the men were pulling up some logs into the mill with a large bull wheel. I dashed over the open space, dug a hole through the sawdust, and was soon down to the turbine wheel. To my astonishment I found that instead of revolving from top to bottom like the old wheel, it went around from right to left and was, as I thought, lying on its side instead of standing upright.

While admiring the wonderful power of this wheel, my attention was suddenly drawn to a big pickerel that swung around in the water and passed under the foam near the wheel. Soon another passed. It was the spring of the year and the height of the fishing season was on, but the pickerel seemed more wary than other fish and we only got a few of them in comparison with suckers and other rough fish. The pickerel was the earliest fish to come up to the dam, usually when the ice was just breaking up.

This, I felt, was a great discovery and I immediately got back through the sawdust and waited for a favorable time to get across to the lumber piles. I dashed across without being observed. It was a half mile to my home and it only took me a few minutes to get there.

I got a spear adjusted a short handle, took a large gunny sack, and returned to the mill. I crawled through the sawdust to the platform, leaving my gunny sack within reach, and was scarcely seated when along came a big pickerel. I speared him beautifully as I had become an expert even at that tender age of seven or eight years. By spearing the fish so that the center tine struck the spinal cord back of the head, the fish was paralyzed. I soon had the sack full but how was I going to get the fish home? I took out one large fish, about eight or ten pounds in weight, and buried the sack in the sawdust. I slid out cautiously and made my way home.

My people, of course, were astonished at such a beautiful fish and when I told them that I had a whole sackful, some even larger than this one, they were even more astonished. Because I didn't want my fishing ground known to others, father and I went for the fish after the mill had closed down, just a little after dark.



I continued spearing fish at this particular place for several springs. Later, the mill was changed and the fishing pool where I spent so many exciting, happy moments was ruined.

One of the very favorite ways of catching suckers was to use a flat bottom boat after the gate had been closed. The fish would rapidly drift into the bends. One could catch fish by the thousands with dip nets by standing on the stern of the boat.

We lived near at hand and always had full equipment for fishing. This was not true of many other settlers. Consequently in my younger days many boatloads of fish were disposed of among the settlers.

One of the favorite ways of putting up fish in those early days was to cut off the heads, slit them down the back, salt them down for one night, and then smoke them. The fire was al-

THE MUSKELLUNGE

The bull dog of many Wisconsin lakes and rivers—one of Wisconsin's noted game fish.

Electricity For The Farmer—Power

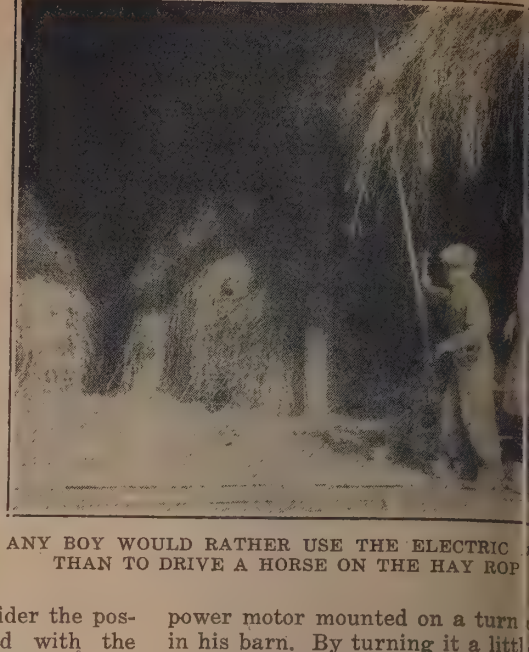
E. R. MEACHAM, WISCONSIN

NO more than fifty years ago, animal power was the only aid to human labor on the farm. My father's lifetime has seen the sudden astounding application of power to the farmer's job. He carried pails of water up the hill from the farm spring; he cut the yellow grain with a curving cradle; he swung a flail on the dusty barn floor. First, windmills came to pump water for him; then steam and later gasoline began to take over jobs that he and horses had done alone before. And now electricity is offering him its power in the business of farming.

It is entering upon a job where the use of power has already grown to a stupendous amount. The Department of Agriculture estimates that farms are using 16,000,000,000 horse power hours a year. Four-fifths of this is for field work. The use of electricity for this has been purely experimental so far in this country, though Europe has plowed both by means of electric tractors, and by plows operated on steel cables. But the remaining fifth of this staggering total offers a present, practical use for electricity on the farm.

The motor which transforms the electric current coming over the wires into actual power is a very clean, compact power unit. It has very few parts to get out of order, only two bearings that demand occasional oiling, nothing to be affected by frost, and little vibration. It starts at the turn of a switch, whatever the weather; requires no fuel nor water; it may be started at any distance from the job. For short periods it can carry a 100% overload without harm. And it comes in all sizes from 1-50 to 500 horse power.

Another distinguishing characteristic of electric power is its susceptibility to automatic control. Switches that turn on or off with variation in pressure, temperature, or other changes in operating conditions make various electric machinery entirely automatic in its operation. The motor that drives an automatic water system is controlled by a switch of this sort. Out on a marsh near the University of Wisconsin, the drainage pump is started by a float when the water level reaches a certain height and stops when the water drops again.



Professor E. A. Stewart of the University of Minnesota, an investigator of problems of rural electrification, recommends three types of motors for use on the average farm: 1, individual motors; 2, a small utility motor; 3, a large utility motor.

The daily use of a motor for some particular job demands that that motor be always set up and in readiness. A motor on the milking machine or the separator could scarcely be detached to do half a dozen other jobs. The time spent in replacing it before each milking would be too expensive. Those motors should be in readiness so turning a switch will start the machines. There are other light jobs, however, which come only occasionally where a motor can do the work at a great saving of time and strength. One small motor can often do half a dozen seasonal or periodic jobs. Perhaps it will run the churn twice a week, or turn the grindstone for sharpening knives during silo filling, the sausage grinder at butchering, and the fanning mill before spring seeding begins. The larger utility motor, probably five-horse power, will run the feed grinder, the concrete mixer, and the wood saw.

This introduction of electric power threatens to reverse the modern tendency toward the use of large units and a big crew of men to hurry through the job. It works in exactly the opposite direction. The smaller power units require fewer men for their operation and take a longer time at the job.

In commenting on this effect of electric power, Professor J. B. Davidson, head of the Agricultural Engineering Department at Ames, says:

"Electric power is very well adapted to light stationary work. To extend the use of electric power into the field of heavier stationary work is a much more difficult problem. To provide electric motors of the capacity of the average gas tractor would call for heavy expenditures for increased capacity in transmission lines and transformers. This excess capacity would be used for a very few days each year. I am willing to venture the opinion that the greatest progress will come through a reorganization of those operations requiring a larger motor. This would mean that the largest motor on any one farm would be kept down to a certain maximum by continuing the operation over a longer period of time. To suggest what might be done, consider the possibility of grinding feed with the small feed grinder supplied by a magazine bin. Not only may a large amount of grain be ground by a small grinder in this manner, but the work may be done at a time when the load on the line is at a minimum. The same kind of regulation could be applied to the pumping of water. In such operations as threshing and shelling, the use of a small motor may not be so easy, but with a crib or grain barn satisfactorily arranged, there is no reason why these operations could not be continued over a longer period, permitting the use of a small motor and a smaller crew."

ANY BOY WOULD RATHER USE THE ELECTRIC
THAN TO DRIVE A HORSE ON THE HAY ROP

BECAUSE IT CAN CARRY GREAT OVERLOADS FOR SHORT PERIODS, THE MOTOR IS WELL ADAPTED TO SAWING

At least two companies are mounting motors suitable for these occasional jobs on two-wheeled trucks that can be pushed from place to place like a wheelbarrow. They are fitted with pulleys of various sizes to provide the proper belt speed for different machines, and long, heavy, weatherproof cable to reach from the nearest electric outlet to the place where the work must be done. A starting switch at the end of another cord makes it possible to control the motor while operating the machine.

The utility motor is not always on wheels. Any motor can be mounted on a truck of the farmer's own making, or on a stone boat that can be dragged from one machine to another. Many farmers make a single motor do several jobs by setting it in such a way that it will run different machines from that one position. An Alabama farmer has arranged his layout so a single motor pumps his water, runs the milking machine, and grinds feed. Mr. W. J. Dougan, a Southern Wisconsin farmer who needs no introduction to readers of Hoard's Dairyman, has a 15-horse power motor mounted on a turn in his barn. By turning it a little way and then another, he can use fill his two silos, grind feed, hoist and elevate his grain into the bi

"I have had that motor for years," Mr. Dougan told me, "an never had a cent of expense on cept for the oil I squirt into the ings now and then."

Mr. George Stillmacher, near on, Wis., has his feed mill an bone grinder a few feet apart i granary. In the wintertime he es his portable motor between and runs both without changin motor. The bone grinder makes meal for the chickens on his own and those of his neighbors as Since bones grind best during th weather when they are thoro frozen, Mr. Stillmacher appre the fact that his motor need warming up, but starts whe presses a button.

During the latter part of Febr and March, Mr. Stillmacher us motor to drive his fanning mill. motor saves a man's time and d more uniform job. It also mak possible to use a sacker. This cu time for the job in two. It take than two kilowatt hours of curre clean and sack one hundred bu of grain.

During the winter months, grinding would keep a portable busy on most dairy farms. For w small mill the farmer can often with electricity more cheaply th can haul his grain to a neighb grist mill and hire it ground.

In the test Professor Davidso ferred to above, the reorganizati the whole job of grinding made automatic affair, saving conside man labor. A 6″ corn grinder w up over a bin into which the gr

loating Alfalfa Fields of ebraska"—The "Mighty Babylon of Today"

rom time immemorial man has erally chosen the land of the val- for his favorite hunting grounds food.

, as ancient historians tried to e the proper location on the map the "Garden of Eden" or the adise of Old," they generally guess it to be where the ancient rs—the Euphrates and Tigris— t in Asia.

braham left Ur in Chaldaea and of that land went Asshur and t Ninevah. And in the valley of Euphrates it was that Nabapolas- founded his empire and built the ity city of Babylon. There it was his son, Nebuchadnezzar built "Seventh Wonder" of the ancient s, "The Hanging Gardens of ylon."

e are told that the wonderful na from the many millions of ers in this ancient, magnificent en were so strong that they pene- ed the air for miles and miles. was my privilege to visit the derful alfalfa fields in the Platte ey between North Platte and rney on the Union Pacific Rail- some time ago.

was driving out of the town Co- they call this town "The Capital he Alfalfa Region," in the Platte ey. As I traveled through this ile valley with its thousands of s of alfalfa in bloom and as I in- d the sweet scent coming off e floating fields, I could not help think about what a wonderful en spot this Nebraska alfalfa really was.

thought about the ancient "Hang- Gardens of Babylon" that I have so much about and I realized we right here in Nebraska can unt it a million times with our y thousand miles of fertile val- land full to the brim with sweet ling alfalfa.

he "Hanging Gardens of Baby- were more or less artificial after and of no great significance to the multitude. That is where we have it over them.

We not alone have the "smell" but we know how to "bottle it up."

For after all we get all the "smell" we want we convert "Our Garden" product into "milk and honey" for countless thousands.

We claim this "milk and honey" is far more necessary to human existence and happiness than all the sweet aroma from all the "Gardens" you may find anywhere else on this wide, wide world.

We grant that history is correct; we admit that it may be true that the wonderful aroma of this ancient "Garden of Old" penetrated the air for miles. But I wish we could allow "Old Nebuchadnezzar" to have a good smell from "Our Garden," "Our Wonder of the World," "Our Wonderful Alfalfa Field," as it waves in its midsummer bloom.

Nebraska. OLE HANSON.

Ship's Doctor: "Hey there! What are you doing out there in the water?"

Cabin Boy: "I'm following your instructions, sir. You said to take the medicine in water, sir."

50,000 People Saw De Laval Separators Get Money From Skim-Milk

DURING the past year De Laval Agents in 17 states held hundreds of educational dairy meetings which were attended by more than 50,000 farmers and dairymen. One feature of these meetings was the "Skimming the Skim-Milk Demonstration" to show how much butter-fat the ordinary separator is losing.

Skim-milk from some separator in use in each community was obtained and run through a new De Laval under the complete observation of all in attendance. The cream recovered in this manner was then immediately sent to the local creamery or cream station, was weighed and tested, and a check received for it.

$78.00 Per Year Average Loss

In hundreds of such public tests the De Laval Separator never failed to recover butter-fat from the skim-milk. The amounts recovered varied in value from a few cents to over a dollar. The average results show that the separators from which De Lavals skimmed the skim-milk were losing butter-fat at the rate of $78.00 a year.

Many people were amazed at the separating losses revealed by these tests and asked for individual tests to be made in the same manner on their own separators at their homes. Any separator user can have such a test made and De Laval Agents will loan a new De Laval for such trial.

Trade in Your Old Separator on a New De Laval

The new De Lavals not only skim cleaner but also have other improvements and refinements. They are the best cream separators ever made and are the crowning achievement in nearly 50 years of separator manufacture and leadership.

With these new features and cleaner skimming you can't afford not to have a new De Laval — especially when you can get a liberal trade allowance on your old machine regardless of age or make. New De Lavals are also sold on easy terms or installments so that you can use them while they are paying for themselves.

See your De Laval Agent or send coupon for full information.

Liming Pays in Tennessee

In five series of experiments on representative soils in different sections of Tennessee, the average yield of alfalfa hay on limed soil was 3.13 tons per acre but on similar soil unlimed the yield was only 1.16 tons per acre. These results were secured the first season after seeding.

In eleven experiments with red clover the average yield of field cured hay on limed soil was 2.31 tons per acre, whereas similar soil unlimed gave only 1.48 tons per acre.

In twelve series with corn the average yield per acre on limed soil was 36.5 bushels but where no lime was applied it was only 30.8 bushels. In Knox County, plots which received six tons of manure per acre every two years gave a total of 279 bushels of corn per acre for eight years of continuous cropping. In the same period and under the same conditions, except that an application of two tons per acre of ground limestone was made at the outset, adjoining plots produced at the rate of a total of 350 bushels per acre for the 8 years. The increase for the 2 tons limestone was 71 bus. corn.

FINE ART CALENDAR

Appreciative of the enthusiasm with which the farmers of America have received my No-Buckle Harness, thereby creating a growing demand which has again compelled me to enlarge my factory, I wish to give every farmer in America a fine calendar. It is a beautiful work of art in three colors, the creation of one of the best American artists.

This fine calendar sent free upon receipt of the coupon below. If you desire my big harness catalogue, check it also. Wishing you a prosperous 1928. 6-28

Sincerely, James M. Walsh Co.

Banish the *Never-Ending Grind of* Hand Milking

YOUR grandfather had to milk his cows by hand. But you don't—any more than you have to drive to town with an ox team. Isn't it time to banish forever the drudgery of hand milking? Don't be the last to give up the old way. Join up with the thousands of farmers who now milk their herds easier, quicker, better and more safely with the Burrell Milker. The time you save can be used for other productive work, for leisure, and for pleasure—no other farm investment will give you such large returns.

The Burrell also eliminates hand stripping—*It Milks the Cows Clean.* That's why you'll finally come to the Burrell.

Single Tube System

D. H. BURRELL & CO. INC.
10 Albany St., Little Falls, N. Y.

You Need This Book

Every cow owner needs it—whether he is now milking by hand or machine. It's not a mere catalog, but a 32-page profusely illustrated book which is a guide in both selecting and using a milking machine—backed by 67 years' experiment and experience. You owe this book to yourself. It's *free.* Send for it now.

Value of Sweet Clover Demonstrated

HOARD'S DAIRYMAN:—The value of sweet clover is well known throughout the Henry County Association of Illinois. Six of the members have successfully used it as pasture with very good results. One member carried 15 head on twelve acres for four months. The cows seemed not to care for much grain and held up in production. They produced butterfat at a cost of 9 cents per pound.

Another member had twenty cows on bluegrass pasture and was apparently furnishing enough feed for the cows. He supplemented the pasture with a good grain ration. In August while on the bluegrass he had three cows to freshen. In September he turned the cows on a spring seeding of sweet clover, the grain ration remaining the same and there were no cows fresh. The average production increased four pounds, while the association average fell for the month.

The use of sweet clover as a hay crop has been successfully tried by one member. This member cut the spring seeding late in the fall, cured it well and put it in the barn. The cows were fed the sweet clover hay, silage, and a balanced grain ration. They ate approximately ten pounds per head daily. During the time of feeding the sweet clover hay the cows were dehorned. There were no bad effects and the owner said the cows bled no more than usual. He fed all the sweet clover hay and then shifted to alfalfa hay. He found the alfalfa hay to be more palatable but records on the herd show there was not any increase in production. This man prefers alfalfa to sweet clover because it is more palatable, but has no objection to sweet clover hay.

Eighty per cent of the members of the association have a seeding of sweet clover for use as pasture next year.

JESSE L. BARNES, Tester.

What Sold Him

HOARD'S DAIRYMAN:—"I'll take him." This was the statement made by a bull buyer to one of the breeders in the Long Prairie Association of Minnesota. He came near not buying a bull from this breeder because he could get another bull $25 cheaper, but when shown the records on the dam of this bull he decided to take him in preference to the one offered him for $25 less money but out of an untested dam. He was wise in his decision. Certainly a bull out of a 400-lb. dam is worth many times more than one out of an untested dam.

Life's journey on the dairy farm is too short to be made in company with an inferior sire. Let us assume that the sire in question produces daughters who average only ten pounds of fat a year more than those of the one out of an untested dam, that this dairyman raises only five of them and then keeps each one six years. There would be a difference of 300 lbs. fat, which at 40 cents a pound would be worth $120. These are conservative figures.

Let us build for the future when buying a sire and see a little further ahead than the initial cost. Let the records guide us.

B. J. ROSENQUIST, Tester.

Cost of Keep and Profits

In his annual report of the Sioux Falls Association of South Dakota, Ben Nelson publishes the following records of two cows in the same herd:

	Cow 1	Cow 2
Silage and dry roughage	$ 24.83	$ 22.58
Grain	36.41	33.92
Pasture	6.60	6.60
Labor	20.00	20.00
Depreciation on cow per year	8.00	5.00
Interest on cow investment	7.20	4.80
Interest on barn investment	2.66	2.66
Depreciation on barn per cow, per year	1.60	1.60
Insurance on barn	.40	.40
Insurance on cow	.40	.30
General expenses (veterinary, bedding, etc.)	5.00	5.00
Total expenses	$113.10	$102.86
Lbs. of butterfat produced	370.9	140.1
Lbs. of milk produced	10,914	3,948
Per cent butterfat	3.4	3.6
Ave. price of butterfat	.40½	.42½
Value of butterfat	$150.01	$59.57
Value of skimmilk	26.25	9.50
Value of calf	8.00	5.00
Value of manure	12.00	12.00
Total value	$196.26	$86.07
Profit	83.16	
Expenses not including feed cost	45.26	39.76
Values not including butterfat	46.25	26.50
Profit	.99	
Loss		13.26

Mr. Nelson adds to this the following comment: "Cow No. 2 was dry during the late summer months, a time when the price of butterfat down. This accounts for the d ence in the average price of butte Under average conditions the val butterfat above feed cost should resent the net profit. Other in should be sufficient to cover all expenses, but in the case of poor ducers it does not."

The Sun is Bright Tod

HOARD'S DAIRYMAN:—A far was overheard to remark rece "If we only knew in 1920 wha know now about feeding, culling production we could have ma killing with fat at 82 cents a po

It did not come amiss to re this farmer that the golden o tunity lies in the present and a and not in the past. He lost no in signing up in the Chetek I Herd Improvement Associatio Wisconsin. Now he sees things new light, for he has the evidenc each individual cow. Each one pears to him in a new light and on an individual personality. He authentic information on whic eliminate the undesirable cows a correct the shortcomings in his r ods of feeding and herd manage

What he has done any cow mi farmer can do. There are cour opportunities in this "Grand Old ger State" (and any other stat do as this farmer did.

Announcing Our New Ball-Bearing Cream Separators!

A BEAUTIFUL *black-japanned, ball-bearing cream separator for every dairying need. Six sizes, capacities 350 to 1500 pounds of milk per hour —"for one cow or a hundred." Hand, belted, and electric. Demonstrated, displayed, sold and serviced by McCormick-Deering dealers in every community. Write for the completely illustrated booklet about the new machine.*

The NEW McCORMICK-DEERING

THE Harvester Company is proud to announce a distinctly modern line of cream separators, new in design, improved throughout, which we believe is absolutely qualified to render a new all-around satisfaction not to be had from any other separator.

Every one of the six sizes of the new McCormick-Deering now has *high-grade ball bearings at all high-speed points.*

To make the machine as durable and pleasing as it is possible to achieve, the celebrated process of exterior finishing called *japanning* has been employed in the new McCormick-Deering. You will certainly admire the *hard, brilliant, mirror-like lustre* produced by many coats of japan finish requiring eighteen hours of baking at high temperatures.

These are features of *easy running, durability, and beauty.* The New McCormick-Deering has many other features and details of design that combine to make it *a most attractive and thoroughly efficient cream separating machine.*

Let the machine *prove itself* before your eyes, and before you buy. The McCormick-Deering dealer will gladly give you a complete demonstration without obligation, on your farm or at his store.

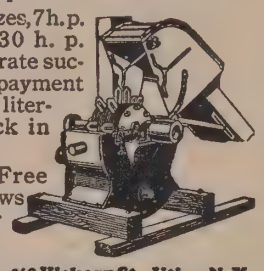
You Can't Beat the Old Reliable

JAY BEE Humdinger
CRUSHER GRINDER PULVERIZER

For fine, fast, uniform grinding of every kind of feed, biggest capacity, lowest grinding cost per ton, absolute dependability at all times, freedom from breakage and costly repairs, you can't beat the **"JAY BEE."**

Not 1c for Repairs in 5 Years



Mount Meadow Farm, Gadsden, Ala., writes: "We have never spent 1c for repairs nor have we had a shut-down for one minute with our **'JAY BEE'** in 5 years. We grind practically everything and got baling wire, nails and the like into the mill which have failed to damage the mill one bit.

"Has Never Failed Me"

S. Shipman, Guide Rock, Nebr., writes: "I have ground more than 15,000 bushels of corn and at least 400 tons of hay and fodder, and haven't spent a dime on my **HUMDINGER** yet. One sure thing, when you are feeding full feed, a breakdown and waiting for repairs costs lots of money. My **HUMDINGER** has never failed me yet."

Free Feeding Booklet

Nothing to wear dull or break. Grinds the feed cool. Over 7,500 in use. The best mill—cheapest when work is done. 3 sizes, 7 h.p. to 30 h. p. Fordson will operate successfully. Easy payment plan. Descriptive literature free. Stock in principal cities.

Send for this Free feeding book. Shows way to greater feeding profits.

Wonderful New Method!

Milks Cows Like No Other Machine Ever Milked Cows Before

Never!—No, Never!—have you seen anything just like it. Farmers clear across the continent are talking about the great Surge Milker and its wonderful new milking method. It is making records for breeders who never dared use a machine before. And they all say it is the easiest machine to clean they have ever seen.

Write today—NOW—for the NEW Surge Catalog telling all about this great wonder. This book is FREE. You need it. It contains a lot of information worth real money to you. Write for it—NOW.

Operates Modern Milk Factory

MR. and Mrs. T. Ed. Kjos of Minnesota are making good in the milk business on the farm, although both were born and raised in town. Mr. Kjos got some experience as a boy, going out for work on farms in summer. He attended the Minnesota School of Agriculture and graduated from there in 1913. His wife finished school the same year from a course in nursing and a year later they started out farming together. They have been in the milk business only two years. Before that their cream went to the local creamery. They sell around 300 quarts milk and 50 pints cream daily.

Mr. Kjos says there is a great deal of work in connection with his business but that it is a great pleasure in pleasing people and increasing business, as is shown in the following article written by "An Appreciative Patron:"

"Every morning I find a package of food at my door. It is the most healthful of all kinds. It comes in a clean glass container. It is a white fluid. Its name is milk.

"Being of a curious frame of mind I decided one day to go through a milk factory. I had been through a flour mill and seen how wheat was cleaned, ground, and turned into snow white flour. I knew about other foods I ate. I had read about government food inspectors, but all these things were made in large factories out of town. I wondered about our milk factories here at home.

"So I decided to run out to Kjos' farm and take a look around. I found Ed. Kjos on the job, but he wasn't sitting under a cow on a three-legged stool as I expected. Instead I found him busy with motors, machines, etc., like any other factory. The barn was lighted by electricity; the cows were being milked by electricity; the cream separated by electricity; bottles washed by electricity. Ah, ha, here was a modern factory indeed! I must look this over carefully.

" 'What's that man cleaning that cow for?' I remarked.

" 'We curry and clean the cows every day,' replied Ed. 'To provide milk that will be clean and stay sweet and good a long time everything must be kept clean. We wash the udders of every cow before each milking.'

" 'Where are the milk pails?' I inquired. 'We don't need them any more,' was the answer. 'The open pail and hand milking caught the dirt and gave the milk a bad flavor from exposure to barn odor, so we installed a sanitary milking machine which draws the milk from the cows, carrying it to closed cans which we carry out of the barn at once. We take the machine apart and sterilize it with boiling water and an antiseptic solution after each milking.'

"I watched him unfasten the milk container, pour the milk through a strainer into a large can. With that he started for the door.

" 'Where are you going,' I called.

" 'To the dairy building; come along,' he replied. "Following along we came to a small building not far away. The opening of the door revealed a dazzling white, well lighted room.

"The milk was now poured into a vat through a strainer consisting of eight thicknesses of clean gauze, from which it ran over the cooler. A constant stream of cold water was running through the cooler so the milk was quickly cooled and ran into a large white porcelain vat.

" 'What's that for?' I inquired. 'It looks something like Louis Kierland's pop bottling machine.' 'That's to bottle the milk,' said Ed. 'We can fill a dozen bottles at one time so it goes pretty fast. After every milking we run boiling water through it and once a day take it apart, clean the parts, and rinse in an antiseptic solution more powerful than carbolic acid but harmless to people, odorless, and tasteless.'

" 'There's one thing I can't understand,' I said, 'and that is how you get the bottles clean. My wife always washes out the bottles before setting them out but it's impossible to do a good job.'

" 'That's easy,' laughed Ed. 'See that motor over there with the brush attached to it, and the large vat below? That does the work in no time. After washing we rinse with antiseptic and then boiling water.'

" 'Where do you get all the boiling water?' I inquired.

" 'There is my heating plant in the corner,' he responded. 'I ge water pressure from a large rese outside. The water is piped i the milk cooler, water heater, use plenty of it.'

" 'So I notice,' I replied as I l around.

"The woodwork was all enameled and the floor concrete.

" 'I'll bet the state inspector the looks of this,' I remarked.

" 'Well,' responded Ed. modes don't want to brag too much my place, but you know he dro here twice a year unexpectedly he told me that although not as as some, I had as nice and cle place as any in the state.'

" 'That's fine,' I said. 'Bef go I want to say I appreciate ting milk from a place that is so clean and sanitary.'

" 'Thanks,' was the response. you came out to look things Visitors are always welcome any and any time. I wish every p would come out and see for hi just how we run things.'

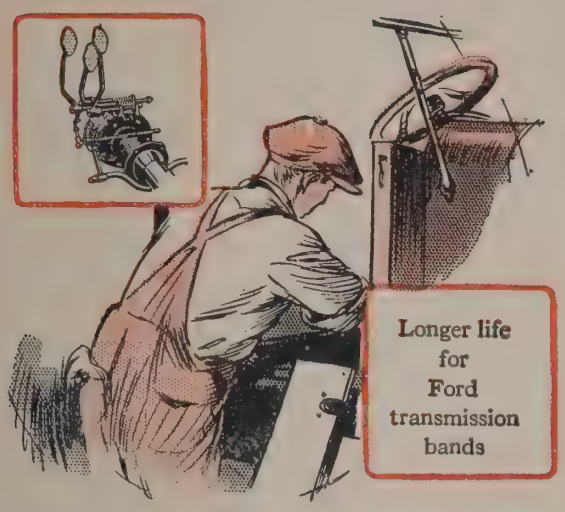
"I left, thinking to myself that I knew why Kjos' cream kept so long and the milk was al sweet and clean and tasted so g

INTERIOR OF MR. KJOS' DAIRY HOUSE SHOWING VAT FOR WASHING MILK BOTTLES AND THE PLANT IN THE CORNER FOR HEATING WATER

ANOTHER VIEW OF MR. KJOS' DAIRY HOUSE SHOWING WHERE THE MILK IS COOLED AND BOTTLED

Mr. Kjos takes great pride in keeping everything neat and clean.

Fly Salt

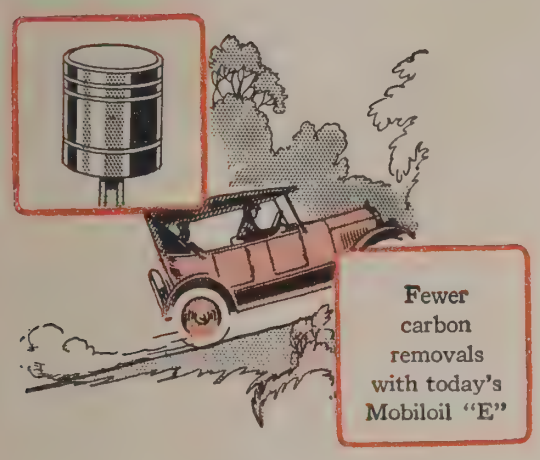


A salt mixture termed "fly s containing 9.77% free sulphur, been sold extensively throughou Middle West, under the represe tion that when fed to cattle, en sulphur was excreted with the spiration to prevent flies from b the cattle, thereby resulting in g er gains to beef cattle and preve losses in milk flow from fly attac

Two experiments were carrie by the Kansas State Agricul College—one at the Hays St with a herd of 20 high grade H ford yearlings against a compa herd kept under the same condi fed common salt; the other with dairy cattle at the Kansas Agr tural Experiment Station fed the salt" against animals fed con salt which was sulphur free.

The gain in weight in the lings in 156 days was approxim equal and the dairy cattle fed "fly salt" showed a very simila cline in milk flow to the check mals. The salt was wholly ineffe as a fly repellent, for animals fed "fly salt" were tormented to the extent as those fed common salt. fly salt cost six times that of the mon salt, and was not relished b animals.

Aunt Ada's Axiom: Remember we wouldn't know what happine if we didn't have some sorrow f contrast.



A scientific achievement!
New Ford economies–New Ford smoothness

The achievement of the Mobiloil engineers in producing the improved Mobiloil "E" does not lie in any *one* characteristic of this finer Ford lubricant, but in its ability to cut operating costs in so *many* directions.

With the improved Mobiloil "E" in your Ford crankcase you insure smooth starts and smooth stops. And more—you definitely extend the life of your transmission bands. The improved Mobiloil "E" provides this new margin of safety in driving your Ford.

Still more mileage between carbon removals with today's Mobiloil "E"

In any car carbon is a costly menace. Carbon accumulation cuts power. It jumps gasoline consumption. Oil consumption, too. And carbon removal jobs are a real item in operating expenses.

With today's Mobiloil "E" you will experience unusual freedom from carbon. At the same time your transmission bands will keep soft and pliable. The combination of these *two* Ford advantages is unique.

Cheapest lubrication

Mobiloil "E" makes no claim to be a cheap oil. It costs a few cents more per quart than ordinary oil. But Mobiloil "E" gives you lower cost per mile and per year. *That* is what counts. Thrifty Ford owners never say that Mobiloil "E" is high-priced. They have had too much experience with the oil itself. Mobiloil "E" contains an extra margin of safety to meet every lubricating need of the Ford engine, the Ford clutch and the Ford transmission.

Fill your Ford crankcase today with four quarts of the improved Mobiloil "E". The genuine Mobiloil "E" can be obtained in original one-gallon sealed cans or by the quart from Mobiloil dealers.

New smoothness of operation and full power will be immediately apparent. And road tests have proved that you may confidently expect less carbon, and a longer life for your Ford engine.

The year around use Mobiloil "E" in your Ford car and truck. In your Fordson tractor use Mobiloil "BB" in summer and Mobiloil "A" in winter. The nearby Mobiloil dealer will give you a substantial discount on barrel and half-barrel orders of Mobiloil.

YOUR guide—if your car is not listed below see any Mobiloil dealer for the complete Chart. It recommends the correct grades for all cars, trucks and tractors. And remember that . . .

609

automotive manufacturers approve it!

The grades of Gargoyle Mobiloil, indicated below, are Mobiloil "E," Mobiloil Arctic ("Arc."), Mobiloil "A," Mobiloil "BB," and Mobiloil "B."

EDITORIAL COMMENT

THIRTY-SEVEN Illinois dairy farmers owning 733 cows were members of a county herd improvement association and co-operated with the Illinois College of Agriculture in keeping dairy cost records. It was found that it cost on the average $164.72 to keep a cow for a year and $2.08 to produce 100 lbs. of milk.

The men who belong to this dairy improvement association are evidently producing milk at lower cost than the average dairy farmer. A great many cows would find their way to the butcher if their owners kept a record of what they are doing. A great many acres, too, would pass into disuse if the owners would keep track of the returns and the cost to operate them.

THE Bureau of Dairy Industry has shown by the tabulation of 70 records that the average error due to testing one day in two months was 3.8 per cent. The greatest error was 12½ per cent. For small herds the Bureau recommends one day testing in two months. This makes it possible for one tester to take care of 50 or more herds and makes the expense of testing so small that no one milking cows can afford to not have a record of each cow. We can hear some say that the error is too great when testing is done once in two months. This can be said—that we can conceive of nothing that would develop the dairy industry faster if every dairy farmer knew within ten per cent what each of his cows produced. Such knowledge would revolutionize the dairy industry.

AGRICULTURE REQUIRES THINKING

"Unless I misread the mind of the farmer he is tired of being deluged with oratory and deluded with quack remedies that remedy nothing. He is tired of schemes for farm relief that relieve nothing save the tension of criticism during a presidential campaign. He is tired of credit schemes that do little more than help him go into debt more easily, when what he needs is a development that will help him get out of debt. He is tired of hastily trumped-up co-operative schemes that take his time and money for a season and then go on the rocks from poor business management or petty internal wire pulling.

"But if the farmer is to escape from this sickening cycle of insincere promises and ineffective programs he must undergo the intolerable fatigue of thinking realistically about the issues of agriculture."

These statements are taken from an address delivered by Dr. Glenn Frank before the Wisconsin Farm Congress. We do not believe the thinking farmer is particularly tired of being deluged with oratory and deluded with quack remedies that remedy nothing." He is paying little or no attention to them. It is not uncommon to find that the successful farmer fully understands the real purpose of certain men and comprehends also how little they have done or can do.

President Frank, however, hits at the heart of the agricultural problem when he says, in substance, that the "farmer must undergo the intolerable fatigue of thinking realistically about the real issues of agriculture." We have many times stated that the farm problem will be solved by those engaged in farming. We have urged the formation of local co-operative organizations, not that we believe organization alone will place agriculture upon a proper basis. It is the foundation, however, upon which an agricultural program must be built. In organizing local co-operative enterprises, leadership is developed and the members are taught what must be done to build communities. If every farm community directed itself to doing the things within its power the firmest foundation would be laid for building a sensible and remunerative system of farming. We are wasting time when we attempt to improve agricultural conditions by building from the top down. We must build from the bottom up. More farmers must be willing to undergo "the intolerable fatigue of thinking realistically" about the agriculture of their farms and their communities. They must also learn how to work together.

HERBERT W. COLLINGWOOD

Herbert W. Collingwood, for forty-two years editor of the Rural New Yorker, is dead. He was born at Plymouth, Mass., in 1857; graduated from the Michigan College of Agriculture in 1883; and married Lulie D. Sullivan in 1888. For two years he was editor of the Southern Live Stock Journal published at Starkville, Miss., and in 1885 he became editor of the Rural New Yorker.

Mr. Collingwood was a noted editor and author. He devoted himself principally to editing the Rural New Yorker, but he also wrote several books of more than ordinary merit outside the field of agriculture. Hope Farm Notes were perhaps his one great accomplishment, for in them there was such a human touch and a homely philosophy that his readers were fascinated and their interests captivated.

A thread of sincerity runs through all Mr. Collingwood's writings and he gained the confidence and good will of those who read his editorial page. His readers knew his first interest was in farm life and in the things which would improve it. It requires a man of character and understanding to direct the editorial policy of a paper that holds the confidence and respect of its readers steadfast for a period of forty-two years. Papers and magazines are published for various purposes—some to please and entertain; others for advertising purposes, propaganda, and the like; and still others to give accurate information and wise counsel.

The kind of journalism Mr. Collingwood chose to follow was that giving sound information on the best farm practices and wise counsel. He may not always have been right in his conclusions and advice, but his readers knew that whatever he wrote or spoke expressed his honest opinion. In his death farmers have lost a good friend and a capable counselor.

FEED FOR PROFIT

The proper feeding of dairy cows is essential to profitable returns. Much feed is wasted because cows do not receive the right kind of feeds and the result is low production at heavy expense. If the cow's ration lacks in protein she is unable to produce milk to her full capacity and invariably she wastes carbohydrates, heat-making elements. For example, a cow given all the timothy, corn, and oats that she can consume will not receive enough nourishment to produce profitable flows of milk. A ration made of these feeds lacks in protein and results in wasting feeds and low milk production.

The dairy cow must have an adequate supply of protein for that is one of the essentials needed in the making of milk. The casein of milk is largely protein and anyone who has made cottage cheese knows that this is a large and important part of milk. If the cow cannot get enough protein to make her maximum quantity of casein she is limited in her fat production.

One of the chief causes of low production and unprofitable returns in dairying may be attributed to cows receiving an inadequate supply of protein. Every dairy farmer should check his rations and make sure that each cow is receiving all the protein she can handle economically. In making a mixture of feed it is well to have it made of four or five ingredients, and more will do no harm. In using a variety of feeds the danger is avoided of feeding an incomplete protein, that is, a protein lacking in some element. No single grain feed has a complete protein, and for this reason it is necessary to use several feeds in order to make a mixture that is sure to be right.

WHY FOLLOW BLIND LEADERSHIP

"Plan a meeting to help milk producers themselves by improving the economy of their duction and the quality of their product an many places you won't get a corporal's guard to hear the speakers or take part in the discuss But advertise a meeting to lambast distribu and consumers of dairy products and you get a hall in town big enough to hold 'em."

These are the words of a well known educ in the dairy industry. He was discussing the culty in arousing producers of milk in some tions to the needs of giving attention to the fu mental factors in the conduct of their busines

Why do we laugh at the other fellow when policeman calls him down for driving on the wr side of the road and scowl when our own atten is called to driving without a license?

Why do we clap our hands when some polit spellbinder figuratively and with scathing denu ation takes the hide off of capital, transportat and finance for their alleged efforts to reduce a culture to economic serfdom and stay away f the meeting called for the purpose of helping u clean up our own back yard with respect to org zation, co-operation, and a much needed elim tion of scrub cows?

Why do we follow poorly informed and o blind leadership, shutting our eyes to what most successful dairymen in our community doing to beat down the menace of fear by sub tuting faith in nature's benevolence and in t own mental and physical skill?

Why do we cry over spilled milk and refus help catch the cow?

The answer is found first in our unwillingnes assume all of the responsibility necessary the successful conduct of all our business. want good prices for the crops we feed our c but we don't want to walk across the road to h someone suggest that there is a weak place in way these crops are fed or that some of registered cows would earn more money if sent the butcher.

In the second place we have become the victi of soaking up altogether too much sympathy f those who would lead us out of the alleged da ness of agricultural despondency by promising to throw a monkey wrench into the wheels of other fellow's business and to anoint our own e linquencies with the salve of political sophis All of which gets us nowhere and nothing. the meantime the wheels of progress have b turning for those who know how to turn th Their number is legion. They do their work qu ly, always seeking after helpful information wh ever it may be found. They are the "corpor guard" at meetings called for the purpose of fi ing out how they may help themselves individu or collectively, and they bear the brunt of init ing, testing, and disseminating improved meth many of our readers are numbered among then

In every community are farmers who light th own lantern and hold it aloft that they might stumble in the surrounding haze of discont Let us look around and imitate their good wo In many counties are groups of farmers do something collectively better than it could possi be done individually. Let us sit around the ta with them and find out why and how they succ and then go home and imitate their good wor In every state one may find successful co-operat marketing agencies, not a few of which h reached gigantic proportions. Let us profit their experience and follow their example.

We hold to the opinion that progress is the result of advancement by a comparatively few individuals whose accomplishments become guide posts for the rest of us to follow as imi tors. Those who would solve our delinquen with political palaver have had their day. Let continue to save ourselves by learning more ab the good works of men whose advancement worth imitating.

A Calf Ration

hat do you think of a mixture of 25 lbs. bran, s. oats, and 10 lbs. linseed meal as feed for ing calves that are getting skimmilk?
hat is there in ropes that are tied around s of twine that calves like? Is there anything such ropes could be soaked in so that calves not suck them?
oodville, Wis. R. O.

skimmilk is fed liberally, say from 12 to 15 ds per head daily, and the calves are receiving me hay, the mixture proposed is rather high otein for economy and best growth. We would er, if available, a mixture of 100 lbs. of ground , 100 lbs. ground corn or barley, 50 lbs. bran, 25 lbs. linseed meal. Under ordinary condi-, the regular herd ration for milk production es a good calf ration. If legume hay such as r or alfalfa is not fed, the present feed mix- is a good one.

e do not know of any special reason why the s tied around sacks of twine should be appetiz- to calves, other than the general foolish appe- of young animals or possibly the fact that appetite is depraved owing to the absence of in minerals in the feed that they are now re- ng. If the calves have access to good legume that is grown on an acid-free soil, and are oth- se properly fed, we wouldn't ascribe it to a de- ed appetite. The best course of procedure d be to remove the temptation from the calves, we anticipate that if these ropes were soaked reosote oil, it would probably render them dis- ful to the calves.

Simple Rules for Feeding Cows

n you give me some simple, general rule for ing rations for my cows? I do not seem to find or else do not have the required inclination to these out on paper with a pencil. I do not it being too old to learn, but then—well, you the universal human failing of wanting to do ing the easiest way if it will bring results.
inois. G. N.

here what might be termed standard feeds are lable, it is possible to make rations after sim- ules that give satisfactory results.

good practice is to feed all the good roughage will eat because it is usually the cheapest ce of nutrients. Furthermore, the cow's di- ve apparatus is made to handle large quanti- of roughage. The cow of ancient times got ing but roughage.

gume hay, if not constituting all the rough- is the most important part of any combina- of roughages. Silage and a legume hay fed to limit of appetite is the best and most simple with respect to feeding roughage. This will sually about one pound hay and three pounds e daily per 100 lbs. live weight of the cow.

ain mixtures are made according to the hage or combination of roughages they are to fed with, paying particular attention to the in content of such mixtures. A combination of e and legume hay requires a grain mixture will yield about 12 per cent of digestible pro- Where the legume is alfalfa hay, the per- age of digestible protein need not be over 12 cent, and could be as low as 10 per cent, and erly balance the ration. Silage and red clover require a little more than 12 per cent of di- ble protein in the mixture. Silage and mixed in which not more than 50 per cent is legume require a mixture yielding between 15 and 17 cent of digestible protein; silage and non-le- e hay require a mixture yielding from 18 to er cent of digestible protein.

ow can such mixtures be made without actual- guring them out?

mong the carbonaceous feeds we have several ones such as corn, oats, barley, grain sor- n, and hominy feed. Among the high protein s we have linseed and cottonseed meals, gluten gluten meal, and ground soy beans and soy meal. Among the light, bulky feeds of medi- rotein content we have bran.

mixture yielding about 12 per cent of digesti- rotein can be made of 300 lbs. each of any two he carbonaceous feeds, 100 lbs. bran, and 50 each of any two of the high protein feeds.

mixture yielding 16 per cent digestible pro- can be made of 200 lbs. each of any two car- ceous feeds, 100 lbs. bran, and 150 lbs. each of two high protein feeds.

mixture yielding between 18 to 20 per cent stible protein can be made of 150 lbs. each of two carbonaceous feeds, 100 lbs. bran, and 200 each of any two high protein feeds.

feeding the grain mixture a simple rule to w is to feed those breeds whose per cent of butterfat is 4% or less at a rate of 1 lb. of the mixture to each 3½ to 4 lbs. of milk produced; and to breeds whose test is higher, at a rate of 1 lb. of the mixture to each 2¾ to 3¼ lbs. of milk produced. This will vary somewhat according to the quality of the roughage as it affects palatability and according to the likes and dislikes of individual cows.

Milk Prices According to Test

What is the difference in cost of producing high and low testing milk? Based on cost of production, how much should I receive per hundred for milk testing 4.7 per cent when $2.40 is paid for 3.5 per cent milk?
Jefferson, Wis. B. C. P.

While local custom and trade conditions largely determine the price differential paid for milk of different tests, there is no question that it costs more to produce high testing milk and there is a considerable amount of evidence on which to base a reasonable estimate as to the relative costs of producing milk of various tests. Professor Gaines and his associates at the Illinois Agricultural Experiment Station have given this subject careful investigation, and their conclusions are given in the following table showing the price differential per point in test that a farmer should secure to equalize the cost of producing high and low test milk:

	Base fat percentage		
	3.0	3.5	4.0
Base price per hundred	Price differential per hundred which is proportional to feed cost		
	Cts.	Cts.	Cts.
$1.00	1.77	1.62	1.50
1.10	1.94	1.79	1.65
1.20	2.12	1.95	1.80
1.30	2.30	2.11	1.95
1.40	2.47	2.27	2.10
1.50	2.65	2.44	2.25
1.60	2.83	2.60	2.40
1.70	3.00	2.76	2.55
1.80	3.18	2.92	2.70
1.90	3.36	3.08	2.85
2.00	3.53	3.25	3.00
2.10	3.71	3.41	3.15
2.20	3.89	3.57	3.30
2.30	4.06	3.73	3.45
2.40	4.24	3.90	3.60
2.50	4.42	4.06	3.75
2.60	4.59	4.22	3.90
2.70	4.77	4.38	4.05
2.80	4.95	4.55	4.20
2.90	5.12	4.71	4.35
3.00	5.30	4.87	4.50
3.10	5.48	5.03	4.65
3.20	5.65	5.19	4.80
3.30	5.83	5.36	4.95
3.40	6.01	5.52	5.10
3.50	6.18	5.68	5.25
3.60	6.36	5.84	5.40
3.70	6.54	6.01	5.55
3.80	6.71	6.17	5.70
3.90	6.89	6.33	5.85

The "base price per hundred" and the "base fat percentage" referred to above are the terms usually used in stating milk prices; as, $2.40 a hundred for 3.5 per cent milk—$2.40 is the base price and 3.5 is the base fat percentage. The "price differential" is the amount added or deducted for each "point" (one-tenth of one per cent) in test above or below the base fat percentage; as, if 4 cents is allowed per point test, then 4 cents is the price differential. The amount given under the heading, "price differential per hundred which is proportional to feed cost," is the amount that should be paid per point test if two farmers are to get back the same relative costs of production for milk of different tests. If $2.00 a hundred is the base price of 3 per cent milk, the table shows that the price allowed per point test in each 100 pounds milk should be 3.53 cents if the producers of high and low testing milk are to get equal justice on the basis of relative costs of production. If the price per point test is less than 3.53, it is favorable to low testing milk; if more than 3.53 cents, it is favorable to high testing milk.

In answer to the specific question in the inquiry above: If the base price is $2.40 a hundred for 3.5 per cent milk, the "price differential" (allowance per point test) should be 3.9 cents according to the table when consideration is given to the feed cost of milk production. If the milk tests 4.7 per cent, it is 12 points higher than the 3.5 base fat percentage, and the farmer should receive 46.8 cents (3.9 x 12) more per hundred than for 3.5 per cent milk, or a total of $2.868 a hundred.

To make the use of the table more clear, we might assume that the base price was $2.40 a hundred for *4 per cent milk.* In this case the allowance per point test as given in the table would be 3.6 cents. If the milk sold tested 4.7 per cent, it would be 7 points higher than the base fat percentage and the farmer in this case would receive 25.2 cents (3.6 x 7) more per hundred than for 4 per cent milk. In like manner, a farmer producing 3.5 per cent milk would receive 18 cents (3.6 x 5) less per hundred than the base price of $2.40 for 4 per cent milk.

The table given above is the result of rather complex mathematical computations and it is difficult to make a short and simple explanation. For those interested in this phase of the subject, we suggest writing Professor W. L. Gaines at Urbana, Illinois, for bulletins giving the technical data and evidence on which the conclusions are based. Without further explanation we give the formula by which the above table was computed and with the use of which other computations as to price differentials may be made for other base milk prices and other base fat percentages, as follows: The price differential is found by multiplying the base price by the quotient resulting from the division of 0.1 by the sum of the base fat per cent plus 2.66. Therefore, if the base price is set at $2.40 for 3.5 per cent milk, the price differential per point test would be found as follows: 3.5 plus 2.66 equals 6.16; 0.1 divided by 6.16 equals 0.01623; $2.40 multiplied by 0.01623 equals 3.895 cents, which is practically the 3.9 cents as given in the above table.

While only the factor of cost of feed is taken into consideration in the computations resulting in the above table, it is assumed that the other costs of milk production for labor, return on investment, etc., are practically the same for high or low testing cows. We believe this assumption is well taken. It should be understood also that no attempt has been made to compute the cost of producing a hundred pounds of milk. All the table pretends to show is the allowance per point test that should be made to equalize the cost of producing high and low testing milk after the base price and base fat percentage have been set.

It is interesting to note that not only do the allowances shown per point test do substantial justice on the basis of relative costs of production of various tests, but the investigators also show that the food value of milk when measured by its energy content is subject to the same proportional variations as given in the table. In other words, if the consumer pays at the rate of $3.90 a hundred for 3.5 per cent milk, he can well afford to pay $4.22 a hundred for 4 per cent milk on the basis of its food value as measured by its energy. There is some question as to whether this is the correct measure of food value when energy alone is considered and no consideration is given to the other values of milk, such as protein, minerals, vitamins, etc.

Storing Apples

Kindly inform me regarding the best way of keeping apples over winter. Would you advise pitting?
Detroit, Mich. R. S.

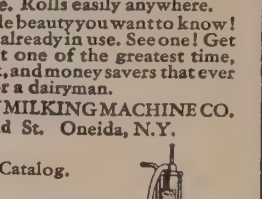
It is difficult to state what is the best method to follow without knowing some of the conditions. Taking it for granted that there is a basement, we would advise against "pitting" as a desirable method of storing fruit. Apples can be kept successfully in pits but they are practically unavailable for use during the winter. A room in the cellar, preferably without a floor, which has an outside window so as to aid in keeping the desired temperature and which can be kept at a temperature of from 32° to 40°, would make it possible to store apples and keep them in first class condition during the entire winter. Sometimes apples in storage in cellars shrivel. This is due to insufficient moisture in the atmosphere. This difficulty is easily overcome by occasionally putting a quantity of water on the floor. If the floor is of earth there will be less difficulty from the insufficient atmospheric moisture than if the floor is of cement or wood. The same method, however, can be used in overcoming the difficulty in either of the conditions.

Another method is to set a tub of water in the fruit cellar. This not only assists in keeping the atmospheric moisture conditions right but also has a tendency to prevent the temperature from falling below the freezing point of the fruit. In cellars in which there is no furnace it may be necessary in very cold weather to take precautions about the temperature falling below the freezing point of the fruit. The temperature can go three or four degrees below the freezing point of water without injury to the fruit. If the temperature is falling too low, one method of preventing the occurrence of injurious temperatures is the use of water as previously suggested. Spraying of water on the floor will also help. A lighted lantern may be used. As a rule, however, this special precaution will not be found necessary in the ordinary cellar.

Dairymen

YOU can *now* get a Hinman Milker in a PORTABLE GAS ENGINE UNIT. Power and milker complete in one compact, simple little machine.

Uses the same Hinman System—*proved right by 19 years of success in every good dairy county!*



Real simplicity that does better work and costs less to buy and operate. Milks three hours on one quart of gas. Takes little space. Rolls easily anywhere.

It's a little beauty you want to know! Hundreds already in use. See one! Get facts about one of the greatest time, hard-work, and money savers that ever worked for a dairyman.

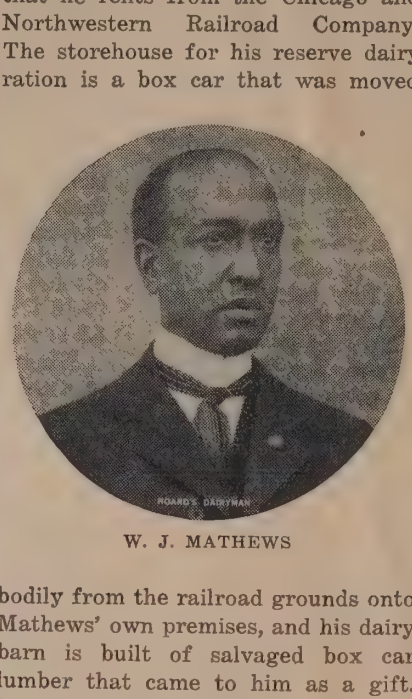
PRATER PULVERIZER CO.
1303 N. Kostner Ave., Chicago

Also makers of Blue Streak Mills, large capacity Hammer Type, moderate speed. Grinds roughage as well as grain—for Fordson or equal power.



Strictly high grade milk wagons, built upon honor and fully guaranteed. Ask for free catalog showing styles for every requirement. Suitable terms and liberal cash discounts. Pioneers in milk wagon building with sanitary bottled milk equipment.

DEKALB WAGON COMPANY
P. O. Box E DEKALB, ILL.

FROM DINING CAR TO DAIRY

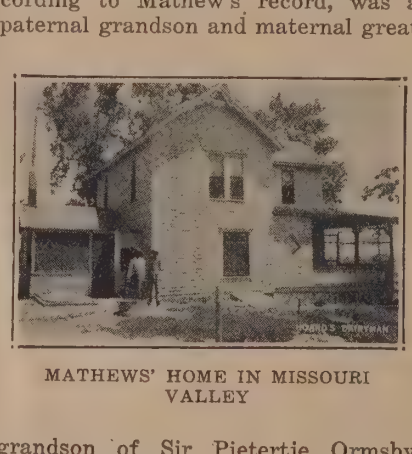
GEORGE R. HARRISON, IOWA

WILLIAM J. Mathews, a colored dairyman of Harrison County, Iowa, pastures pure-bred Holstein cows on bluegrass land that he rents from the Chicago and Northwestern Railroad Company. The storehouse for his reserve dairy ration is a box car that was moved

W. J. MATHEWS

bodily from the railroad grounds onto Mathews' own premises, and his dairy barn is built of salvaged box car lumber that came to him as a gift. Thereby hangs a tale.

In the earlier days Mathews was a dining car waiter for the company working for $25 a month. He was promoted to be a dining car conductor and after a while resigned to become the leading dairyman of Missouri Valley, a railroad junction city of 5000 population. At one time Mathews was milking 30 pure-bred and registered Holsteins while supplying the railroad dining cars and part of the city.



It is remarkable what this man Mathews achieved. He came out of the east where his only environment was that of crowded cities. He had never dreamed of turning dairy farmer for he knew nothing whatever about cows. But he went into the dining car service with a run between Missouri Valley and Sioux City and there saw the difficulty in procuring quality milk and cream for the dining car tables. Then it was that the dreams came. Why couldn't he have some cows of his own and supply milk and cream to his car?

The railroad passed through a district of wonderful fertility but this fertility had scarcely any area devoted to dairying. It was turned almost entirely to raising corn and alfalfa for fat cattle and hogs. Cows kept for milk were common stock. Milk that was delivered to the dining car service would not keep any length of time and it had other faults. Mathews believed that he could overcome these if he had the milk production in his own hands.

He began to seek out men whom he knew to have dairy knowledge. One of these was the head of a creamery company in Sioux City. From this man he obtained much valuable information. His advisor told him where to get literature on the subject and soon afterwards Mathews became a subscriber to the regular dairy publications. Then one day Mathews bought his first cow, a pure-bred Jersey, for the price of $150, and the man from whom he bought was willing to take his note. The railroad company knew nothing about his venture at that time. Mathews' family was growing so most of the milk from this cow had to remain at home, but it was this first Jersey that gave practice in milking. He had never milked before and neither had his wife, but they soon learned.

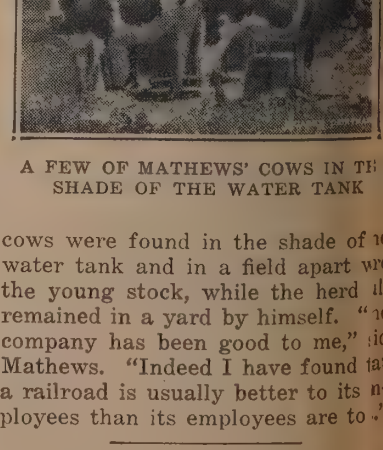
However, this cow did not satisfy Mathews because her volume of production was not up to his expectations so he bought a Holstein, a Mercedes cow, from Charles Holmes of Iowa. Again Mathews was a little disappointed. He had been reading and understood what production ought to be. But a friend who looked over this cow's pedigree advised him to keep her and try the effect of good feeding. So Mathews started a ration of ground hominy, ground alfalfa, and alfalfa hay while having her milked three times a day. She advanced from her daily production of 50 pounds right after freshening, up to 85 pounds a day. Mathews was satisfied at last.

The cow soon paid for herself so he gave his note for more Holsteins from Holmes, and another group of cows was then bought. He bought good bulls. This he said the dairy papers taught him as they had other things. His first herd sire was Hope Cornucopia Johanna Lad the Fifth, and the pedigree, still in Mathews' possession, states that "his ancestry represents the most extraordinary producers of the breed, many of his dams having held world records." A later bull was Sir Henry Ormsby Pontiac who, according to Mathew's record, was a paternal grandson and maternal great

MATHEWS' HOME IN MISSOURI VALLEY

grandson of Sir Pietertje Ormsby Mercedes, famous for the work of his daughter, twelve of them having averaged 1153.83 pounds butter from 25,286.10 pounds milk. And this bull's dam was a paternal granddaughter of King Segis Pontiac, sometimes called the "marvel of all sires" because he had fourteen 1000-pound daughters. That is evidence enough to show that Mathews, the dining car conductor, had learned the lesson of quality in good breeding.

He studied also good methods of feeding and gave his cows the best of care at home. He weighed the milk of every cow quite regularly or, when he had to be on the dining car run, his family did it for him. Mathews at that time had the only real dairy cows around Missouri Valley. He was the first producer there to grind the ration and, so far as known, he was the first dairyman in Harrison County to install a milking machine. That was about 12 years ago and the milker is still operating.



The railroad company was still not aware apparently of their waiter's outside occupation, for Mathews put the milk and cream through a friend in Sioux City and drew his pay through the same indirect course. But one day the purchasing agent for the service entered Mathews' car. "Everything going all right?" he asked, and Mathews' pride could not contain itself. He led the way to the ice box to show some poultry of his own raising and he praised the excellency of the milk and cream that his own Holstein cows had provided. The secret that he revealed bro him a reprimand from the agent the warning that discipline w come from headquarters. Two w afterward the dining car superint ent appeared. "You should not told the purchasing agent anyt about it," he said "but we've g all fixed up. Now go ahead and nish all the good produce you After that Mathews' milk and cr were put directly on the diner Missouri Valley. All the time he selling also to Missouri Valley dents.

Finally the route of the dining was extended to Omaha. This w necessitate Mathews moving his dence if he kept his position on car, so he resigned and went r heavily into the dairy work. W at first the company gave him concession on one car, now it off him concessions on four or Mathews was prospering and for livery in Missouri Valley he was ing a high priced motor truck. believes now that it is not always to show outside signs of prosp because he says it invites too n competition. Others began to attention to dairying of the be sort until now there are eleven da men with milk routes in the little and Mathews' herd, as a result, been reduced to fifteen animals.

But the cows still pay, althoug sells only to the cream market feeds the skimmilk to poultry hogs. He gave up the concession the diners because the company sired more cream than he could ply and they would have this all f one source.

Since Mathews began dairying has paid for a home and several in the city and forty acres of alf land three miles distant. He past his cows on the railroad land, pa a low rental, and has plenty of land for corn crop also. He has one daughter through college in Louis, another is there at preser son is preparing for the higher cation, just having finished school, while four others remain the city schools, the only col children enrolled. Mathews is e worth $10,000.

Down along the Chicago Northwestern tracks some of

A FEW OF MATHEWS' COWS IN TH SHADE OF THE WATER TANK

cows were found in the shade of water tank and in a field apart w the young stock, while the herd remained in a yard by himself. " company has been good to me," Mathews. "Indeed I have found a railroad is usually better to its ployees than its employees are to

Only When Wet

Slater: Does your roof leak w it rains?

ilk Must Be Made Safe

OARD'S DAIRYMAN:—The annual ing of the International Associa- of Dairy and Milk Inspectors in Toronto, Oct. 24—26, brought her public health officials, in- tors, professors, and dairy scien- from the United States to the ber of around 75. In addition a le of dozen Canadians interested ne same line of endeavor swelled total to 100 or over.

ne keynote of the meeting, as one nt expect, was that milk for hu- consumption must be made e" from a health standpoint. Ad- ses and discussions, conclusions experiences bore directly upon big and important question of guarding the milk supply and inating all possibility of disease g communicated to man through most wholesome and valuable of s—milk. The factors empha- l may be summarized as follows: roper pasteurization of milk is ssary to insure its safety from ase.

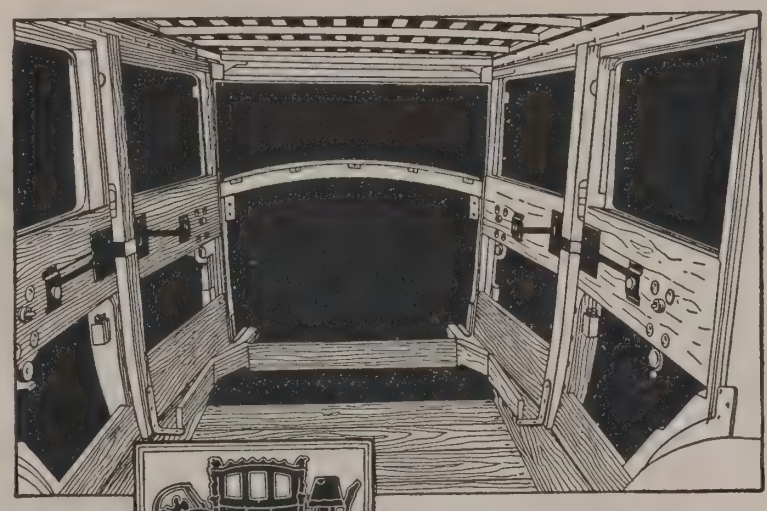
uberculosis-free cows are essential aintaining a healthy milk supply. ecause cows are "tuberculosis- " does not make pasteurization ecessary. It is needed to prevent spread of such diseases as typhoid scarlet fever, septic sore throat, diphtheria.

is more difficult to secure proper eurization of milk in the smaller es than in the larger ones.

he meeting expressed itself in fa- of compulsory pasteurization of for human consumption.

asteurizing appliances should be ked up frequently to prevent laxi- n the operation.

asteurizing or heating the milk its digestive qualities. Only one min is injured by heating to 145 rees for 30 minutes. This injury he milk for children can be obvi- l by adding a little orange juice to child's diet.



Strength plus Resiliency

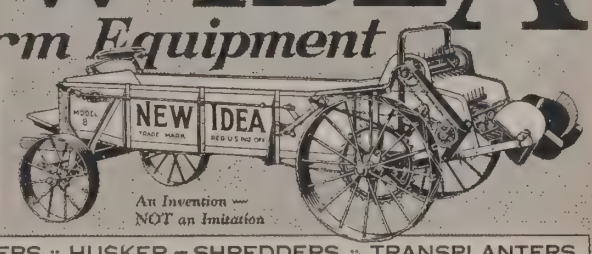
THE framework of all Fisher Bodies—like the framework of all quality bodies without exception—is made of wood, powerfully braced with malleable iron and steel braces.—*To supply Fisher with sufficient lumber for body manufacture, approximately 160 acres of timber land, equal to a quarter-section*—most of it hardwood—are cleared every working day.—The framework consists of a strong foundation and a super-structure. Wood is necessary, because it is the only material which combines the necessary *resiliency* with the necessary *strength*. Resiliency is necessary, because an automobile body is subjected to road shocks, strains and stresses. Wood, and wood only, will stand up satisfactorily. Wood, and only wood, will deaden the noise and absorb the shocks. There are no stronger bodies built than those which Fisher builds—and none which stand up better or longer.

* * *

Composite Construction—All Fisher Bodies are of composite wood and steel construction, which affords flexibility, durability and greater strength. The wood reinforces the steel and the steel reinforces the wood.

Lumber—The lumber for Fisher Bodies is carefully selected and seasoned, and subjected to many close inspections, both before and after being cut for building into a body.

A Fisher Body framework from the interior. Note the sturdy construction, in which the finest of hardwoods are used.



Body by FISHER

Certified milk produced in strict accordance with the regulation governing its production is safe, though there was a hint or two from some of the members that even milk marketed as certified should be pasteurized. It developed in the discussion on this question that a very great deal of the milk marketed as "certified" is produced under somewhat lax regulations in many places. Hence the need for pasteurization.

In many eastern centers at certain seasons of the year, owing to a scarcity of milk, consumers are dependent upon the concentrated product. Hence the recommendation of the meeting that milk for condensing or powder purposes should come under the same regulations as to production that "raw" milk for human consumption does. Here, again, the information was given out that many concerns, more particularly smaller plants, scattered here and there all over the country, did not produce condensed or powdered milk under satisfactory conditions, considered from a public health standpoint.

NEW IDEA
Farm Equipment

For nearly thirty years the undisputed leader! The original and genuine wide-spreading spreader. Sales and service everywhere. Write for catalog.

An Invention — NOT an Imitation

MANURE SPREADERS :: HUSKER-SHREDDERS :: TRANSPLANTERS
THE NEW IDEA SPREADER COMPANY, Est. 1899 Coldwater, Ohio, U. S. A.
BRANCHES: Harrisburg, Pa., Syracuse, N. Y., Columbus, O., Indianapolis, Ind., Madison, Wis., Jackson, Mich., Minneapolis, Minn., Omaha, Neb., Kansas City, Mo., Moline, Ill., Nashville, Tenn., Oakland, Cal.

The use of chlorine compounds in water for cleaning dairy utensils of all kinds was recommended as being more effective than hot water or even steam, especially on dairy farms where hot water, and more particularly steam, is not always available.

Where milk is pasteurized and marketed under well regulated sanitary and other conditions, the producer receives a larger return for his product than where no such regulations exist.

In that part of the United States east of Pittsburg the population of cities and towns is increasing at the rate of one million annually, without any corresponding increase in the number of cows to supply milk for human consumption. Professor Ira V. Hiscock, New Haven, Conn., was elected president and Ivan C. Weld, Washington, D. C., was elected secretary.

Dec. 1—Annual meeting National Dairy Council, Palmer House, Chicago, Ill.

Jan. 17, 1928—Annual convention of The Milk Council, Inc., 228 No. La Salle St., Chicago, Ill. Secretary M. O. Maughan.

Correction

In reporting the National Dairy Show at Memphis in the November 10 issue we said that Iowa State College won the college students' judging contest at both the Waterloo Dairy Cattle Congress and the National Dairy Show last year. The statement is inaccurate. Iowa State won both contests two years ago and not last year.

Brown (gazing for first time at city's heavy traffic)—"Jee-rusalem, Hiram, they sure are back with their hauling, ain't they?"—Wall Street Journal.

Breeders of Brown Swiss Cattle Hold Annual Meeting

The annual meeting of the Brown Swiss Cattle Breeders' Association of America was held at Beloit, Wis., November 3, 1927.

According to the report of Ira Inman, secretary, the following registrations and transfers for the fiscal year were made: Bulls registered during the year, 1,777; cows registered during the year, 2,589; total number of registrations, 4,366; bulls tranferred during the year, 2,017; cows transferred during the year, 2,290; total number of transfers, 4,307; new members received, 78; cows entered on test during the year, 124; cows qualifying during the year, 66; cows now on test, 102.

At a meeting of the Board of Directors the following motion was offered by J. Frank Zoller and passed that all Brown Swiss animals to be exhibited at fairs where Brown Swiss specials are given, with the exception of calf club calves, must be tattooed and certificates of registry, accompanied by tattoo numbers, must be sent to the office of the secretary of the Brown Swiss Cattle Breeders' Association before being exhibited.

Franklin Invented Rods

Wise Benjamin Franklin wrote to two of his friends of the Royal Society of London in 1750, and suggested that damage by lightning to buildings and other objects upon the surface of the earth might be prevented by the erection upon their summits of sharp

A barn protected against lightning, weather, and fire not only with sheet steel roofs well grounded but added "points" on the ridge of the roof and on the ventilator.

pointed iron rods, the lower ends of which should be extended into the ground.

Two years later, in 1752, Franklin performed his well known kite experiment. In the summer of 1753, three years after he wrote his London friends, he put up on his home the first lightning rod ever erected. Franklin's confidence in the protection of his lightning rod was such that he persuaded several of his friends to allow him to erect similar rods on their houses that he might have a better opportunity to observe their effects.

Thoroughgoing and methodical as he was, Franklin left an account of his observations in what now seems quaint language. Luckily for mankind it was the silent discharge or "brush lightning" that lighted up his staircase "as with sunshine so that one might see to pick up a pin." Had a heavy bolt come down his rod, these observations from Franklin's work might not have been written:

"In Philadelphia I had a rod fixed to the top of my chimney and extending about 9 feet (2.74 m) above it. From the foot of this rod a wire (the thickness of a goose quill) came through a covered glass tube in the roof and down through the well of the staircase; the lower end connected with the iron spear of a pump. On the staircase opposite my chamber door the wire was divided; the ends separated about 6 inches (15.25 cm) a little bell on each end; and between the bells a little brass ball suspended by a silk thread, to play between and strike the bells when clouds passed with electricity in them. After having drawn sparks and charged bottles from the bell of the upper wire I was one night awakened by loud cracks from bell to bell, and while the fire passed sometimes in very large quick cracks from bell to bell, and sometimes in a continued dense white stream, seemingly as large as my finger; whereby the whole staircase was enlightened as with sunshine, so that one might see to pick up a pin."

Some folks in France, England, and America were kindly disposed to Franklin's new device, but the Royal Society of London looked upon it coldly and many religious orders in these countries regarded Franklin as an infidel proposing to interfere with a divine instrument for the punishment of sinners. During the same time, the ringing of bells was recommended by some of the clergy as helpful to breaking up thunderstorms and warding off lightning strokes. In many instances progressive folks who had erected lightning rods were to have them torn down later by their angry neighbors, imagining the rods responsible for crop failures, earthquakes and other evidences of what seemed to them to be divine displeasure.

Franklin invented the lightning rod 175 years ago. It took a century for the superstitions held by civilized people to die down. Then people swung the other way, becoming credulous and looking upon lightning protection as something magical, knowledge of which was held by a favored few. So came the "lightning rod man," a synonym for "swindler," to prey upon this credulity. His fraudulent operations gave rise to a deep prejudice of 40 years' standing.

It is also worth recalling that Benjamin Franklin, early in the year of his famous kite experiment when he proved the similarity between electricity and lightning, called together a group of prominent Philadelphians and organized the first fire insurance company of America. It has a long, quaint name implying care and plenty of time to write it in those early days. Its official name is the "Philadelphia Contributionship for the Insurance of Houses from Loss by Fire." It has come to be known as the Philadelphia Contributionship and is for the benefit of all the contributors or members. It is a mutual company writing perpetual policies.—DR. C. E. DRAYER, Sheet Steel Trade Extension Committee.

Do Dairymen Study?

Over two million people, young and old, in the United States studied correspondence courses at home last year. Investigation shows that the majority of these people live in the rural communities and small towns. Statistics also show that each succeeding year more and more people select suitable correspondence courses for systematic home-study during their spare moments. It is also a known fact that these self-educated people succeed where others fail.

With that in mind, the North Dakota State College at Fargo has been offering, during the past two years, a number of practical farm courses by mail. This service has proven so popular and successful that the college has started out on its third year of this work with new subjects as well as the original courses which have been revised and enlarged.

Two courses in dairying will be available this year. Due to the unusual popularity of these two subjects, special preparation is being made at the state institution to take care of the large anticipated enrolln Last year people from all over United States took advantage of special service and almost ever who completed either one of the ry courses has enrolled in ano course. Those former students the best boosters. They write to t friends who live even in other st recommending these subjects their spare time in winter.

These courses are free except fo cost of the postage and paper u Each course is divided into twelve signments including explanations questions. Free state and fed bulletins are used for text bo Students are required to answer q tions in writing. Upon completio a course a Certificate of Comple is awarded.

Further information regarding service and different courses off may be obtained by writing to Department of Correspond Courses, State College Station, F go, N. D.—T. W. THORDARSON, rector.

The First Cattle in Amer

HOARD'S DAIRYMAN:—I read some interest the report of an add delivered by Colonel R. M. Little Iowa, which appears in your issu February 25 entitled "The First tle in America."

It is not clear whether Col Littler in using the term "Amer includes the whole continent of N America or only that lesser part occupied by the United States. means the United States terri only, what he says about the firs troduction of cattle is probably rect, although I wonder if he is q sure that none of the cattle brou to this side of the Atlantic by Spaniards did not precede the c brought to Virginia. On the o hand, if Colonel Littler meant continent of North America, I t the liberty of pointing out that first cattle were brought to Port R al, now Annapolis, Nova Scotia 1606. The post was established De Monts in 1604 but in 1606 P rincourt brought the first cows to settlement. This was probably n permanent introduction because settlement was destroyed by an pedition from Virginia, under Ar in 1613, and if these pirates spa any of the cattle the Indians in probability did not overlook th That being so, the first permanent troduction of cows into Canada made by Champlain at Quebec 1608 or 1609. It is from these tle, supplemented by a further portation in 1660, that the registe pure-bred French-Canadian cow descended.

Canada. J. A. RUDDICK

Short Courses in Dairy Manufacturing

Four short courses of two we each in dairy manufacturing will be given by the Kansas State Agri tural College, starting January 2 These courses will be of special in est to ice cream makers, butterm ers, milk plant operators, and oth connected with plants which ma facture dairy products.

Anyone desiring further infor tion in reference to the courses shou write to the Department of Da Husbandry, Kansas State Agric tural College, Manhattan, Kansas.

Dorothy: "Mamma, why hasn't pa any hair?"

Mother: "Because he thinks so much, dear."

Dorothy: "Why have you so mu mamma?"

Mother: "Because—go away and your lessons!"

Wheel it in and Start Milking

No Installation—No Pipelines—No Pulsators
No Vacuum Tanks—No Complex Teat Cups
No Valves—No Separate Pails

Mr. Dairyman! *You can't imagine* what this simple, *easily cleaned* milker will mean to you until you've used it on *your* cows. The free trial will convince you. And that awful milking problem is solved. DON'T MISS THIS chance for a free trial *while this offer lasts.*

Read what Chas. H. Lien, R. No. 3, St. Cloud, Minn. says:—"The Page is easier on the cows than hand milking and gets much cleaner milk. It is a wonderful machine, simple in construction, and easy to operate. The page will do anything any milking machine will do and it costs a great deal less." And Mr. Henry Kosab, Fairmont, Minn., writes us:—"The Page Gas Milker is cheap to operate. It cleans itself after each milking. It is the most sanitary machine and it is easy on cows. I will never go back to hand milking again."

Arnold Boiwahn, R. No. 3, Box 6, Norwalk, Wis. says: "The Page is sure easy to operate. The cows like it better than hand milking."

s Engine,
ectric or
and Power

No C. O. D. to Us

At Last!

he milking machine problem has been ved—yes, *solved!*—and we'll prove it to ir entire satisfaction on YOUR OWN va, in your own barn, *before you pay us cent.* And, *if* you are not more than sat- ed, you just send the milker back at *our ense.* But we know you, like other dairy- n using this great milker, will be DE- GHTED and we back this machine with *10 YEAR GUARANTEE.*

lo Installation

t wheel any model—gas, electric or hand wer—into your barn and start milking. THING TO INSTALL. No pipelines, tanks. It's all in one handy, compact unit n wheels. Comes complete—ready to use.

nd It's So Simple

A Vest Pocket Herd Book is a good investment

Seasonable Live Stock Note

INQUIRIES on feeding cows have been coming in in increasing numbers by which we know that field activities have been put away for the winter. Dairymen do not, as a rule, take time to seek information about feeding live stock when there is a rush to plant, cultivate, or harvest crops. Furthermore, pasture grass, when abundant and succulent, compensates for the deficiencies in other feeds much as does milk in human nutrition. There is, therefore, as a rule, less need during the summer for dairymen to be concerned about having their rations just right though by no means do we imply that there are no feeding problems during the summer.

Regularity Helps Fill the Milk Pail

An inquiry from a southern subscriber has suggested an important part of good cow management. This dairyman found it necessary to move his cows to makeshift quarters under none too good weather conditions while a barn was being repaired. The cows dropped quite noticeably in production. Preceding this, however, they had experienced a shortage of feed due to drought and this had a part in reducing their production. The owner set about to repair the damage but was not able to bring them back fully to their previous production even though he improved both the quality and quantity of their rations. Cows respond to regularity in housing and feeding and he who violates this part of their management must expect to subtract the consequences from what might have been satisfactory.

Look Well to Quality of Roughage

Milk production is cheapest when capable cows consume large quantities of good roughage properly supplemented with the right amount and quality of concentrates. Not all roughage is good enough, however, to tempt cows to eat their fill of it in which circumstance production if maintained is more at the expense of the higher priced concentrates. To avoid this it is necessary to know when cows are letting down on the amount of roughage consumed as also how to improve the palatable character of such feed. One way to maintain normal consumption of roughage is to offer a variety of it. Failing in variety one can frequently make roughage acceptable to cows by cutting or grinding it and mixing in some feeding molasses.

Warm Up the Tank Heaters

It is a time of year when more than casual attention should be given to the water offered cows. Milk is approximately 87 per cent water which comes from the feed and from the drinking water. To produce large quantities of milk cows must drink large quantities of water as well as eat large quantities of feed. We sometimes pay so much attention to the feed that we forget the water. The vendor of ice cream and soft drinks at a fair fears a cold turn of the weather more than anything else which is another way of saying that hot drinks go better in cold weather and cold drinks go better in hot weather. Why give the dairy cow a cold place to drink ice water?

Feeding the Self-feeder

The self-feeder is a fine piece of equipment in the hog lot but it is not automatic in its service. Of greatest importance in their operation are that they must be supplied with feed and they must be kept free from anything that hinders their operation. The coming of cold weather has a tendency to clog the feeders more than in warm weather. Mud, snow, sleet, and rain followed by low temperature may more or less stop the of feed. Furthermore, 'tis very hu to shun filling the feeders when ten or fifteen below.

Protect Pregnant Sows

A common mistake in the man ment of pregnant sows is to a them to run with that part of herd being fattened for market. things occur under such circ stance that are not to the best in ests of the future generation of In the first place, the ration for tening hogs is not the best one pregnant sows in addition to w the sows become too fat; in the se place, the fat hogs have a habi piling up at night, a thing not so for pregnant sows.

Inspect the Ventilators

In our efforts to keep pigs warm must not forget the importance good air and the conditions that fect its supply. We are reminde an experience related by a speci in swine disease control work was called hastily by a farmer to him discover what had caused a den over-night death of what had parently been healthy hogs the previous. The mortality was h the owner could think of nothing poison. The specialist got all facts together and from them fin convinced the owner that his l had died of suffocation brought al by the piling of hogs on a cold, night in a hog house that was cl too tightly the previous evening. is an extreme case; we use it posely to drive home the import of ventilation in hog houses.

A Cheap Source of Protein

In wintering the breeding her cheap source of protein is desir The feeding of alfalfa or clover not only materially lowers the cost but it also keeps the sows in breeding condition. The use of h hay compels the sows to stay on t feet longer than they would if fe exclusive grain ration. In additio the hay, from one to one and half pounds of grain should be for each 100 pounds live weight.

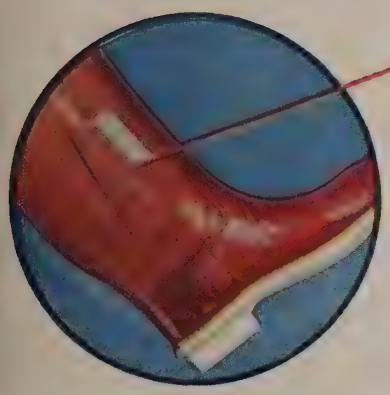
Profitable Market Weight

Consumers do not want heavy fat cuts of pork. It is unwise to duce and offer for sale a food pro not in keen demand by consumers reasonable degree of finish is ne sary to make a firm carcass and atable meat but it is a poor polic feed hogs to the finish demanded or fifteen years ago. All of w has an economic bearing on h weight at which hogs are most p itably marketed. With the tren consumer demand, there is more profit in marketing hogs at wei between 175 and 210 lbs. than heavier weights.

Some Chickens Do Not Choose to Roost in the Chicken House

The writer well remembers an nual event of his boyhood days. came usually in November and prompted by the first cold snap the season. It consisted in gathe up all the chickens that did choose to roost in the building called a chicken house and pla them therein. Along in March we a few eggs and by April all the were cackling but the price was d to 15 cents a dozen or thereabou

There are more good poultry hou now than then but we doubt if ch ens have learned to come out of trees of their own accord. This late reminder that winter eggs for higher prices if one has the e It is November. The cold side tree is not a good hen roost.



In the dairy barn—*and everywhere the farm job takes you—these "U.S." Blue Ribbon boots will keep you dry-shod and comfortable. And they are as husky as they look!*

Farm tested . .

This "U.S." Blue Ribbon Boot *stands the hardest wear . .*

"U.S." Blue Ribbon Boots
come in red or black—sturdy gray soles—knee to hip lengths

Stretches five times its length!

If you cut a strip of rubber from a "U.S." Blue Ribbon boot or overshoe—you'd find it would stretch more than 5 times its length! This rubber stays flexible and waterproof—long after ordinary rubber would crack or break

75 YEARS of experience in boot-making by the largest rubber manufacturer in the world—that goes into every "U.S." Blue Ribbon boot. This boot is *built* to stand every farm test.

It's just as husky as it looks—extra strong, every inch of it. You can't kick through that thick, oversize sole—it's as tough as the tread of a tire.

And the uppers — they are made of the finest rubber — rubber so elastic that you can stretch a strip of it more than five times its own length! No wonder, where inferior rubber splits and cracks, "U.S." Blue Ribbon boots stand up!

And at every vital point where wear is hardest, from 4 to 11 separate layers of tough rubber and fabric are anchored in behind that strong surface—to give *extra* strength. Only "U.S." Blue Ribbon boots and overshoes have so many!

* * *

We know you will like the plus farm value in "U.S." Blue Ribbon boots and overshoes.

Every pair is built by master workmen—and built *right*. They fit better, look better, wear better. Get a pair and notice the difference.

United States Rubber Company

The "U.S." Blue Ribbon Walrus
slips right on over your shoes. Its smooth rubber surface washes clean like a boot. Made either red or black—4 or 5 buckles

ATWATER KENT RADIO

Let's go to the city tonight

WE ALL need a change. Let's go to the city tonight. We'll listen to the dinner music at a big hotel; then a concert for a while. A violinist who makes a fortune every time he appears will play for us. A male quartet will sing the songs of long ago.

An adventurer, just back from strange lands. A comedian with some new jokes. The new fashions reported for women. Dance music for those who like it—

Pretty expensive, if the family actually did go. But think of it! Just a half-turn of the Atwater Kent ONE Dial brings your choice of the worth-while diversions of the great cities—right in your own comfortable home, with your own comfortable bed awaiting you when you've had enough.

Things to amuse when you're tired, to soothe if you're out of sorts, to help you in your work, to keep youngsters happy at home and the old folks entertained.

Why is it that almost every good dealer advises you to buy Atwater Kent Radio? He could make more money on others. He could tempt you with lower prices. He could sell you sets costing three or four times as much.

But he knows that Atwater Kent Radio will give you *everything* and will never fail you. He knows you will be *satisfied*—as more than a million Atwater Kent owners have been satisfied.

ATWATER KENT MANUFACTURING COMPANY, *A. Atwater Kent, President*

MODEL 33, six-tube, ONE Dial Receiver. Antenna adjustment device. Unusual selectivity. Solid mahogany cabinet; gold name plate, power supply switch and vernier knob. $90

MILK STOOL PHILOSOPHY

J. J. SPRENGER, MINNESOTA

OME one jokingly said that farmers are like hens in that they are always scratching and working get a full crop. While this is some- it of a play on words, yet it sug- ts a thought well worth consider-

here is a universal longing for a onse and remuneration for work hfully performed and since our k, as farmers, is remunerated di- ly by nature, with mostly but one season in the year, we have been n a special kind of a hope borne expectation and zeal to carry us ugh the lean parts of the year. are buoyed and spurred on during rge part of the time by this hope, realization of which seems within very grasp, and produces a fasci- ion the like of which only a farm- can know. It gets us up early in morning and keeps us at our task the night, yet makes us happy in expectation of that bountiful crop. ut so seldom in life do the things actually realize and the things we estly feel that we have a right to ect, harmonize. For this reason we n have the blues just at the time n nature has planned to make it time of rejoicing. This has ever n so. The writer can well remem- those old days when these things e first brought home to him. In se days folks had the foolish (?) a that boys should be brought up work and so no matter how young were and no matter if the boys in cities were going to school, our es in the fall of the year were h the old horse-power threshing hine, the hum of which could be rd for miles in the early morning a time much earlier than the ris- generation likes to rise.

ut we boys were there and our rs as well, because we all helped ghbors thresh, expecting help in rn, and what was more we were always given the easiest (?) job which was keeping the straw away from the little stub of a straw carrier where the dirt and dust like huge clouds of smoke were thrown in for good measure. There we would work while the sweat and sometimes the tears made furrows down our grimy faces, and yet those things did not hurt us but some of the things said by our elders down on the stacks did.

You see every time the machine would have to stop to repair a belt or so, someone generally called out to the farmer for whom we were threshing, "Well, Jim, are you finding out how rich you are?" to which we would hear the answer that farming was a regular dog's life, that he would get about enough to pay interest and taxes and if there was any left the hired man would get the rest.

Usually we boys said nothing but we thought a lot, and then we would envy the one of our boy friends who could go away to school in the big city so he could get a city job where they got big pay and little work.

But the outcome of all this was so different from what we expected. Every one of these grumblers gradually became the owner of a splendid farm with stock and equipment. Each had a nice home to live in and out of these homes there came forth boys and girls which were a credit to any community, while our boy friend of whom we were so envious never became the owner of even the roof over his head, never had a loving family to be proud of. I asked him once when I was visiting him, "Why don't you get married and have something to live for?" (You see out in God's country we were accustomed to think that when we got married that was the end of our troubles) and they generally did end, only I don't know which end. Our friend could see only the wrong end and could not appreciate the blessings of family life.

ie Milk Council Organized

he Milk Council, Inc., is now existence. Offices have been ned in the Builders' Building, cker Drive at La Salle Street, cago, Illinois, and work is already er way.

rganized for education and re- rch, and also for the promotion of roved trade practices, The Milk ncil undoubtedly has a bright fu- . There is a big field ahead for cational work, for the public does half realize the great food and lth value of milk.

he Chicago milk dealers are back- The Milk Council, Inc., and work already commenced in Chicago.

he president of The Milk Council, ., is Dr. F. D. Walmsley, vice-pres- t of Borden's Farm Products npany. The chairman of the board Vm. Wanzer. Other important of- rs include F. H. Kullman, presi- t of the International Association of Milk Dealers; Chas. The Milk Council, Inc., has secured the services of M. O. Maughan, for the past eight years secretary of the National Dairy Council and well known to our many readers and to the entire dairy industry. Mr. Maughan will serve as executive secretary and will devote his entire time to this important work.

Farm Relief

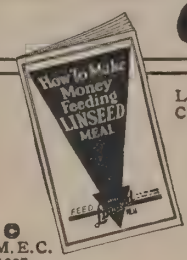
The average farmer of today has at his disposal two really dependable sources of farm relief. These are economical production and orderly marketing. A great many men will go broke waiting for farm relief legislation and many others will make the mistake of depending entirely on cooperative marketing to make them prosper when their surest relief is through cutting their cost of production. One of the chief reasons that this is their surest relief is because the cost of production problem is one that the individual man can tackle right on his own farm; whereas the other methods depend on the action of farm leaders and on farmers in general.

Wisconsin. E. V. RYALL.

Uncle Ab says that most farmers lose more from their own carelessness and neglect than they do from poor markets.

How many Cows do You Need

— to make a good living?



That's a live question today. And more than ever before, the answer depends on feeding for highest profits *per head.*

A dairyman in Jones County, Iowa, cut his herd from 20 cows to 13 and made 50% more money the third year! You too can make more money with less work and worry, by following modern feeding methods. Improve your stock — but first learn how to feed better animals profitably. Mail the coupon for big free booklet containing practical, tested rations for dairy cows and other farm animals.

weight protection

for every farm

Arrow-tip Beam won't bend

Easy-reading Poise casts no shadow

Remember, a good way to lose the profit on a transaction is to guess at weight. A good way to protect your profit and yourself is to know correct value by proper weighing. The Fairbanks Portable Platform Scale helps you do this. This low-cost scale gives every farm the necessary weight protection.

With a Fairbanks Portable Scale you can check the weight of everything you buy and sell—feed your stock properly weighed rations — mix your fertilizers accurately. A hundred times a week you will find use for this handy scale —and you will stop little losses that on so many farms quickly mount up to big sums.

Big production and Fairbanks manufacturing facilities make the price of this high quality scale remarkably low. Scale has the latest refinements, including Arrow-tip Beam, Easy-reading Poise, all vital parts Parkerized, and rustproof, lifetime accuracy. See the Fairbanks Portable Platform Scale, Fairbanks' greatest scale value, at your dealer's.

The Church Supper

The men like to make fun of our church suppers. They say, "What's the use in working yourselves to death cooking and fixing? You never make anything at it. Why, if you would just count the cost of what you women take over there to the church and give that much in cash you would be money ahead and save all that work." And so on, they go—and they are about right, too. But where's the fun in life if we get too sensible and practical? Church suppers are a lot of fun and if everyone will turn out and help they can be made as good as a party. There is something so lively about all the bustle of getting ready and so heartening about the smell of the food that no wonder the men like to go. And they do go. No matter how they talk you couldn't keep them away.

I've helped at many and many a church supper and if you live in a community where you have a large variety of "customers" I believe about the best thing you can do is take some popular dish and standardize it and make it so good that everyone will look forward to having it at every one of your church suppers.

One church I know of specializes in chicken pie; a woman in the church knows how to make the crust so that it is just about perfect and she never fails with it. People come for miles around just to get that pie. Another church has a standard cold slaw; it is shaved fine on a kraut knife and is seasoned marvelously with sour cream, onion, pimento, and celery. The supper this church likes best to serve is Virginia baked ham, scalloped potatoes, slaw, rolls, coffee, and apple pie. When they feel especially gay they put a little ice cream on top of the pie. Sometimes they have meat loaf in place of the ham and they find this about the most practical and easiest to serve of any meat they can have.

I agree with the men. When you consider the women's time and labor and what they contribute in food, there is probably no sound economy in the church supper, but ignoring these, as most churches do, it is a pretty good way to get some cash in the treasury because there is fun along with the work.—LUCY THOMPSON.

Eat a Good Breakfast

"Start the day right. Eat a good breakfast." So read the slogan over the home economics booth of the University of Wisconsin at the 1927 Wisconsin State Fair. The booth went on to explain and demonstrate that a good breakfast *builds* healthy teeth and bones, strong muscles, healthy nerves, red blood, healthy tissues and *insures* strength, growth, and health.

What is a good breakfast for a boy or girl? The following were shown as examples of this: (1) Shredded wheat biscuit with fresh peaches, whole milk, and sugar; graham bread and butter, a soft cooked egg, and milk to drink. (2) Prunes, dark farina with whole milk and sugar, bran date muffins and butter, a scrambled egg, cocoa.

What is a good breakfast for a pre-school child? Orange juice, oatmeal, with egg yolk and raisins cooked in milk and served with sugar and whole milk, white bread toast, and a glass of warm milk.

Avis June Mayer, daughter of Professor and Mrs. Mayer of Purdue University, receiving her daily bath. Mrs. Mayer uses her kitchen tea cart for the table and it is easily moved about into the warmest room and the warmest corner of the room while baby receives her bath. When not in use this cart can be folded into a small package and stored away in a small space. It is covered with baked enamel so that water does not hurt it.

Superstition

When I had threshers a friend of mine from the city helped me. I asked my husband how many men there would be for dinner and he, counting them up, replied, "Thirteen." So I set my table accordingly. When my friend found out the number of places that were laid she was very much distressed. She insisted that it would never do for thirteen to sit down at the table at once; I must either lay another place and sit down with them or put part of them at another small table. I thought at first she was only joking and treated the subject likewise, but I soon found that she was very much in earnest. To her mind it was inviting some very dire calamity down on the heads of my thirteen innocent men if I sat them all down at once at one table. She said it might not happen while they were eating but something would happen to one of them before long. Now this friend is a woman of good education, intelligence, and breeding, and yet she absolutely believed in this old superstition.

I said to her, "Now listen to me. Just who or what could bring about this calamity?" Well, she really did not know but it would happen anyway. Then I said, "In my mind and belief the only thing or being that could cause such a thing to happen is the Lord. And I am equally certain that it makes no difference to Him whether twelve or thirteen or a hundred people all sit down at one table to eat. In fact, it seems almost an insult to Him to even consider that He might sink so low as to visit His wrath upon someone merely because thirteen sat down together. I think the Lord has something else to do than count the number at a table and take exception to the same." She agreed with me, but still thought I'd better set another table for part of them. At this juncture my husband appeared and said that one man had failed to arrive and so there would only be twelve, which quite relieved my friend.

Recently another friend said to me, "My little girl has had two of the narrowest escapes in accidents. The first one, she was run over by a car and not hurt, and now today she fell between the wheels of a wagon and was only scratched a little. But I am worried nearly to death wondering what the third accident will be. You know they always say three things of that sort run together, and three times and out."

"Well, for goodness sake," I replied. "You are searching for trouble. Why, you are looking at the wrong side of that problem entirely. Instead of worrying about her next accident, you ought to be concentrating upon how lucky she has been in the last two. That child must be born lucky." I knew this would relieve her.

And she replied, "Why I never thought of that, I guess you are right."

Another lady whom I know persists in worrying over every bad dream that she has, and insists that harm has fallen to whomever she has dreamed of.

Why, oh, why, will people in this day and age of enlightenment, education, and broad thinking stick to these relics of the dark ages and persist in believing that if they walk under a ladder, or break a mirror, or see a black cat in their path it will bring them seven years of bad luck? They are living lives of dread, and are fettered by fear. The tragic part is not what they themselves are bringing upon themselves by worry, but what they are fastening upon their children in teaching them these same ignorant superstitions. They can never do their children more harm than this, and once established it is something that will not be easily erased. If anyone should have had good luck from superstitions I should have had the summer that I found 147 four-leaf clovers, but instead bad luck seemed to hound me the whole year.

I have a poem framed on "Luck" by Max O'Rell and hanging over my desk; these are the words:

"Luck means rising at six o'clock in the morning.
Living on a dollar a day if you earn two.
Minding your own business and not meddling with other people's.
Luck means appointments you have never failed to keep,
The trains you have never failed to catch.
Luck means trusting in God and your own resources."

Superstitions may be all well and good for Hallowe'en and the Yuletide and certainly do add much to the

(Continued on next page)

Send for Our Fall and Winter Fashion Magazine

You simply must have a copy of our Fall and Winter Fashion Magazine, for it contains too many good things for you to miss. All the new fall and early winter styles of course, and then there are pages of novelties for the masquerade. Articles about health and beauty and reducing safely, and pages showing correct hats, fancy needle work, special lingerie, etc.

While you have the matter in mind send 10c for your copy to our Fashion Department, Ft. Atkinson, Wis.

Miscellaneous Fashions

No. 902—Grace and Dignity. Pattern in sizes 36, 38, 40, 42, 44, 46, 48, and 50 inches bust measure. The 36-inch size requires 4 yards of 54-inch material with ⅜ yard of 6 inch contrasting.

No. 906—One-Piece Dress. Pattern in sizes 16, 18, 20 years, 36, 38, 40, 42, 44, and 46 inches bust measure. The 36-inch size requires 2⅞ yards of 40-inch material with ½ yard of 40-inch black and ¼ yard of white contrasting material.

No. 912—For Classroom. Pattern in sizes 8, 10, 12, and 14 years. The 8-year size requires 1⅞ yards of 40-inch material with ½ yard of 36-inch contrasting.

No. 3182—For Classroom. Pattern in sizes 6, 8, 10, 12, and 14 years. The 8-year size requires 2 yards of 40-inch material with 1¾ yards of binding.

No. 3189—Youthful Afternoon Mode. Pattern in sizes 16, 18 years, 36, 38, 40, 42, 44 inches bust measure. The 36-inch size requires 2⅞ yards of 40-inch material with ½ yard of 40-inch contrasting.

No. 3195—Printed Velvet. Pattern in sizes 16, 18 years, 36, 38, 40, and 42 inches bust measure. The 36-inch size requires 3½ yards of 40-inch material with ⅝ yard of 40-inch contrasting.

No. 2051—Attractive Apron. Designed in sizes small, medium, and large. The medium size takes 2 yards of 36-inch material.

How to Order Patterns

Enclose 10c in stamps or coins (wrap carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Our patterns are made especially for us by the leading fashion designers of New York City. No stock of patterns is carried in our office and, since all orders are forwarded to the factory, kindly allow a reasonable time for delivery of any pattern you order.

Aunt Ada's axiom: The hardest part of most unpleasant jobs is making up our minds to get at them.

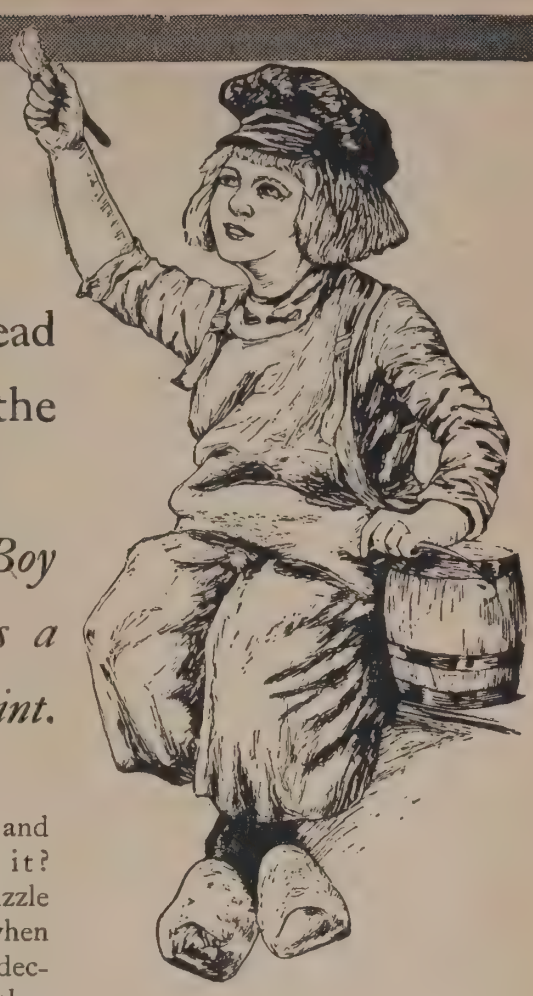
merriment of a party but when it comes to every-day living, superstitions need to be uprooted and their room given to common sense.—ETHEL MORRISON—MARSDEN.

Are You Overworking Your Children?

"James, Mary, Jack, hurry now, get your clothes changed and get at your chores." The boys have the feeding to do, water to pump, swill to carry to the hogs, wood to get,—all these must be done by milking time. They are only eleven and thirteen but they must milk five or six cows every evening besides the other chores, eat their supper, then get their lessons before bedtime. Mary must gather the eggs, feed the hens, help with supper, do the dishes, perhaps sprinkle the clothes before going to her lessons.

Why shouldn't they work and work like beavers nights and mornings and all day Saturday? They go to school all week and sit still most of the time and play the rest, while you are at home hard at work.

Yes, they do just that, but what are they doing while they are sitting in school and we are working? They are working just as hard as we, perhaps harder, yet when night comes we are so tired they must just do the chores and let us rest.



There is a close, indefinable bond between our mind and body. Hard physical labor tires not only our body but also our mind and mental effort fatigues the body as well as the mind. You know if you have spent a day at hard labor, cleaning house, washing, sewing, canning, or gardening, we just simply cannot concentrate, not even on a story. We say we are too tired or too sleepy even to eat. Studying for children tires the mind and it tires the body.

You have heard the expression, "A change of occupation is the best kind of rest." To a certain extent this is true but it must not be carried too far. Fatigue, no matter how caused, —it can be caused even by play you know—produces in the body a fatigue poison which the body readily eliminates if given time but which wreaks permanent injury unless the system has proper rest.

Children should be trained in helpfulness about the home; they should share in the work of the home. It is essential to their education and to the development of character and an appreciation of the benefits of their home. When we give them work to do with these purposes in view we are working for their interests. When we put everything on them we possibly can just to get it done, in an effort to "get ahead," we far too often unknowingly cause them injuries from which they never recover, and the pity of it is that neither we nor they realize it until in later years when it is too late.

When children are in school they use their vitality in two directions. They are studying and they are growing and they must have proper hours of sleep and rest or their health or mental development or perhaps both will suffer. We see a hard working child keep up with his studies but he is weak and aenemic looking, or we see him growing rapidly but not making much progress in his studies.

A child from seven to nine should have eleven hours' sleep; from ten to thirteen, ten hours; and for adolesents, at least nine hours. Are your children getting it? If they cannot do the chores, get their lessons, and get their proper rest, what will you do about it? Do you want the work done badly enough to sacrifice their health or mental development for it?

Any paint beautifies. Lead paint makes the beauty lasting.

Dutch Boy white-lead gives a pure all-lead paint.

WHAT to do and how to do it? These questions puzzle every house-owner when the time comes to redecorate the home, either inside or out. As a starter, send for the "Handbook on Painting" and the booklet (in color) "Decorating the Home." Follow with any specific questions that may be bothering you. We offer the facilities of our Department of Decoration to you. Individual service gladly given.

DUTCH BOY WHITE-LEAD

Frank is having to take his grade over again this year. He declares if he fails he will not go another year. His mother says he has so much work to do that by the time he starts on his lessons his mind is asleep, he doesn't know why he can't get his lessons. Soon his self-confidence will be killed; he will be a "don't care," a "bad boy," or drop out of school, dwarfed and stunted in his mental equipment for life. Who will be to blame? He is a fine, manly chap now, earnestly desirous of keeping up with his class but I have seen others go the way he is headed, ruined just because too much work was put on them during their school days and their parents say, "We just can't understand why Hugh or Elmer should do the way they have; we tried so hard to raise them right."

It is not always the school child of whom too much is expected in home work. The boy or girl who is working in town, teaching, clerking, or doing stenography is often expected to do several hours' work at home. When this is regularly expected and demanded it will overtax their strength and either their work or their health will suffer. The girl who is expected to do the family and ofttimes the neighborhood shopping during her lunch hour or after work needs some consideration but rarely gets it.—GRACE GORDON.

My Way of Cooking Beef Better

I had always hesitated to cook beef as often as pork since it was usually so tough and unpalatable, but since I have learned a new method of cooking I serve beef quite often, knowing that it will be tender and delicious and relished by us all.

In cooking I take each slice and pound thoroughly, incorporating as much flour into the meat as possible. I then place in a skillet containing a little grease, salting and peppering each piece separately and fry until nicely browned on each side. I then pour over it enough sweet milk to entirely cover the meat and place in the oven until all the milk has boiled away and the meat is again frying. Lift the meat and stir in two heaping tablespoons of flour and stir until nicely browned; then add milk, salt, and pepper when I soon have the most delectable, thick gravy which I serve with mashed potatoes.—(MRS.) R. LUCAS.

He Agreed

"Should wives be paid wages?" asks a writer in a recent article in a magazine.

"Certainly!" says a married man of our acquaintance. "What do you think I send my wife out to work for?"—Exc.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

What To Do At Club Meetings

HAVE you ever wondered what you could do at your club meetings to make them interesting, worth while, and different? If you have, then here are some suggestions. On the other hand, you may have had success with other ideas at your meetings that we have not mentioned here. We wish you would tell us about them.

There's nothing better to pep up the bunch than songs and yells. It's usually a good plan to have some singing and yelling right after the meeting is called to order by the president! Does your club have a cheer leader? If not, why not elect one? Have you a song and a yell that's all your own, about your particular club? Why not offer a prize for the best club song and for the best club yell? This prize can come out of the treasury if some kind-hearted person doesn't see fit to offer it. The cheer and song leader should put lots of pep and enthusiasm into his, or her, work. Let's see how loud the club can yell, and how well they can sing. Are the girls better singers than the boys?

Do you review the club emblem at your club meetings? This ritual may be used:

President: We will now review the club emblem. What do the 4-H's represent?

Club answers in unison: The equal training of head, heart, hands, and health.

President: For what is the head trained?

Club: To think, plan, and reason.

President: For what is the heart trained?

Club: To be kind, true, and sympathetic.

President: For what are the hands trained?

Club: To be useful, skillful, and serviceable.

President: For what is the health trained?

Club:—To resist disease, to make for efficiency, and to enjoy life.

How do you answer roll call in your club? Do the members simply say "Here" or Present," and let it go at that? It adds variety and interest to have the club member stand when his or her name is called and make a short report such as "one thing I have learned in club work." A different response can be used at every club meeting. Here are a few ways in which roll call can be answered, and others will probably occur to you: 1, name one great sire of your favorite breed; 2, name one great dam of your favorite breed; 3, the weight of your calf at the beginning of the project; 4, names and records of both sire and dam of your calf; 5, average daily gain in weight of your calf; 6, one health rule I need to observe; 7, what I am feeding my calf; 8, troubles I have had thus far with my project.

After the minutes of the previous meeting have been read by the secretary, the treasurer's report may be given; then comes the regular business session.

A part of every club meeting should be devoted to gaining useful information. Talks, discussions, and demonstrations can be used in presenting subject matter. Here are a few topics. 1, the uses of rope; 2, making a rope halter; 3, feeding and care of the calf; 4, selection of the calf; 5, how I cared for my project—reports by prize winning club members; 6, what an outsider thinks of your club—a talk by a farmer; 7, some common diseases and troubles calf club members should know about; 8, weaning the calf; 9, how to judge a dairy cow; 10, showing the calf; 11, fitting the calf for the show ring.

Have you ever tried outlining the club programs several months in advance? For example, let us take a dairy calf club. We might outline the season's program something like this. First meeting—selecting the dairy calf; second meeting—feeding and care of the dairy calf; third meeting—making a rope halter and leading the calf; fourth meeting—fitting the calf for the show ring; fifth meeting—showmanship or how to show a calf.

Such a schedule might be built up by going into more detail on feeding the cow for production; keeping records on the herd; the value of the pure-bred sire, etc.

Ask me another! Have you played the "question game" at your club meetings? State Club Leader W. P. Mortenson has prepared a set of "yes" and "no" questions for Wyoming club members. Pass the paper and pencils and let's see who scores the highest.

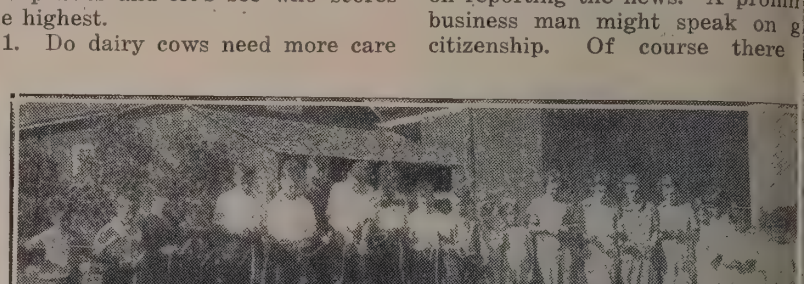
1. Do dairy cows need more care and attention than beef cows? 2. Are there more Ayrshire cows than Holsteins in Wyoming? (Use your own state.) 3. Did the Holstein-Friesian originate in America? 4. Is the Holstein the largest of dairy breeds? 5. Do Jerseys usually have pink muzzles? 6. Should newborn calves have cool milk? 7. Should a young calf be fed once a day only? 8. Is it a good practice to feed the calf from a dirty pail? 9. Should a calf be allowed to eat a little grain as soon as it will take it? 10. Is sunlight good for a young calf? 11. If you were going to show your calf at the fair should you feed it irregularly? 12. Is time spent in teaching a dairy calf to lead wasted? 13. If you want to teach a calf to lead would you start training it before it is 6 months old? 14. Should a calf be brushed? 15. If a calf is washed should it be turned out in the sun and wind right away? 16. When in the show ring should you always stand on the right side of your calf? 17. Is time spent judging dairy cattle wasted? 18. Are small dairy cows preferred?

The question box—do some members of the club have questions to ask, about their projects or about the topic under discussion? Perhaps some of the other members can answer the questions either from experience or knowledge. The leader or some parent may be able to answer if other members can't.

Have you invited outside speakers to your club meetings? One meeting might profitably be devoted to a discussion of finance. Invite a banker to tell you some interesting things about money, wise spending, saving, borr ing, etc. The editor of your l paper might give an interesting on reporting the news. A promir business man might speak on g citizenship. Of course there teachers, clergymen, farmers, pare who could be called on.

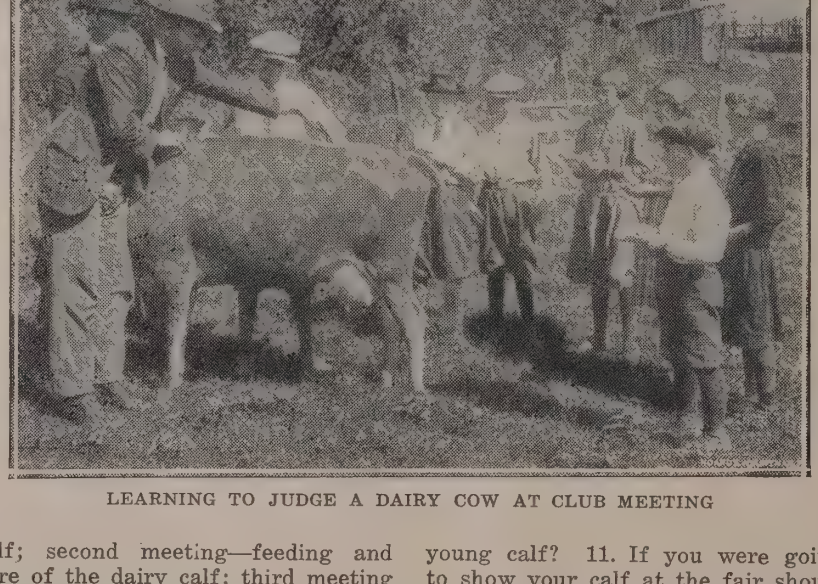
One or more meetings can be voted to history such as the hist of breeds—dairy cattle, pigs, poul sheep, corn, or whatever projects members are conducting. Club m bers can look up their own mate and make reports. The history club work is a topic that might be cussed at one meeting.

Why not have a debate? First a subject, then pick two teams, t pick the judges. Three memb usually constitute a team. You have two on a side or the argume may be carried on by one on e side. It is best to have three juc but you can get along with two or if necessary. Each speaker should allowed ten minutes to present arguments; the affirmative usu speaks first and then alternates the negative in speaking. E speaker should be allowed two m utes for rebuttal after all the speeches have been made. If theri more than one judge, have each vote separately on a slip of pa which team he picks for the winn Some questions which might be bated are:



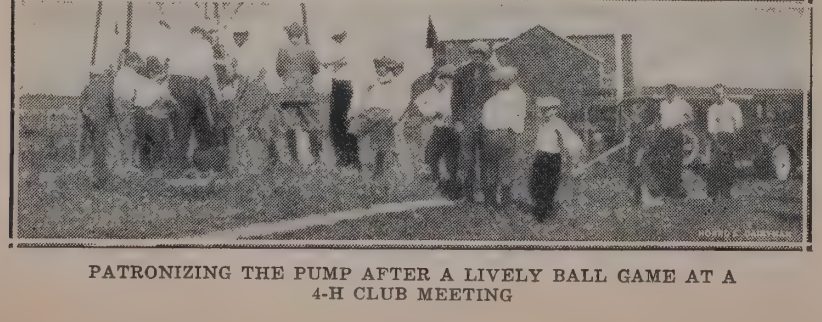
Resolved: 1. That it is more pr able to cultivate a small farm t one of 200 acres or more. 2. That tractor is more valuable on the fa than the horse. 3. That the c stove has done more for man t the plow. (Girls versus boys.) 4. Ta all dairy cattle should be tested tuberculosis. 5. That it is more p fitable to grow legume hay than m legume hay. 6. That diversified fa ing is more profitable than the sin crop system.

One meeting a year can be devc to a tour. The object of this trip is to show how other club members t care of their projects and also to e cate in the better ways of farm This tour may be a local one, visit the homes and projects of sev club members or it may go int neighboring county. Stops at farms of big breeders might be cluded.



A picnic for club members their parents might be arranged one of the summer meetings. Gar and contests make the picnic m lively.

If there is dramatic talent in club, plays can be worked up to vantage.



Holiday programs offer an opp tunity for variation and originali Special programs can be built arou Thanksgiving, Christmas, Linco

CLUB MEMBERS DOING ROPE WORK AT ONE OF THEIR MEETINGS

LEARNING TO JUDGE A DAIRY COW AT CLUB MEETING

PATRONIZING THE PUMP AFTER A LIVELY BALL GAME AT A 4-H CLUB MEETING

thday, Washington's Birthday, bor Day, Fourth of July, Decora- n Day.

Have you ever tried holding joint etings with other clubs? This kes a very good way to get ac- inted and to exchange talent.

he club pledge should be given in son by the members some time ing the club meetings. The nation- 4-H club pledge is: I pledge my d to clearer thinking, my heart to ater loyalty, my hands to larger rice, and my health to better liv- for my club, my community, and country.

o you have a club round-up, or an ievement day in either your com- nity or your county every year? rs set aside for these events play a and important part in club work any districts.

may be possible for you to have ries or lantern slides on some cs in which your club members interested. Perhaps your county nt or the agricultural teacher in a rby high school has a machine for ries and lantern slides and would glad to entertain at one of your meetings. It's worth trying, 't you think?

ow about initiation of new mem- s? That's something else you can t club meetings. There should be erious initiation ceremony as well "stunt." The National Commit- on Boys' and Girls' Club Work prepared an initiation service that good one. This is included in the Handy Book which also gives gs, games, and many worth while suggestions.

Our Review Column

regular feature of the junior department, ewing the contents of Hoard's Dairyman he previous issue. Let's talk it over.]

Did you read Hoard's Dairyman's ort of the National Dairy Show n in Dixie? That was only one he several interesting and instruc- features in the November 10th e.

low does barley compare with n for dairy cows? A feeding trial ently conducted at the Michigan te College demonstrates that bar- may be substituted for corn in the in mixture fed the dairy cow. The position of barley and corn is y similar. Corn is somewhat rich- in fat but there is an advantage crude protein in barley. (See e 1037.)

low does Frank Barfknecht feed c to his calves? This Wisconsin ner feeds about 5 lbs. of whole c a day to his baby calves. The nd two weeks the feed is increased lbs. a day. The third two weeks get half whole milk and half milk. The calves are fed skim- c until a year of age. (See page 8.)

What grain mixture is fed the d? 200 lbs. corn, 200 lbs. oats, lbs. bran, 100 lbs. gluten, 50 lbs. meal fed with first quality alfalfa and plenty of corn silage.

What is needed for successful ning? 1, a farm growing legumes, d pasture, and grains; 2, cows ducing 5,000 lbs. or more of milk; quipment for high quality produc- ; 4, equipment for economical keting. (See page 1040.)

lame some causes of bad flavor odor in milk. 1, poor physical dition of the animal; 2, odors ab- ed after milking; 3, biological nges in the milk; 4, highly flav- l feeds. (See page 1048.)

low can those due to highly flav- l feeds be controlled? Off flavors n feed come through the body of cow and not through the air of milking barn. Milk will be com- atively free from feed flavors if king is done an hour after feeding, especially with the following feeds: corn silage, legume silage, green alfalfa, turnips, and cabbage.

How many herds are on the honor roll? More than 6,000 dairy herds are now included in the National Herd Honor Roll, an increase of 1,000 herds over last year. These herds have all produced at least 300 lbs. of butterfat per cow per year. (See page 1053.)

How can unpalatable roughage be improved? By putting it through a feed cutter or grinder and then moistening it with thinned feeding molasses. Aside from its feeding value, the molasses, which is nearly equal to ground corn, gives a flavor relished by cows. (See page 1063.)

Junior Letters

A National Club Winner

Hoard's Dairyman Juniors:—I received the creed, pin, and fob some time ago. I think that the creed is a fine one. I am enclosing a picture of my registered Jersey heifer. Her name is Surville Sultan's Beauty. I purchased her in March, 1926, when she was two weeks old and enrolled in the 4-H club. I fed her

MILLARD BLAKESLEE AND HIS CHAMPION JERSEY

whole milk for the first few weeks, gradually changing to skimmilk. The grain ration consisted of equal parts of ground oats, bran, meal, and 10% linseed meal. When fitting her for the show ring I added a little more linseed meal.

I weighed her every month and she gained two pounds a day. I groomed her every day. I showed her at the Onondago County picnic and she won first prize. That entitled me to a free trip to the 1926 New York State Fair. When I showed her there she won first prize and championship of the Jersey breed. This entitled me to a trip to the National Dairy Show which was held in Detroit in October.

My county club agent, F. E. Heinzelman, his wife, three other boys, and myself went by automobile from Syracuse, N. Y. I sent my calf by train. On our way out we stopped at Niagara Falls which was a great sight to me. When I showed my calf at Detroit she copped first prize again. She won, altogether, about $120 in prize money. I had a fine time at the Dairy Show.

We have a 4-H club. It is named "The Beaver Lake 4-H Club." We hold meetings twice a month. There are eleven members in our club. Seven of us attended the Junior Field Days at Ithaca, where we all had a fine time.

I like club work and it has taught me many things. If you keep up with the 4-H spirit you are bound to come through on top. My address is Baldwinsville, N. Y.

Millard L. Blakeslee.

A Thanksgiving Poem

Hoard's Dairyman Juniors:—I am glad to be one of your new juniors. I am 10 years old. My birthday is the 12th of April. I am in the 5th grade in school. Here is a Thanksgiving poem I made up last year:

WHAT I'M THANKFUL FOR

I'm thankful for good things to eat,
For pumpkin pies and turkey meat;
For flowers that are red, yellow, and blue,
And for good friends so true.

I'm thankful that my dear Heavenly Father
Has kept me through the night,
For my dear mother and father,
And for the sun so bright.

I'm thankful for Thanksgiving Day,
When everybody is so gay;
For the pies and cakes
That mother bakes.

If any of the juniors wish to write to me, my address is R. 3, Black Creek, Wis.

Dorothy Miller.

My Calf Club Experiences

Hoard's Dairyman Juniors:—My father gave me a little Holstein calf this year for me to try to win a prize. I gave her oats, skimmilk, clover, alfalfa, and water. She was fed twice a day. The amount of oats fed per day was 1 to 2 lbs. She drank 14 lbs. of milk and ate about 8 lbs. of hay. She recognized my voice as soon as I said, "Rosie." She knew that I had something for her. Sometimes I had oats or milk. She liked to drink milk very much. I washed her every week. She was almost all white. When I washed her she was as white as snow.

When fair came I won first prize on the first day and second prize on the second day. I was very much pleased. I won $16.

I was secretary and treasurer of the Vulcan Calf Club. Peter Breclaw was the president, and Stanley Baciak the vice-president. We had five meetings. They were held at the farm of Jacob Paluch. One day we had a picnic after the meeting. The members of the calf club enjoyed it very much.

I am going to have a calf for the next fair, too. My address is Vulcan, Mich.

Joan Paluch.

Going Up in Club Work

Hoard's Dairyman Juniors:—I live in Eau Claire County in Western Wisconsin. I am 13 years old and live on a farm of 560 acres. We have Holstein-Friesian cattle. This summer we had 47 milk cows, 21 two-year-old heifers, 19 heifer calves, and 10 horses; hogs and poultry, also.

I belong to a club called the Pleasant Valley—Brunswick Club. I have been in the calf club for three years. I exhibited my calves at the county fair in 1925 and in 1926. The first year I received third place and the second year first place. I have a grade senior Holstein-Friesian calf this year. I was on a demonstration team this year and won second place in the county.

I enjoy reading the junior page. I would like very much to hear from some of my junior friends. My address is Box 86, Route 6, Eau Claire, Wis. Edward Wittwer, Jr.

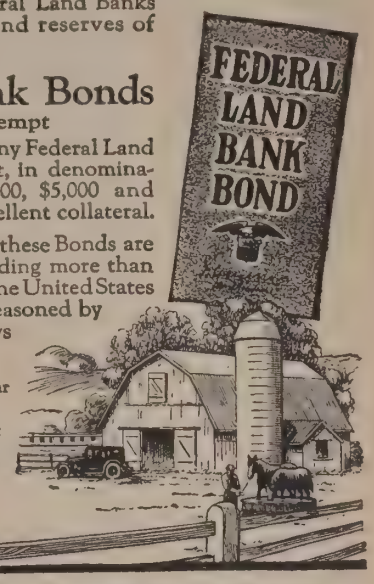
Guard Your Savings!

WHEN you have surplus funds to invest, play safe! Invest in Federal Land Bank Bonds—*safer than any single first farm mortgage.* Back of these Bonds are mortgages on more than 400,000 farms valued at over twice the amount loaned upon them. The prompt payment of principal and interest is guaranteed jointly by the twelve Federal Land Banks with combined capital and reserves of more than $70,000,000.

Federal Land Bank Bonds

Completely Tax-Exempt

You can secure these Bonds at any Federal Land Bank, or from the Fiscal Agent, in denominations of $40, $100, $500, $1,000, $5,000 and $10,000. Readily saleable; excellent collateral.



Over a Billion dollars' worth of these Bonds are in the hands of investors, including more than one hundred million dollars in the United States Government Insurance fund. Seasoned by ten years' test. Interest always paid the day it is due.

Announcing A New Improved Cow Hobble — Reichert's NO KICK Cow Hobble

Just slip the clamps around Bossy's legs, tuck in her tail and pull up the rope. Reichert's NO KICK Cow Hobble goes on easier and faster and holds more securely than other hobbles. Rope does not cut cow's legs like a chain, and has a double leverage pull.

Saves endless trouble in milking, shortens the time spent, and prevents a big waste in milk from kicked-over pails. Use the NO KICK once and you'll never be without this perfected hobble.

Enclosed please find.....for which send me.....sets REICHERT'S NO KICK COW HOBBLE.

DAIRY MARKET NEWS

Wisconsin October Condensery Prices

Forty-seven condenseries reported to the Wisconsin Department of Markets the prices paid in October per hundred pounds milk delivered at their factories. Reduced to a common 3.5 per cent test basis, these prices ranged from $2.10 to $2.50, the average being $2.24.

Seventeen factories sent delayed reports for September, the average being $2.24. This is seven cents above the previously reported average of $2.17 for 46 factories.

October Foreign Butter

The following table of foreign butter prices gives the average weekly quotations as published by the U. S. Dept. of Agriculture:

Market	Oct. 1927	Sept. 1927	Oct. 1926
	Cts.	Cts.	Cts.
New York	48.4	46.5	46.9
Chicago	46.2	45.0	45.9
Copenhagen	39.6	39.5	36.0
Berlin	41.3	40.5	36.1
London			
Danish	42.1	41.5	38.9
Dutch	42.3*	40.5*	36.1
New Zealand	38.6	38.9	31.5
Australian	38.1	38.0	31.0
Argentine	36.3*	37.2	32.7
Siberian	34.0		27.9

*Unsalted.

October Cheese

The wholesale price of cheese on the Wisconsin Boards averaged 26.8 cents for October, an increase of 1½ cents over September and over three cents above October a year ago. These advancing prices have permitted a no inconsiderable amount of Canadian cheese to break over the five cents a pound tariff wall. Prices broke two cents at the end of the first week in November, and trading was reported as slow.

Daily quotations from the U. S. Department of Agriculture show the following average wholesale prices for American cheese on the Wisconsin Primary Market during October:

	Oct. 1927	Sept. 1927	Oct. 1926
	lbs.	lbs.	lbs.
Twins	26.3	24.7	23.0
Single Daisies	26.8	25.3	23.6
Longhorns	27.0	25.8	23.8
Square Prints	27.7	26.2	25.0
*Receipts since Jan. 1	179,029	161,065	165,463
*Receipts for month	17,964	20,396	18,172
*Storage end of month	13,132	14,170	21,255

*In thousands of pounds at Chicago, New York, Boston, and Philadelphia (i. e.—000 omitted.)

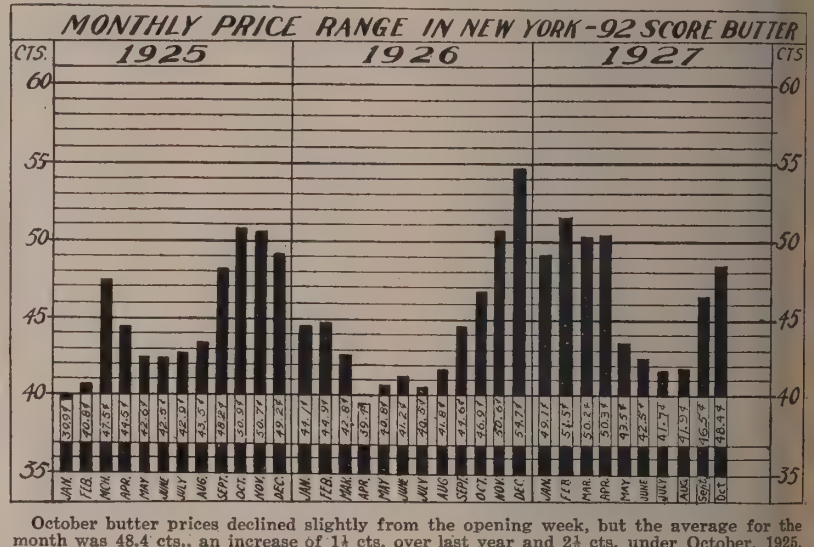
Cheese production for the first nine months of the year totaled 326,867,000 lbs., a decrease of over 26 million pounds from last year. Net imports were 52,262,000 lbs., an increase of eight million pounds over last year. Storage holdings of American cheese were 65,434,000 lbs., a decrease of twelve million pounds from last year but other cheese types increased nearly two million pounds. This brings the total estimated trade output to 366,076,000 lbs., a decrease of 3.4% in apparent consumption as compared with the same nine months of last year.

Wisconsin September Butter

Wisconsin co-operative creameries paid producers a net price of 51.5 cents a pound for butterfat in September according to reports from 69 of these creameries to the Wisconsin Department of Markets. These creameries received an average of 46 cents a pound for butter, making a spread of 5.5 cents between the price received for butter and the p paid for fat.

The range in prices paid for fat was 47 to 55 cents, with the price received butter ranging from 43.4 to 46.9 cents. overrun ranged from 21.9 to 25.2 per cent. ceipts of fat averaged 26,226 lbs. per crean

The Feed Market Situati



(By The Grain, Hay, and Feed Ma News Service, Bureau of Agricultural nomics, U. S. Department of Agriculture.

Following a period of declining prices in October, largely because of the unusu good pasturage, feed prices turned up early in November when rains and c weather overspread a wide area. Quotat at this writing (Nov. 9) are about the s as or slightly higher than two weeks ago.

Production of wheat feeds for Septe was the smallest for that month since The domestic output of wheat feeds for three months, July—September, totaled a 1,286,700 tons against 1,399,300 tons a year Imports for this period were also smaller, flecting in part the delayed movement Canadian wheat to market, and totaled 4 tons compared with 54,736 tons for t months in 1926.

Linseed meal quotations have been irr lar during the past two weeks but are fractionally higher than at the beginnin the period. Minneapolis mills were experi ing difficulty in moving their output and t the price declined to a low point of ar $44.50 a ton. Somewhere around this large amounts of meal were sold and pl then turned upward.

Exports of linseed cake and meal in tember totaled 26,492 tons compared 24,129 tons last year. This brings the for the season September—August to 324

October butter prices declined slightly from the opening week, but the average for the month was 48.4 cts., an increase of 1½ cts. over last year and 2½ cts. under October, 1925.

over three cents above October a year ago. These advancing prices have permitted a no inconsiderable amount of Canadian cheese to break over the five cents a pound tariff wall. Prices broke two cents at the end of the first week in November, and trading was reported as slow.

Daily quotations from the U. S. Department of Agriculture show the following average wholesale prices for American cheese on the Wisconsin Primary Market during October:

	Oct. 1927	Sept. 1927	Oct. 1926
	lbs.	lbs.	lbs.
Twins	26.3	24.7	23.0
Single Daisies	26.8	25.3	23.6
Longhorns	27.0	25.8	23.8
Square Prints	27.7	26.2	25.0
*Receipts since Jan. 1	179,029	161,065	165,463
*Receipts for month	17,964	20,396	18,172
*Storage end of month	13,132	14,170	21,255

*In thousands of pounds at Chicago, New York, Boston, and Philadelphia (i. e.—000 omitted.)

Cheese production for the first nine months of the year totaled 326,867,000 lbs., a decrease of over 26 million pounds from last year. Net imports were 52,262,000 lbs., an increase of eight million pounds over last year. Storage holdings of American cheese were 65,434,000 lbs., a decrease of twelve million pounds from last year but other cheese types increased nearly two million pounds. This brings the total estimated trade output to 366,076,000 lbs., a decrease of 3.4% in apparent consumption as compared with the same nine months of last year.

Wisconsin September Butter

Wisconsin co-operative creameries paid producers a net price of 51.5 cents a pound for butterfat in September according to reports from 69 of these creameries to the Wisconsin Department of Markets. These creameries received an average of 46 cents a pound for butter, making a spread of 5.5 cents between

tons in 1926—27 compared with 294,527 last year. These are the largest exports in cent years with the exception of the 3378 tons exported in 1924—25.

Cottonseed Meal Also Higher

Cottonseed meal shared in the increa feeding demand and prices worked gene higher with mills not pressing sales. Dem however, was becoming slightly less activ the higher levels. The cotton crop is fore on November 1 at 12,842,000 bales comp with nearly 18,000,000 bales last year. would indicate that only a little over thirds as much cottonseed cake and mea likely to be available this year as from year's record harvest. Export demand a been fairly active and exports for the first months of the season total 41,428 tons ag 48,873 tons for these months in 1926.

Gluten feed quotations are practi steady. Production continues heavy t gluten feed manufacturers grinding a 8,613,000 bushels during October comp with 7,057,000 bushels a year ago. Late in tober a number of resellers at Buffalo willing to accept 50c a ton under mill qu tions for this feed but with the increased mand this discount has disappeared althou few independent mills and resellers were offering liberally on the November basis. Corn Products Company was offering for December shipment at 50c a ton prem over the November quotations. Offering Chicago were liberal but seemed to be re absorbed. Demand was good and no accu lation of stocks was reported.

Hominy feed prices declined sharply la October in sympathy with the weakness corn markets but have shown an upward t in the past few days.

Alfalfa meal was also slightly firmer, ticularly as reports indicate that the grind in some of the important producing areas have been restricted by weather conditions. supply of best quality green meal contin hardly equal to current requirements bec of the limited amounts of hay suitable for meal. This is largely due to the unusual r in a number of the irrigated sections. O

of the lower grades of meal, however, been fully equal to current needs.

inkage prices have moved up and down are now on the same level as some time with 60% digester tankage quoted at $70 n in carlots at the principal markets.

Quoted Nov. 9

andard spring wheat bran: $28 Minneapo- $31.50 Buffalo, $35 Philadelphia, $30.75 ago. Hard winter wheat bran: $27 Oma- $27.50 Kansas City. Soft winter wheat : $35 Philadelphia, $32 Cincinnati, $29.75 Louis.

andard wheat middlings: $31.50 Buffalo, 25 Chicago, $29 Minneapolis. Soft wheat llings: $34.75 St. Louis. Gray shorts: Omaha, $32 Kansas City.

ttonseed meal (43%): $49 Philadelphia, Cincinnati, $46 Chicago, $45.50 Kansas $39 Fort Worth.

nseed meal (34%): $46 Buffalo, $50.50 innati, $47.50 Chicago, $45.50 Minneapolis, 0 Omaha.

uten feed: $39 Buffalo. White hominy : $35.50 Buffalo. Alfalfa meal: $25.50 Louis, $23 Omaha, and $22.50 Kansas City.

October Butter

tter averaged 48.4 cents in October on New York market. This is an increase of ly two cents over September and 1.5 over October of a year ago, but is 2.5 under the October average in 1925. The et held firm at 48 cents for the first two s of November, with the promise of some nces.

ily quotations from the U. S. Department Agriculture show the following average esale prices on 92-score butter (extras) our of the principal markets, together receipts and storages:

	Oct. 1927	Sept. 1927	Oct. 1926
	Lbs.	Lbs.	Lbs.
ago	46.2	45.0	45.9
York	48.4	46.5	46.9
on	47.8	46.2	46.6
delphia	49.4	47.5	47.9
eipts for month	37,244	41,277	36,119
eipts since Jan. 1	502,014	464,770	490,855
age (end of mo.)	55,549	68,090	54,116

n thousands of pounds at the four markets —000 omitted).

nety-score butter averaged 43.7 cents for ber in Chicago, with centralized butter at market selling for 43.5 cents. Jobbers' s on extras sold to retailers averaged 48.7 in Chicago, a spread of 2.5 cents above lesale.

eamery butter production for the first months of the year was 1,187,877,000 lbs., ncrease of 18 million pounds over last Net imports were 4,004,000 lbs., an in- e of nearly four million pounds over a ago. Storage holdings were 147,412,000 on October 1, 22 million pounds greater last year. This makes an estimated trade t of 1,558,276,000 lbs. for the first nine hs of the year, a decrease of two per cent the same period of last year.

Milwaukee October Milk

e Milwaukee Co-operative Milk Producers unce the following prices for the month ctober:

r the portion sold as fluid milk, $3.00 cwt.; and for the portion manufactured, per cwt. These prices apply to 3.5 per milk delivered f. o. b. city, four cents be added or subtracted for each one-tenth e per cent variation in test. Eighty-five five-tenths per cent of the total receipts sold as fluid.

Sheffield October Price

e cash price for October, 1927, paid ield producers for three per cent, Grade ilk in the 201—210-mile zone is $2.81 per red pounds, with the usual freight and rfat differentials. This is equivalent to for 3.5 milk and is an increase of 8c undred over September, 1927, and an in- e of 21c per hundred over October, 1926. W. HALLIDAY, Secretary.

Camel

The cigarette that earned first place by its goodness

The greatest endorsement ever given to a cigarette is revealed by the fact that Government figures show that more Camels are being smoked today than ever before. An endorsement by the many—not the few.

If all cigarettes were as good as Camel you wouldn't hear anything about special treatments to make cigarettes good for the throat. Nothing takes the place of choice tobaccos.

TOBACCO

Natural Leaf Tobacco—Best grade, guaranteed, 5 pounds chewing $1.00, 12 pounds $2.00; 12 pounds smoking $1.50, pipe free. Pay when received. VALLEY FARMERS, Murray, Kentucky. 20-4

Homespun Tobacco—Guaranteed, good flavor, Chewing, 5 pounds, $1; 10, $1.75. Smoking, 5 pounds, 75c; 10, $1.25. Pay when received. FARMERS UNION, Mayfield, Kentucky. 21-4

Tobacco: Kentucky Sweetleaf. Mellow; aged. Smoking 15 pounds $1.65; chewing $2.25. Pay when received. ERNEST CHOATE, Wingo, Ky. 22-4

ROCK PHOSPHATES

Our finely ground raw rock phosphate greatly increases yields of small grain and hay crops. Cheaper than acid phosphate. Write for literature and prices. ROBIN JONES PHOSPHATE COMPANY, 572 Bennie Dillon Building, Nashville, Tennessee. 20-*

MISCELLANEOUS

If your auto radiator leaks, I guarantee my new compound will fix it or money refunded. Generous can $1.00 postpaid. R. BUTLER, Horicon, Wisconsin.

Buy one of our leather bound loose leaf pocket herd books and be able to give accurate information regarding the animals you have for sale. Will accommodate 100 animals, (sketches, sire, dam, date of birth, records, service date, etc.). Also service record, gestation table. Price $2.00, postpaid. HOARD'S DAIRYMAN, Fort Atkinson, Wis. 24-*

FARMS FOR SALE

The Dairyman in the Ozark region of Southern Missouri and Northern Arkansas operates with 9 or 10 month's open grazing on clean rolling pastures—pure fresh streams of mountain spring water—fine grained clay soil producing a wealth of grass. Mild and healthful climate, average winter temperature 41.6, average summer temperature 78.9. Proximity to the great markets of St. Louis, Kansas City and Memphis makes quick delivery and good prices. Prosperous growing communities, good schools and fine hard surfaced roads. Land can still be bought or farms rented at reasonable prices, insuring good profits for the dairyman. Write for more information about this land of great opportunity. FRISCO RAILWAY, 880 Frisco Bldg., St. Louis, Missouri. 20-Spl

For Sale—A grade A dairy farm complete. Modern dairy barn and covered barn yard. Cement everywhere, a 3½ hour milk route, fully equipped dairy house. Frigid air cooler water system, lights and water everywhere. Regular milk selling at 10—11 and 12c per quart, this milk selling at 15 and 17c quart, ½ pints at 5c. Located 1½ miles from center of town of 9000 and 32 miles from town of 100,000. 20 cows, 1 herd sire, 50 chickens, two large coops. Located in the finest dairy country in the U. S. Write for description, location, pictures, price and terms. Only prospective buyers need apply. A real place for a man and two boys. Possession at once. Address BOX 577, care Hoard's Dairyman, Ft. Atkinson, Wis.

274 Acre Equipped tractor farm overlooking beautiful valley. Close village, short drive city; 135 acres tillage, abundantly watered pasture for 40 head, timberlot and fruit; good 9-room home, furnace, electricity; big cement basement barn, piped spring water. Sacrifice at $8000 & 16 cows, 8 heifers, bull, 3 horses, hens, tractor and equipment, farm & dairy tools, hay, buckwheat, oats, potatoes, millet, etc. included; part cash. Details page 8 illustrated fall bargain catalog. Free. STROUT AGENCY, 255-DL, 4th Ave., New York City.

Dairy Farm—320 acres Jefferson County, Kansas, 3 miles market, town 500, good high school, good road, 40 miles Kansas City, mostly hard surface, balance completed soon. Land high state cultivation, all smooth, gently rolling, well watered. Blue grass pasture, alfalfa, corn, oats produce well. All kinds fruit, large dwelling, water and electric lights, 3 good barns, 2 silos. Good milk market, condensery. Financed long time loan, priced at great sacrifice by owner. Address BOX 558, care Hoard's Dairyman. 21-2

Land in North Dakota—$5,200 is the average income per farm in North Dakota this year. Mixed farming has brought a good crop of wheat, corn, alfalfa, livestock, poultry, honey. Come to North Dakota now while acreage is still cheap and before diversified farming doubles land values. Congenial neighbors, splendid schools and churches, good roads and railroad facilities. Write for details. GREATER NORTH DAKOTA ASSN., Dept. 6, Fargo, N. D. 22-2

Dairying Opportunities—Bargain priced farms in Minnesota, North Dakota, Montana, Idaho, Washington and Oregon suitable for intensive dairying from standpoint markets, climate and feed crops. Free literature and settlement service. Write mentioning state. H. W. BYERLY, 117 Northern Pacific Railway, St. Paul, Minn. 19-4

Owner killed and wife wants to sell or rent farm. Three-fourths mile from town, church and school. Fully equipped except cattle. ANNA J. BROCKETT, Spooner, Wisconsin.

One of southern Michigan's best 80 acre dairy farms will be sacrificed for quick sale. In Eaton county twenty miles from Lansing. Write BOX 987, Kalamazoo, Michigan.

For Sale—By owner, forty-five acres near Spokane, on graveled road. Thirty-five acres in cultivation, balance pasture. RALPH C. GREEN, Clarkston, Wash.

Virginia Dairy Farm—178 acres, fertile soil, all necessary buildings, good milk market. Write for information. J. L. LEE, Norge, Virginia.

Dairy farms, 160 and 302 opposite, on highway, near Ottawa, Kansas. Terms. REV. STUCKER, Owner, Ottawa, Kansas.

FARMS WANTED

Want 160 to 300 acres improved and fully equipped WALT MILLER, Carpenter Bldg., Milwaukee.

Wanted—Fully equipped dairy farm for my Chicago garage flat building. P. B. JOHNSON, Zion, Illinois.

FOR RENT

Renters Wanted—Write for free books and list of improved farms for rent in North Dakota and Minnesota, productive for small grains, clover, alfalfa, dairying, cattle, sheep and hogs. Good schools, markets, churches in fast developing communities where land can be purchased on easy terms. Low homeseekers' rates every Tuesday. E. C. LEEDY, Dept. 682, Great Northern Railway, St. Paul, Minn. 17-*

Model Large Dairy Barns, alfalfa and corn farm, without stock. WILFRED EPES, Blackstone, Va. 20-3

WANT TO RENT

Swiss Dairyman who doesn't need any financial help, looking for 160 acre farm. Must have good buildings and fences. Farm close to big city preferred. Best references. Address BOX 576, care Hoard's Dairyman.

DAIRIES

Fifty Cow Dairy South Florida. Also ten thousand acre cattle ranch. J. M. WILLSON, Kissimmee, Florida. 22-4

DAIRYMAN WANTED

Young man with few hundred dollars to carry on fine Florida farm of aged man who must retire. No triflers. Great chance for right man Address BOX 566, care Hoard's Dairyman.

TESTERS WANTED

Testers Wanted December first—For one year in 12 Dairy Herd Improvement Associations with salary $900 and up. Prefer single men over 21 years, having Short Course or Assistant Herdsman training. Tell age, practical experience in dairy cattle feeding, school training, and operating a Babcock tester first letter and 2 references. Write or apply in person to A. J. CRAMER, Dairy Records Office, Madison, Wisconsin.

Iowa Cow Testing Associations need testers. Salary $900 per year and up, plus board. Training courses offered. Give age, experience, references first letter. DAIRY EXTENSION, IOWA STATE COLLEGE, Ames. 20-*

Wanted—One experienced tester Dec. 1st. DAIRY EXTENSION DEPARTMENT, Blacksburg, Virginia.

PRINTING

Letter Heads—We specialize in printing Farm Letter Heads. Give us a trial. HOARD'S DAIRYMAN ART DEPT., Fort Atkinson, Wis. 19-*

Coupon Milk Tickets, Score Cards, Tags, Route-books, Statements, etc. E. F. WILKE & CO., 2424 N. Francisco Ave., Chicago, Ill. 22-2

Swine

Feeding Oats and Corn to Pigs on Pasture

t threshing time on a good many as in the major swine growing ion of the country, the corn sup- is likely to be nearly if not entire- epleted and for a time thereafter ll grains, particularly oats, com- e the main part of pig rations. As n as corn is matured sufficiently feeding, it again becomes the ma- feed, frequently the only cereal n. Oats and corn, therefore, with ey to a limited extent, constitute basal part of pig rations over a e area.

he Minnesota Experiment Station recently reported the results of a ing experiment, the purpose of ch was to find out the most satis- ory proportion of feeding oats and to growing pigs on pasture.

our lots of pigs averaging about lbs. were fed a 3 per cent grain al- nce (about three-fourths of a feed or 3 lbs. of grain for each lbs. live weight) on rape pasture. addition a complex mineral mix- was self-fed. Enough tankage fed each lot to properly balance rations with respect to protein. ions were hand-fed twice daily for eding period of 120 days.

he grains fed each lot were as fol- s: Lot I had shelled corn; Lot II led corn two-thirds and whole one-third; Lot III shelled corn whole oats one-half each; Lot IV led corn one-third and whole oats -thirds. In addition, as already ed, each lot had tankage minerals rape pasture.

he average daily gains were .87 .81 lb., .74 lb., and .71 lb. respec- ly for the four lots.

he total feed required for 100 lbs. in the different lots was 373 lbs. lbs., 430 lbs., and 439 lbs. respec- ly.

he feed cost of 100 lbs. gain was 6, $7.06, $7.40, and $7.18 respec- ly for the different lots.

he feed prices applied were $1.00 bushel for corn; oats, $.45 a hel; tankage, $70 a ton; minerals, 0 per hundred. A uniform pas- charge of 25 cents a pig a month made.

When oats is fed as in this ex- ment, the price a bushel should less than one-half that of corn if to be as cheap as corn.

mparing Three Breeds of Swine

he Minnesota Station makes a gress report on a swine feeding eriment, the purpose of which is compare the relative merits of e breeds of swine as to efficiency onverting feeds into meat as also quality of meat produced.

lot each of Yorkshire, Poland na, and Duroc Jersey pigs averag- about 50 lbs. each were fed the ne kind of ration.

he feeding plan followed was to w the pigs during the summer on bluegrass pasture, feeding a 3 per cent allowance of grain. The feeds used were shelled corn and ground barley in equal amounts supplemented by a mixture of 100 parts middlings, 10 parts linseed meal, and tankage 5 parts. In addition 2 to 2.5 lbs. of buttermilk to each pound of other feeds was fed.

To finish these pigs a full allowance of corn, barley, and buttermilk was fed the last six weeks.

The Yorkshires gained 1.07 lbs. per head daily, the Poland Chinas, 1.16 lbs., and the Duroc Jerseys, 1.14 lbs.

The feed cost of 100 lbs. gain was $6.60 for the Yorkshires, $6.23 for the Poland Chinas, and $6.32 for the Duroc Jerseys.

No considerable differences were found in the dressing percentages as also nothing outstanding as to differences in quality of meat as revealed by curing and cooking tests.

Reducing The Cost of Protein Supplement

The Minnesota Experiment Station has reported the results of another swine feeding experiment, the purpose of which was to determine if cereal grains might be supplemented more cheaply in dry lot feeding than with tankage as the only supplement.

Skimmilk or buttermilk usually has proved to be the most satisfactory of the common protein supplements but tankage, linseed meal, and alfalfa meal have given good results. Except in the case of the milk by-products, the feeds mentioned are incomplete proteins. Some of the essential parts of proteins are lacking and accordingly a limit is placed on the ability of pigs to gain rapidly. Since in different protein supplements there are shortages of various kinds, combinations of these feeds, if properly made, should form a complete and satisfactory supply of protein for pig development.

Four lots of pigs were each self-fed shelled corn and a mineral mixture composed of 30 parts spent bone black, 30 parts pulverized limestone, 15 parts common salt, 15 parts charcoal, 7 parts Glauber's salt, 2.97 parts iron oxide, and .03 part potassium iodide. In addition to this Lot I was self-fed tankage, Lot II a mixture of 9 parts tankage and one part alfalfa meal, Lot III a mixture of one part tankage and one part linseed meal; Lot IV a mixture of 4.5 parts tankage, 4.5 parts linseed meal, and one part alfalfa meal. The feeding period was for 105 days.

The average daily gains were 1 lb., 1.25 lbs., 1.3 lbs., and 1.32 lbs. respectively per head for the different lots.

The feed required for 100 lbs. gain was 414, 377, 377, and 374 lbs. respectively.

The feed cost of 100 lbs. gain was $8.32, $7.54, $7.45, and $7.29 respectively. The pigs that received 4.5 parts tankage, 4.5 parts linseed meal, and one part alfalfa meal as a supplement to corn made the largest daily gain at the lowest feed cost per 100 lbs. The gain cost over $1 a hundred more than where tankage alone was fed as a supplement.

The prices applied for feeds were $1 per bushel for corn, $70 per ton for tankage, $45 per ton for linseed meal, $18.50 per ton for alfalfa meal, and $3 per hundred for minerals.

Construction and Use of Self-feeders

Frequently we have inquiries concerning the construction of self-feeders for swine. These indicate that such feeders have become a part of the standard equipment on many farms and well they might because of the saving of labor in feeding hogs.

The Illinois Station has put out a new bulletin, "Construction of Self-Feeders and Their Use in Pork Production," and it is a good one. The illustrations showing how self-feeders may be constructed are numerous and easily understood. The Illinois Experiment Station is at Urbana; the number of the circular is 319.

Feeding Alfalfa Hay

Alfalfa hay as a winter feed for pregnant sows and gilts deserves considerably more attention than it receives, according to the results of carefully controlled experiments.

The Nebraska Station reports feeding some sows averaging 345 lbs. on December 25 for a period of 70 days on a ration consisting of shelled corn and alfalfa hay fed in rack. The corn was fed at the rate of one per cent of the live weight of the sows and they therefore received daily one pound of corn for each 100 lbs. live weight. The sows had free access to the alfalfa hay. They averaged to gain 32 lbs. each in the 70-day period and farrowed pigs that weighed 2.3 lbs. each at birth.

The Iowa Station reports feeding a pen of 5 bred gilts through the winter on an average daily feed consumption of 3.74 lbs. corn and 1.11 lbs. alfalfa hay fed in rack. The gilts gained .63 lb. each daily, farrowed an average of 7.6 pigs that weighed 2.29 lbs. each at birth, and were 89.47 per cent strong at birth.

College Bred

"Papa," said the small son, "what do they mean by college bred? Is it different from any other kind of bread?"

"My son," said the father, "it is a four years' loaf."

J. S. Caldwell, Vinton, Iowa, let the hogs follow the plow to clean up the grub worms in a well-fenced 10-acre clover pasture when he broke it up for corn. His crop ran 60 bushels to the acre at $1.10, a total of $660.00. On his other ten his fence was poor. Grubs got all but 150 bushels—a total loss of 45 bushels per acre that could have been saved with a hog-tight fence. "You can borrow $1,000 at 7%, put it into fence and make money", says Mr. Caldwell. We claim

RED BRAND FENCE

"Galvannealed"–Copper Bearing

is the best investment any farmer can make. A great many have proved this true. They know, from experience, that hogging down, pasturing after harvest and crop rotation will pay for RED BRAND FENCE in from 1 to 3 years. They know, too, that this real good, copper-bearing steel with its extra heavy zinc "galvannealed" coating keeps rust out; that these two things make RED BRAND cost less by lasting longer. Its stiff stays, well-crimped line wires, can't-slip knots, help keep it straight, trim, hog-tight and bull-proof. The fence that will last the longest is the cheapest fence to buy.

What has been your experience with or without good fence? We will pay $5 or more for each letter that we use. Write for details, catalog and 3 interesting booklets that tell how others have made more money with hog-tight fences.

Always look for the Red Brand (top wire)

Keystone Steel and Wire Co.

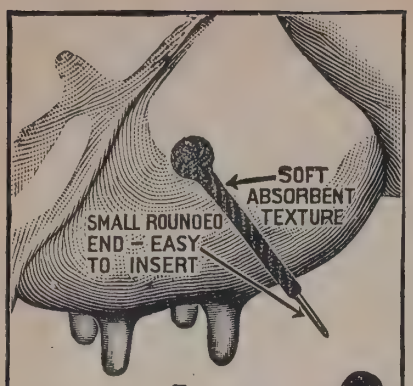
Lower the Cost of Producing Pork



There is a cost line running through every animal on your farm. Thousands of owners in every state have positively proved that you can lower the cost of producing pork, beef, milk and mutton with the Letz System of Home Crop Feeding. Many prominent hog raisers are feeding up to 25% ground alfalfa or other legumes in hog rations. 50,000 owners say that Letz Mixed Feed Makers will:

1. Save 25% to 50% of present feed crops by utilizing waste.
2. Release up to 30% of your present feed crop acreage for cash crops.
3. Increase milk and meat production up to 30% through better feed preparation.
4. Save up to 25% of labor in handling feed crops.
5. Improve health and condition of all farm animals.

Write today for free copy of "The Letz System of Home Crop Feeding." Filled with practical suggestions and records of results on feeding the Letz way.

SPROUTED OATS — FOR — STERILE COWS

Extensive experiments the past two years have demonstrated that sterility in cows may be overcome simply by feeding a ration of SPROUTED OATS such as is produced in Grain Sprouters for poultry. Sterility is often caused by functional disorders and a correct dietary overcomes this barrenness. Vitamin E has been found to have a powerful effect on the reproduction organs of animals and this fifth Vitamin is found in bountiful quantities in properly sprouted oats. FREE How to turn losses Cows Calves Poultry Pigs into Profits

Tells how to deal with

infectious organisms and avoid losses from live stock diseases that cost American farmers three hundred million dollar losses each year.

Abortion

Abortion is caused by germ infections of several kinds. What these germs are; how they are spread, and what can be done to prevent it; also how to control it where disease is present, are things you should know. The book tells these things.

Calf Scours

is also a germ infection. It is easily prevented and controlled by feeding B-K in the drinking water. B-K corrects stomach acids, helps destroy the infection and restores normal condition of stomach and bowels. The book explains this, also how to remove

Retained Afterbirth

with a warm water solution of B-K, using only a small rubber hose, funnel and a pail or pitcher. Releases adhesions and reduces inflammation, so the afterbirth comes, naturally without force. B-K contains no poison nor acid—is safe, dependable and cheap. Buy a jug at your dealers and follow the simple directions. Money back if not satisfied.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Swelling of the Brisket

A reader wants to know why the brisket of one of his cows is badly swollen, yet is not hot, red, or sore. He states that he had a cow in the same condition several years ago and that she died despite treatment; also that he had seen other cows with swollen briskets that did not die or show much inconvenience from the condition.

This is an interesting inquiry in that it refers to two different conditions and emphasizes the importance of making a correct diagnosis. The cow in question is in all probability affected with traumatic pericarditis or heart disease, caused by a swallowed wire, nail, or other sharp object transfixing the wall of the stomach, the diaphragm, and sac of the heart. We are of that opinion for the reason that our correspondent mentions that the cow is sick, listless, and weak, in addition to showing the swollen condition of the brisket. That being the case we think it likely that he will be able to hear a splashing or sloshing sound of liquid when he places his ear against the chest wall, just behind the elbow on the left side of the body. No such sound is heard in the ordinary cases of swollen brisket which are not associated with sickness or much inconvenience of any kind. In severe cases of traumatic pericarditis one sometimes may hear the splashing sound at a little distance and the cow is so weak that she may fall and die when made to run. She is also emaciated, harsh in hair, and has lost much of her appetite and does not yield much milk.

This heart disease is occasionally curable if it can be detected by the veterinarian before the animal has become seriously affected. It is possible for him to remove the offending wire or nail by cutting into the paunch and introducing his hand and arm, or he may also have to cut through the chest wall and tap the sac of the heart for removal of a large quantity of foul smelling fluid. At the same time it is barely possible that he may be able to locate and remove the foreign body that has caused the disease. Prevention is all-important by keeping sharp objects away from cows, so far as that proves possible. The cow referred to by our correspondent may not be too far advanced in the disease to recover, when surgically treated.

The other cows mentioned, that had swollen briskets but were not sick or much inconvenienced, no doubt had bruised the parts upon the manger or floor in such a way as to have caused serum to exude into the tissues. That condition is called "hygroma" and it is exactly the same as the like soft swelling or serous abscess or sac so often seen on a cow's knee. Treatment consists in moving the cow into a pen and then bathing the swelling persistently with cold water and vinegar and applying tincture of iodine daily. That may prove remedial if done at the outset of the condition, for the fluid may be resorbed; but in old, standing cases it is necessary for the veterinarian to liberate the fluid by lancing under asceptic conditions. He will then remove clots of blood or fibrin, syringe out the cavity, inject tincture of iodine, and pack the cavity with a strip of sterilized gauze or a rope of teased oakum saturated with an antiseptic solution, and instruct the owner or attendant how to give appropriate after-treatment.

Pink Eye

About two months ago I noticed water running from the eye of a yearling steer and later the other eye was running. Some time after a heifer started the same way and now three heifers and two cows are affected. It shows an eyeball first blue and then white and later pink. Now one heifer seems to be almost blind.

Savage, Mont. I. L. L.

The cattle are affected with contagious keratitis, commonly called "pink eye." It is caused by a specific germ and quickly spreads to all animals in the herd. Move affected cattle into a partially darkened stable and supply a laxative diet. Treat by bathing affected eyes 2 or 3 times daily with a solution of one tablespoonful of boric acid in one quart of boiling water, used cold. Apply it each time with a fresh swab of sterilized cotton. In the evening put a little bit of yellow oxide of mercury ointment (ophthalmic) in the inner corner of each affected eye and also apply it to the eyelids. If there is a heavy discharge from an eye wet the eyeball twice daily with a 15 per cent solution of argyrol after using the boric acid solution and when the discharge abates use the ophthalmic ointment until the disease subsides.

Purulent Mastitis

I've had trouble with my young Holstein cow ever since I've had her (6 mos.). The party that I got her of let her udder rise. Now half of her udder continues to swell up and burst and run pus for three or four weeks, then heals up and begins to swell again and in three or four weeks will burst again.

Gulfport, Miss. J. A. M.

Isolate the cow and then cleanse, disinfect, and whitewash the stall she has occupied including the floor and gutter. Her udder is incurably affected with strepococci mastitis (garget) and her milk is unfit for use by people or animals. Catch the milk in a vessel containing a disinfecting solution and then throw it out in a place from which cows are excluded. The infection is readily carried from cow to cow by the milker's hands or may be contracted by the teats coming in contact with a floor or ground upon which purulent milk has been allowed to fall. Dry off the remaining milk secretion and fit the cow for the butcher, if you think that will pay. Rub a mixture of equal quantities of carbolized oil, camphorated oil, and compound soap liniment into the udder once or twice daily during the drying off process. Have the affected cow attended to by a person who does not milk other cows.

Holding Up of Milk

I have in my charge what would be a very fine Jersey cow but she has short teats and is a very hard and slow milker. She has formed the habit of holding up a part of her milk about every other milking and sometimes twice out of three milkings. Do you think her being hard to milk would cause her to form this habit? She is gentle and a very nice cow to handle, having no bad habits except this. I do not think the trouble is caused by excitement.

Greensboro, Ala. J. R. S.

We do not believe that a cow has the power of willfully "holding up" her milk as milk secretion is controlled by the sympathetic nerve system and not by the voluntary nerves, although both systems are intimately associated. The holding up of milk is

Electricity for the Farmer—Power

(Continued from page 1094)

feed could be discharged. It was fed from a magazine bin over the hopper. By reducing the speed of the grinder, they found they could run it with a one horse power motor. A clock started the grinding and stopped it unless the supply of grain in the bin was exhausted before the time for stopping came. In that case a valve in the bin opened the starting switch.

Grinding plate clearance inches	Power consumption test 6" feed grinder kilowatts used	Corn ground per kilowatt hour
Idle	0.17	0
0.21	1.04	365
0.195	1.04	356
0.1811	1.04	350

One Wisconsin farmer who is grinding with electricity installed a small burr mill on a post support so that it could be fed by a spout from a bin upstairs, and discharge into a sack at the foot of the post. A neighbor down the road has a burr mill fitted with a large hopper. There is plenty of room for the ground feed under the mill so it can run for considerable periods without attention. Still a third farmer grinds with a small hammer mill. It is supported above a concrete stall in the barn and fed from an upstairs bin by a spout fitted with a slide. The ground feed discharges into the stall which is boxed to retain the dust.

Tests on these mills showed the following current consumption for grinding:

Size	Ave. h. p. required	Size of motor	Repairs (sets burrs)	Used daily during grinding season	Kw. hrs. per mo. during grinding season
				Lbs.	
6" burrs	3	5 h. p.	4	300	18
6" burrs	1–1½	2 h. p.	2	150	35
Small hammer	5	5 h. p.	None	250	12

Further tests were made with new and dulled burrs. The new ones ground 100 lbs. of oats with .2 kilowatt hours of current; the dull took 4.75 kilowatt hours for the same amount; that is twenty-four times as much.

Material	Grinding Kilowatt hours of current per 100 lbs. ground
Corn, shelled	0.25
Corn, ear	1.00
Oats	1.00
Rye and wheat	.50
Hay	1.10
Bone	1.10

Sawing is another winter job for the portable motor. When the wood pile is ready and the saw set up, the motor can be pushed over and belted directly to the saw. One fine, frosty morning when the thermometer stood at fourteen degrees below, a test run was made on a Wisconsin farm where a 5-horse power motor was running a 28" cord wood saw. A cord of mixed green wood was cut into 12" lengths, three cuts to a stick, in twenty-four minutes, and with a current consumption of 1.2 kilowatt hours. The saw kept three men busy.

The buck saw and the cross cut are following the scythe and cradle into history. Iron muscles are beginning to shoulder their jobs.

Relation Between Horses a Man Uses and Value of the Crop He Produces

	Horses per worker	Value of production per worker
Italy	.19	$ 45.00

10% more milk

Doubles your profit

Noted dairy experts say that in the average herd one-tenth more milk will *double* the net profit. It costs no more, for instance, to house, feed and care for a good milker than a poor milker. After actual expenses are met every quart of milk is net profit. What other effort on the farm will pay you so handsomely as intensive milk-production?

Let Kow-Kare work for you this winter. Use it—as thousands of other money-making dairies are doing—to systematically regulate and condition your cows so that they are able to turn their food into big milk yields. A few cents per month per cow pays for all the Kow-Kare needed—a mere fraction of your certain returns.

For cows about to freshen, give a tablespoonful of Kow-Kare at feedings for two or three weeks before and after calving. It builds vigor to stand the strain of calf-birth, and to resist disease.

Barrenness, Retained Afterbirth, Abortion, Bunches, Scours, Lost Appetite, etc., are all successfully treated with Kow-Kare. Full directions on each can. Feed dealers, general stores and druggists have Kow-Kare. Large size $1.25; 6 cans for $6.25. Small size 65c. Send for booklet, "More Milk from the Cows You Have."

you can do it... here's how

The regular conditioning of cows with Kow-Kare calls for only a tablespoonful in the feed one to two weeks each month—depending on the general vigor and productiveness of the individual cow. Give this plan a trial this winter on the whole herd. It costs so little and does so much you cannot help but profit by it.

Dairy Association Co., Inc.
Lyndonville, Vermont

KOW-KARE

Regulates *and* Conditions

Home-Mix Your Own COMPLETE MINERAL
With Kow-Kare you can easily mix your own complete mineral at a surprisingly low cost—a mixture of recognized conditioning value. Simply mix 30 lbs. salt, 30 lbs. fine-ground lime, 30 lbs. steamed bone meal and four cans (large) Kow-Kare. For well under $6 per hundred you will have an unbeatable mineral. Use 80 lbs. of this mixture to a ton of grain.

How to Know Blood Diseases in Your Herd

Barrenness or Sterility, Slinking of Calves, Retained Afterbirth, Goiters in Calves, Scours in Calves, Infected Sire, Shortage of Milk.

If your herd is afflicted with any of these ailments you will know they are not doing their best. You can stop these losses at small expense.

Ask for FREE copy of "The Cattle Specialist" and learn how to increase your profits. Write Dr. David Roberts for free Veterinary Advice.

Starts Hens Laying

Here's a New Way to Get Eggs in Winter. Costs Nothing to Try

A letter from Miss Dama Wright, Vernonia, Ore., has a real idea for chicken raisers who are not getting plenty of eggs. She says:
"Late in October, our fifteen hens were not laying at all. I started giving them Don Sung, and for ten days they still didn't lay. But on the eleventh day they laid thirteen eggs, and it is wonderful what Don Sung has done for our egg basket."
Don Sung, the Chinese egg laying tablets which Miss Wright used, are opening the eyes of chicken raisers all over America. The tablets can be obtained from the Burrell-Dugger Co., 316 Postal Station Bldg., Indianapolis, Ind. Poultry raisers whose hens are not laying well should send 50 cents for a trial package (or $1 for the extra large size, holding three times as much). Don Sung is positively guaranteed to do the work or money promptly refunded, so it costs nothing to try. Right now is the time to start giving Don Sung to your hens, so you will have a good supply of fresh eggs all winter.

Supplements to a Ration

A ration for egg production must be complete. It should supply material in sufficient amount to maintain body weight and permit heavy production without seriously depleting the body reserve.

The last years have brought forth many new ideas in connection with nutrition. We have in part, at least, discontinued a discussion on feeding that is based solely on protein, fat, carbohydrates, etc., as was formerly the case. In addition to these, one must give attention to vitamins and minerals.

The old idea still persists in the minds of a great many poultry keepers that limestone grit should be supplied merely to assist in grinding the feed. Last week I saw one of many houses that was all fixed up with a nice box of gravel, stones, and other forms of false teeth for the flock.

Results from the Wisconsin Experiment Station show the following results with various forms of mineral additions. (Cir. 141)

	Eggs laid		
Mineral feed	4th test	5th test	6th test
Oyster shell (coarse)	884	761	1,364
Oyster shell (pulverized)	587	590	1,056
Clam shell (coarse)	780	619	1,255
Dry bone	450	587	814
Lime rock	515	472	846
Lime rock and potassium iodide	532	358	714
Calcium carbonate and potassium iodide	622	513	853
Calcium carbonate	439	493	745
Calcium phosphate		475	735
No mineral addition	210	388	693

One will note that the best results were obtained in each test when a coarse oyster shell was used. The contrast, however, was slight as compared with coarse clam shell and very great when compared with a finely ground or pulverized oyster shell. From this one can conclude that coarse oyster shell must be used even though a grit is supplied. The grit should, in addition, be a limestone grit.

Another misconception often encountered is that the production of soft shelled eggs comes as a result of no oyster shell. This table also tends to disprove that belief since the check pen receiving no mineral addition produced fewer eggs than the pens receiving calcium carbonate, which is oyster shell.

Soft shelled eggs may be caused by injury to a hen such as that occasioned by falling from a roost or due to fright. In such instances the egg slips past that portion of the oviduct where shell secretion normally is completed without sufficient time for complete deposit.

Hens that are extremely fat may lay soft shelled eggs and in other instances it may be a regular practice. Paper shell eggs are of course due to a vitamin deficiency.

When a flock is placed on a ration deficient in calcium carbonate, the hen will apparently deplete her body reserve and will then produce at a rate and level which the supply makes possible. A hen will not intentionally produce an egg and neglect to put on a covering if there is material from which to make the shell.

Coarse oyster shell is rather low in price and because an average hen will only consume about 3½ pounds per year, a flock owner is often led to believe that its addition to a ration is not urgent. It is or should be just as much a part of the ration as the grain, mash, or other ingredients.

Calcium chloride is common salt. The addition of this to the ration, rather than placing in a hopper, is advised. There is a possibility of an excess of salt causing a heavy mortality by poisoning.

Usually fine salt at the rate of 1% in the mash is sufficient. This means one pound per hundred pounds of mash mixture. Fine salt can be more evenly distributed and will avoid any one bird obtaining an excess. Recent work seems to show that larger amounts may be fed without seriously affecting the flock, but this amou apparently ample.

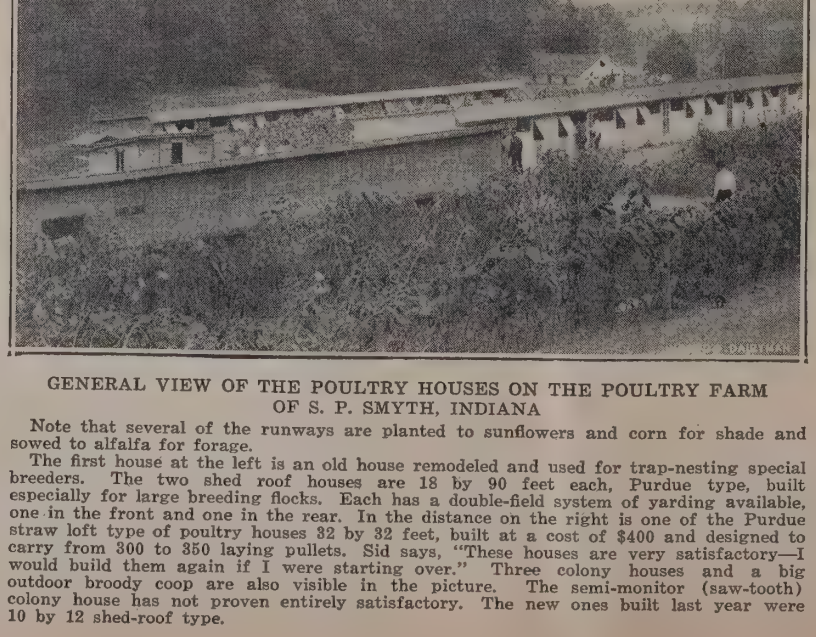
The necessity of feeding bone i pendent upon the source and am of animal protein feed. When scrap or a meat and bone meal is ed to the mash at the rate of tw per cent, it is probably unnecessar feed any bone which is, of course, cium phosphate. There will usu be enough carried in the other f When a mash is mixed with a low per cent or milk is used as source of animal protein, the add of five per cent of bone is advis

The exact amount which is requ even for chicks is not definitely es lished but the amount given wil sufficient.

The final supplement to a ratio all heavy producing flocks in northern states is cod liver oil. material is so relatively new as a p try feed that a great deal of misun standing about its uses and the to use is evident.

One controversy always enc tered is in respect to the use o fined or crude oil. This usually m the light or dark colored oil. I in this case it is impossible to definite recommendations. For a age purposes one will find or sh find that the light colored oil cont both A and D vitamins while the colored oil contains D with onl possibility of A. It is possible obtain the A from other source that an oil containing only D ma used. That is the vitamin desired required for successful winter r agement. The D vitamin makes gr er calcium assimilation or diges possible. The action is similar to obtained when the flock is expose direct sunlight.

The only assurance that one ha obtaining value in making a cod oil purchased is through the reliab of the concern dealt with. presence or absence of vitamin oil is determined by a physiolog test which means feeding to ani in a controlled ration. A chem test will not determine value.



The only other alternate for liver oil or meal is direct sunlight fact, the sunlight should be obta by open windows whenever possib

Oil is usually fed to laying hen a preventive for paralysis, p shell texture, low production, and eating rather than a corrective a these troubles appear.

The usual recommendation is per cent added to the dry mash. also fed as one pint per hundred l weekly in moist mash, milk, or t scratch feed. The way in which fed is of minor importance. Feed a reliable oil that contains the ne sary vitamins is of greatest imp tance.

Another reason for oil feeding a been advanced lately as a theory that some believe that feeding t material rather early in the fall early hatched stock will tend to p vent the false molt. The reason be of this lies in the fact that cod li oil feeding apparently keeps the fe in better physical condition, allw production to continue, and helps p vent molt.

There is always a tendency to o state any proposition and this ha part been true of cod liver oil. S people have maintained that feed this material prevented or contro worms in poultry as well as dise This is a fishy statement without definite proof. There are certain v for oil but it should not be conside as a cure-all for everything.—J. B. HAYES.

GENERAL VIEW OF THE POULTRY HOUSES ON THE POULTRY FARM OF S. P. SMYTH, INDIANA

Note that several of the runways are planted to sunflowers and corn for shade and sowed to alfalfa for forage.

The first house at the left is an old house remodeled and used for trap-nesting special breeders. The two shed roof houses are 18 by 90 feet each, Purdue type, built especially for large breeding flocks. Each has a double-field system of yarding available, one in the front and one in the rear. In the distance on the right is one of the Purdue straw loft type of poultry houses 32 by 32 feet, built at a cost of $400 and designed to carry from 300 to 350 laying pullets. Sid says, "These houses are very satisfactory—I would build them again if I were starting over." Three colony houses and a big outdoor broody coop are also visible in the picture. The semi-monitor (saw-tooth) colony house has not proven entirely satisfactory. The new ones built last year were 10 by 12 shed-roof type.

"Chicken, suh," said the old Ne sage, "is the usefulest animal der You can eat dem before dey is b and after dey is dade."

The Kansas State Herds

(Continued from page 1092)

ls. It so happens for the past il year that the only institutional l maintaining Ayrshires claims honor with a production of 19,- lbs. milk and 739.4 lbs. fat in days. This cow a grade by the , has recently finished a complete ation with a record of 23,542 lbs. and 863 lbs. fat that ranks with highest of her breed. This cow milked four times a day as were y of the other high individuals. ains are spared in the state herds roducing a winner and the com- tion runs keen every year. Uni- ly high production has been at- ed. For the past year, the rec- show 347 or 55% of the cows in ss of the 300-lb. fat mark, while ndividuals had over 500 lbs. fat to credit. It is interesting to note for the first year of the work 1—'22) only 26% produced more 300 lbs. fat.

ot the least important feature of state herd work in Kansas is the ual short course held for the state lsmen at the college. All insti- ons are ably represented, and last year saw several of the superintendents and a member of the State Board of Administration in attendance. In addition to the regular program of lectures, the problems met with in the different herds are discussed and plans made for the year's work. It affords the men in charge of the herds an opportunity of getting together and has undoubtedly proven a big asset in promoting a livelier interest and desire to do better on the part of those responsible for the welfare of the herds at each institution.

FOR SALE

CID'S CHERRY PRINCE. Dropped October 11, 1925. An excellent individual. Royally bred in prepotent lines for heavy production and approved breed type. His dam, Cid's Cherry Blossom, has a Register of Merit record of 13,576 pounds of milk and 646.09 pounds of butterfat. She is one of the best and highest testing daughters of The Imp. Cid, the sire of 46 tested cows.

His sire, Brampton's Patricia Prince, was a member of Meridale Farms' well-known show herd. He was by Viola's Bright Prince, a great breeding and show bull by Golden Maid's Prince, the sire of 60 tested daughters.

Cid's Cherry Prince is a great bargain. For price and pedigree address—

"May I Point Out One Reason Why the Ayrshire is so Popular"

remarked J. Frederick Gormley, well known artist, cattle judge and sportsman, as he carefully inspected the udder of White Dorothy, the second prize aged Ayrshire cow at the National Dairy Show.

"Every time I crawl under an Ayrshire, I am amazed at the wonderful udders that have been bred on these cattle. Such teats! Such quality, and oh the balance and shape! Never saw anything like it," added Gormley enthusiastically as he regained his feet.

You will agree with Gormley if you will just note the udders on the Ayrshires owned by breeders near you. But after all the udder is only one of the many reasons why the Ayrshire is so popular.

Write for booklets or help in locating foundation animals.

Jersey Bull Calves

We are offering at reasonable prices a few bull calves sired by Vive La France's Darling Son and out of cows of rich Sophie's Tormentor breeding. Vive La France's Darling Son is out of Vive La France, the first cow to make over 1000 lbs. fat and the cow whose average of 890 lbs. butterfat for first 6 lactation periods exceeds that of any other dairy cow. He is sired by Darling's Gallant Boy, the silver medal sire and full brother to Darling Jolly Lassie, 1141 lbs. fat as Jr. four-year-old. Two of these bull calves are out of granddaughters of Sophie's Agnes, the first Jersey cow to make 1000 lbs. butterfat.

THE GOLDEN GLOW JERSEY FARM KENSINGTON, MD.

Wisconsin State Guernsey Sale

Wisconsin Guernsey men are making a strong effort to have an annual sale that will attract Guernsey folks from near and far. The first of these sales was held November third at Waukesha; 78 animals changed hands. Most of the animals were mighty good ones and a credit to any sale ring. In many instances animals sold a bit below their value but the consignors bore the burden cheerfully. This spirit insures future successes.

The average of the sale was $291, a very creditable figure when all factors are considered. The top individual was Shoreland Katina, a seven-year-old A. R. cow from the Stevens herd. She was purchased by Mrs. Chauncey McCormick, Illinois, for $1,000. Mrs. McCormick also paid $850 for Marna's Jewel of Sun Set View, a six-year-old cow consigned by Pflughoeft.

W. A. Erbach bought Corwin Ultimas Ivan, the highest priced male, for $500. He was consigned by Rueping. The bull calf, Juvis Altimas, from the Mills herd, was second high. R. D. McLean bought him for $415.

The three largest buyers were Fort Dodge Creamery, Iowa, eight head; R. D. McLean, Michigan, nine head; and W. T. Acker, Pennsylvania, six head.

Benjamin and Love cried the sale.

Animals bringing $250 or more are:

R. D. McLean, Michigan

BROWN SWISS

Brown Swiss Bulls Mark Imprint on Grade Herds

Extra large production in a herd of grade cows may be gained by breeding with a Brown Swiss bull. They sire strong calves of a uniform type, well adapted for the general dairy farm. Mature bulls weigh between 1,800 and 2,500 lbs.

We will be glad to help you secure a Brown Swiss bull and, if you desire, a heifer or a cow.

Hoard's Dairyman Farm, Fort Atkinson, Wis.

Hunter of Kewaunee

(Continued from page 1093)

ways built of hardwood and usually in a square box or a big hogshead with poles across the top. The fish were strung on hardwood sticks and were hung crosswise of these poles. One had to watch the fire so that it wouldn't burn the fish and keep it down to a point where some smoke would roll up against the fish. Fish prepared in this way could be kept several months. Occasionally fish were salted down in half barrels for winter use. The Kewaunee River was a great source of food for the early settlers.

The muskellunge inhabited the Kewaunee River. Unlike the red-horse, suckers, and pickerel it did not go up the rapids, but came to the foot of the rapids and fed on small fish, going down to deep water during the day and coming up in the evening.

For spearing, we used a flat bottom boat. In the bow of the boat we set an arrangement known as a jack made by the village blacksmith from iron or steel where we built a pine pitch fire which lighted the river for several rods on either side of the boat. One person poled in the stern while the other fellow stood in the bow with a three-tine steel spear. Two-tine and five-tine spears were used but the finest, in my estimation, was the three-tine.

The muskellunge are very wary fish. As soon as disturbed by the light, they dash for deeper water. After several months' practice, I was able to throw the spear fifty or sixty feet with almost the precision of firing a rifle.

In the winter we caught muskellunge with a decoy fish whittled out of a little block of pine. Little pearl buttons represented the eyes, and fins were made of tin. Enough lead was run into a groove in the bottom of the block to sink it. A cord was tied to a staple. A spear having a four-foot handle attached to a strong cord was used.

Then a little light-roof house about six feet square was built to place over a hole, about two feet across, in the ice. Old carpets or rugs were put down so that one could be comfortable. With the tin fins turned just right, the decoy made a downward glide. The tail was adjusted so that the fish made a circle. A little rod about two feet long was attached to the end of the string. By making a circular motion the decoy glided around in the water very naturally.

As a rule, the muskellunge hesitated a little before coming for the bait. Very seldom could you raise him the first time. He usually came somewhat deep in the water, then you raised the decoy with the left hand while the right hand held the spear. As the decoy raised, the muskellunge usually passed on but came back within a minute or so, higher up, making a daring attempt to catch the fish. If the decoy made any unnatural move, the deception was detected immediately. When he was within a couple of feet of the surface, he was in good striking distance. With one swift move the spear was driven into the fish. Very often two or even three muskellunge were caught in an afternoon. However, like hunting and fishing one might fish faithfully for an entire day and not even see a fish.

The white man learned to catch muskellunge with a decoy from the Indian. The Indian was very adept but never had a comfortable house. He usually used a blanket or deer hides supported by bent sticks. Indians were fond of fish but, strange to say, they did not get so they could cook fish that were appetizing to white men.

SIR ROMEO MILDRED COLANTHA

We have a Few Very Nice Sons of Sir Romeo Mildred Colantha to Offer

Never defeated in the show ring, the All-American Champion bull, Sir Romeo Mildred Colantha has demonstrated in 1927 what may be expected of him in the future.
His first young sons and daughters have been shown by Carnation Farms all over the United States, winning highest honors at the leading shows. At one show his get defeated even the get of Sir Inka May. One of his sons was Junior Champion at State Fairs in Iowa, Kansas, Oklahoma and Arkansas. One of his sons won 6 firsts and a second, another son won 2 firsts and 3 seconds.
AND THESE ARE HIS FIRST OFFSPRING
The Secretary of the Holstein-Friesian Association of America is using a son of Sir Romeo Mildred Colantha on his herd.

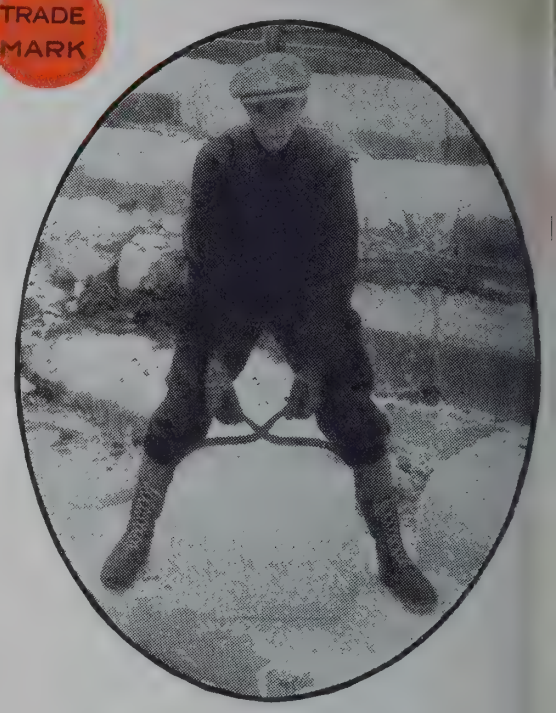
HOARD'S DAIRYMAN

A JOURNAL DEVOTED TO DAIRY FARMING

Volume 72, No. 23 Fort Atkinson, Wisconsin December 10, 1927

Ball-Band footwear also includes many styles of rubbers and galoshes for dress wear. Trim fit, smart line and long wear are built into every item—and the Red Ball is on every one.

"You can't beat them for wear"



"I have worn Ball-Band rubber and woolen footwear for about eighteen years now," says Samuel J. Millar, Superintendent of the big Briarcombe Farm, at Winona, Minnesota. He goes on:

"I first made the acquaintance of the rubbers with the little Red Ball trademark down in Pennsylvania, where I learned how much punishment Ball-Band boots will stand.

"My stock of Ball-Band rubbers now includes practically everything from light rubbers for dress wear to high top boots for hunting and fishing. For all-'round farm work I wear the heavy rubbers over my shoes. You can't beat them for wear."

Briarcombe Farm is widely known for its registered Guernsey cows and for the beautiful landscaping of its 476 acres of rolling, fertile land. Mr. Millar and his men find time for play, as well as work, as the photograph shows.

TRADE MARK

In midland Minnesota . . . on Vermont's mountain farms . . . and on the plains of Kansas . . .

Through winter's cold and wet their FEET are WARM and DRY

There's a big difference in climates in this country, just as there is a big difference in the work that men do. But these men—and millions like them—know that Ball-Band footwear stands the gaff, regardless of work or weather.

In snow and slush, in rain and mud, these rubbers and boots keep the feet warm and dry, month in and month out.

And in Ball-Band footwear you get good fit, whether it is in rubber boots worn over socks, or arctics and rubbers worn over shoes.

Good fit means foot comfort and, as every farmer knows, farm work in bad weather is much easier if the feet are not pinched or cramped or rubbed at any point.

You can make sure of getting fit, comfort and more days' wear if you ask your dealer for Ball-Band rubber footwear. Be sure you see the Red Ball trade-mark.

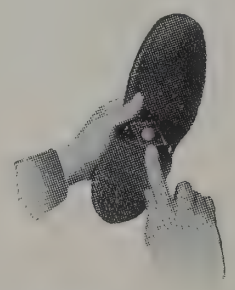
MISHAWAKA
RUBBER & WOOLEN MFG. CO.
313 Water Street, Mishawaka, Indiana

"Warm in the coldest weather"

Five years ago G. J. Perkins and his son, Charles H. Perkins, started a milk route in Brattleboro, Vermont. It is a town of only about 2000 homes, and four other dairies were already in operation. Today they boast the largest route in town, delivering over 500 quarts of milk daily. In this way they market the dairy products of a herd of 70 cows, all registered, and all maintained on their 265-acre farm.

Like his father before him, Mr. Charles Perkins, whose photograph is shown, wears only Ball-Band footwear. He has on one of the leather top rubbers. "I like it," he says, "because its rubber shoe part is just high enough to keep my feet dry at most of the work I do, and its high leather top enables me to wear a Ball-Band wool sock underneath that keeps my feet warm in the coldest below-zero weather.

"Most of our men wear Ball-Band footwear, too. I believe there is just as much difference in rubber footwear as there is between blooded and scrub bulls. For instance, one of the boys paraded a new pair of things before me not long ago that looked like my Ball-Band footwear. He boasted of the money he had saved in buying them instead of Ball-Band. They are already worn out and mine are just broken in."



"Fitted perfectly"

"Every Red Ball article I ever had, fitted perfectly and kept its shape. My rubbers do not rot or crack—only wear will destroy them, and they stand that for a long, long time."

This is the opinion of Anton Jacobsen, one of the best known farmers around Atchison, Kansas. Mr. Jacobsen combines a 94-acre dairy farm with chicken raising. He has 25 Holstein cows and 500 White Leghorns. Explaining further, he says:

"I've worn footwear with the Red Ball trade-mark for twenty years or more. I've worn many a pair of four-buckle cloth arctics for three winters and a pair of Ball-Band boots will last me for years. The rubbers that I have on are what I wear around the barn when the ground is frozen, or go to town in."

BALL-BAND

BOOTS · LIGHT RUBBERS · HEAVY RUBBERS
ARCTICS · GALOSHES · SPORT AND
WORK SHOES · WOOL BOOTS AND SOCKS

Look for the Red Ball

If you like your shoes and rubbers combined, Ball-Band makes several styles of leather-top rubbers. (See cut on extreme left.) The rubber and arctic shown are two popular styles for winter wear.

sifying Pure-bred Sires

Minnesota Holstein Breeders' tion, co-operating through the il County Holstein Breeders' tion, is undertaking a piece k in classifying the pure-bred service in the herds through- ertail County, which will mean h to the Holstein industry as dvanced Registry work did t was started through the Hol- riesian Association of America.

rtail County, since organizing ears ago, has been one of the ctive county Holstein associa- n the country. This organiza- the present time has a reputa- placing the largest number of red sires in the sire campaign county in the United States. have also been very active in velopment of the county mana- n, the promotion of boys' and alf club work, the eradication erculosis, the organization of sting associations, and in gener- licity on Holsteins. Much has written regarding classification pure-bred Holstein sires and s, and the Ottertail County rs decided that it was time to lking and start something that be done in a practcal way.

the request of the Ottertail y Holstein Breeders' Associa- committee was appointed by oard of Directors of the State in Breeders' Association to co- e with the county association in ping a practical plan that would to both grade and pure-bred The men on this committee W. S. Moscrip, V. S. Culver, Hansen, and John B. Irwin.

plan, as developed, is applica- both grade and pure-bred herds he purpose of this undertaking e briefly classified as follows: 1. fying pure-bred sires according e production and type of their ing. 2. Classifying the cows, if reeders so desire, according to 3. Giving breeders advice and stions on their breeding opera- This plan will discover the bulls of the breed through their and the type and production of daughters; it will continue in e the outstanding sires of the in as many herds as possible; t will enable breeders to secure ervice of pure-bred Holstein sires not only rate good as individuals have proven their value through type and production of their ring.

the work of classifying sires, no are classified unless they rate good, very good, or excellent. In the work, the advisors found the plan of sub-dividing each one e above classes into a minus and rating gave a better general idea e exact rating of the sires as well males, so that in reality, instead aving the four ratings, there d be twelve ratings.

e work in the classifying or rat- of sires has been completed in rtail County, a total of 13 sires 7 herds being classified.

llowing is the official classifica- schedule that determined the ification or rating of the sires in county project. In presenting classification the sires are divid- nto three divisions, and for the enience of the readers we are ar- ing this classification in reverse r to show the gradual progress he type and production of the ring are indicated.

sion C. Bulls, One Year and Over

ss 3. Bull, one year old; fair individual untested dam.

ss 2. Bull, one year old; fair individual A. R. dam, or very good individual from ted dam.

ss 1. Bull, one year old; good individual from A. R. dam, or good or excellent individual from untested dam.

Division B

Class 3. Type: Fair individual from untested dam; not less than 8 offspring, grade or pure-bred, 50% of which must rate good, very good, or excellent.

Class 2. Type: Fair individual from A. R. dam, or good individual from untested dam; not less than 10 daughters in milk, 50 per cent of which must have A. R. or cow testing association records of not less than 300 lbs. fat; and 50 per cent of all offspring must rate good, very good, or excellent.

Class 1. Type: Fair, good, very good, excellent. Records of dam: if any. Offspring: Not less than 10 daughters in milk, 50 per cent of which must have A. R. or cow testing association records of not less than 350 lbs. fat, and 50 per cent of all offspring must rate good, very good, or excellent.

Division A

Class 3. Type: Fair, good, very good, excellent. Records of dam: if any. Offspring: Not less than 10 daughters in milk, 50 per cent of which must have records of 25 per cent above A. R. requirements, and 60 per cent of all offspring must rate good, very good, or excellent.

Class 2. Type: fair, good, very good, excellent. Records of dam: if any. Offspring: Not less than 10 daughters in milk, 50 per cent of which must have records 40 per cent above A. R. requirements, and 60 per cent of all offspring must rate good, very good, or excellent.

Class 1. Type: Fair, good, very good, excellent. Records of dam: if any. Offspring: Not less than 10 daughters in milk, 50 per cent of which must have records 60 per cent above A. R. requirements. Not less than 20 daughters in milk, 50 per cent of which must have records 55 per cent above A. R. requirements: Not less than 30 daughters in milk, 50 per cent of which must have records 50 per cent above A. R. requirements; and 60 per cent of all offspring must rate good, very good, or excellent.

ROBERT GEIGER, Sec.,
Minnesota Holstein Breeders' Asso.

Effect of Sunlight on Calves

T. W. Gullickson and C. H. Eckles make the following report in the Journal of Dairy Science:

Four heifer calves were placed on an experiment at from 3 to 7 days of age. Two were confined in a completely dark well-ventilated box stall and allowed in the open only at night. The other two were allowed to run out of doors during the day and confined only at night. The ration for all animals was identical, the grain portion consisting of corn meal, corn gluten feed, wheat bran, and linseed oil meal, 3:1:1:1, and timothy hay of fair to poor quality forming the roughage. The animals were weighed every 10 days and the height at the top of the withers measured every 30 days during the 2-year period.

The animals in both lots continued normal in all outward respects during the test. All heifers came in heat when less than a year of age. The two in the "sunlight" group were accidentally bred at the first heat period. One dropped a normal full-time calf, and the other a small, slightly deformed calf, with both eyes present but blind. This condition was not thought to be due to the ration. One heifer in the "no sunlight" group was bred at about 16 months of age and dropped a normal calf. The other heifer of this group was found to have malformed reproductive organs which prevented conception but did not hinder oestrum.

From these data it is concluded that the absence of sunlight was without effect upon calves kept in darkness from the age of one week to two years. Normal reproduction also occurred.

Compare the Great New CHRYSLER "62" feature for feature

And You'll Find it Superior to Sixes of Other Makes Costing Hundreds of Dollars More

THE sweeping enthusiasm for the Great New Chrysler "62" is due to the public's recognition that it has completely upset all past ideas of what $1095 could buy in a motor car.

Here are features heretofore found only in Chryslers of higher price—features of performance, beauty, luxury, comfort, economy, safety, dependability and long life for which, in any other make, you would still have to pay hundreds of dollars more.

We will gladly turn a Great New Chrysler "62" over to you to test in your own way. Then you'll understand fully the acclaim of this sensational car which today more than ever is setting the country Chrysler-wild.

Mr. Frank Banta, of Peoria, Ill., is the owner of a highly developed purebred Holstein herd that has become widely known in Holstein circles. Records kept at this farm show that production was greatly increased after the De Laval Milker was installed. Below is a summary of their records for two years:

Milker Used	*Hand Milking*
Herd average 1926—321 lbs. fat	Herd average 1925—245 lbs. fat
2 individuals 1927—72.5 lbs. fat	2 individuals 1926—56.3 lbs. fat
3 individuals 1927—71.6 lbs. fat	3 individuals 1926—41.2 lbs. fat

Breeders and Dairymen Find the Solution of the Milking Problem in the De Laval!

THE milking problem is many sided, but from whatever angle it is viewed the De Laval Milker offers itself as the practical and desirable solution.

If production is your problem hundreds of breeders of fine cows will tell you that the De Laval Milker helps the cow achieve her maximum production, by means of its uniform, gentle action. They will tell you that its gentle action helps keep teats and udders in the pink of condition and that its dependability totally eliminates the endangering of production records through careless milking or changes in speed and action, as is often the case in hand milking.

If you are endeavoring to solve the problem of producing cleaner milk there are hundreds of De Laval users producing Grade A and Certified milk who will tell you that it is easy with the De Laval. Its sanitary features are exclusively De Laval and are added assurance of consistently low bacteria counts. Best of all, the De Laval Milker is easy to cleanse and keep sweet and clean.

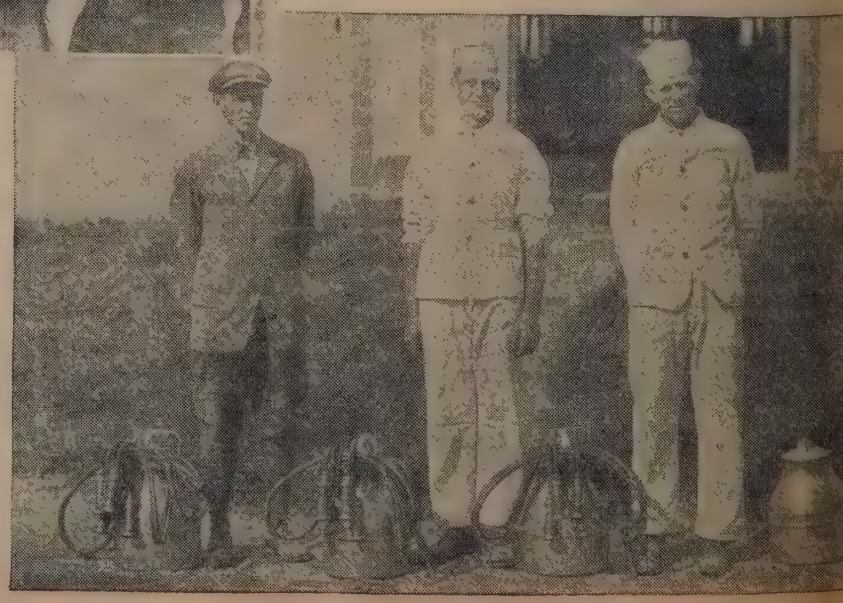
If the saving of time and labor is your goal the De Laval is again the solution to your problem, for one man with the De Laval Milker can do the milking in the same time, in a better manner and with greater ease, than can two or three men milking by hand. It gives you more time for recreation, more time for other work, and makes dairying more pleasant and more profitable.

Write for complete information, or if you prefer, ask to have a De Laval representative call.

De Laval Milker

The De Laval Separator Company

New York 165 Broadway — **Chicago** 600 Jackson Blvd. — **San Francisco** 61 Beale Street



Right: Mr. George Campbell, owner of the Cleburne Jersey Farm at Spring Hill, Tenn., and his highly developed purebred Jerseys are widely known. A De Laval Milker is used exclusively and is regarded as a necessity where better milking is required.

Below: The splendid purebred Ayrshires kept at Locust Farm, Warwick, R. I., owned by Mr. E. H. Parsons, are well known for type and production. A De Laval Milker is used with marked success.

Fair Weather Farm, owned by C. S. Fayerweather, is the home of a fine purebred Guernsey herd that is rapidly reaching a high point of development. Several outstanding records have been made by individuals of this herd recently. Fair Weather Compiegne has just completed her record in Class DDD with 10,483 lbs. of milk and 575.2 lbs. of butter-fat. When this record becomes official she should be a Class Leader taking second place and champion of her class in New York State.

FITTING THE FEED TO THE COW

A YEAR ago, beginning October 25, we published a series of nine articles on the feeding of dairy . Inasmuch as December marks beginning of several months of nuous winter feeding, we are ishing a brief summary of that s in two short articles.

n most dairy farms quite a large of the crops grown are marketed ugh dairy cows. The kinds of s grown and the way these are e have a lot to do with their ulti- value when marketed airy products.

costs money to maintain s whether they produce or much. Because of this it is important that attention be given to ling out cows not capable making a fair return for r and feeds used for r needs. The dairy herd rovement association will to eliminate this over- l cost of maintaining nterfeit cows.

uite often it is not the lt of the cow that she s to increase the values the feeds given her. metimes she is underfed, n though the feeds used of desirable kind and portion.

f cows are to return good es for the feeds they con- ue, a wage for labor, ething with which to pay other costs and a profit des, they must have the t kinds of materials to k with; their rations st be balanced according their needs.

he dairy cow uses more gh feeds and gives a ater return for them than other farm animal. The ryman who realizes this sets his farm in order to produce e quantities of the best roughage thereby built a substantial foun- ion for his feeding practice.

s a rule, the most economical pro- tion is from a ration the rough- part of which is a succulent feed a legume hay. Good roughage uld be fed to the limit of appetite. he effect of growing legumes on fertility of the soil has long been wn. This value is indirectly re- ted in the milk check because it kes possible growing more rough- on a given acreage, thereby en- ing a dairyman to feed cows he al- dy has better or he may increase herd and still feed good cows all y will eat of good roughage.

A good cow cannot do her best on d roughage alone.

The two most important functions a grain mixture are: (1) to sup- the additional nutrients required t are not supplied in the rough- e; and (2) to supply these nutri- ents in such proportion as will meet the requirements for a balanced ration. In addition to these the grain mixture should be palatable; it should be made of a variety of feeds; and it should not disturb the normal digestive process.

The two most common errors in feeding grain to cows are: (1) underfeeding of quantity; (2) underfeeding of protein.

A combination of silage and alfalfa or soy bean hay requires a grain mixture yielding about 11 per cent digestible protein; one of silage and clover hay, 12 to 14 per cent; one of silage and mixed hay, 15 to 17%; and one of silage and non-legume hay requires a mixture yielding from 18 to 20% digestible protein.

How can such mixtures be made without actually figuring them out on paper?

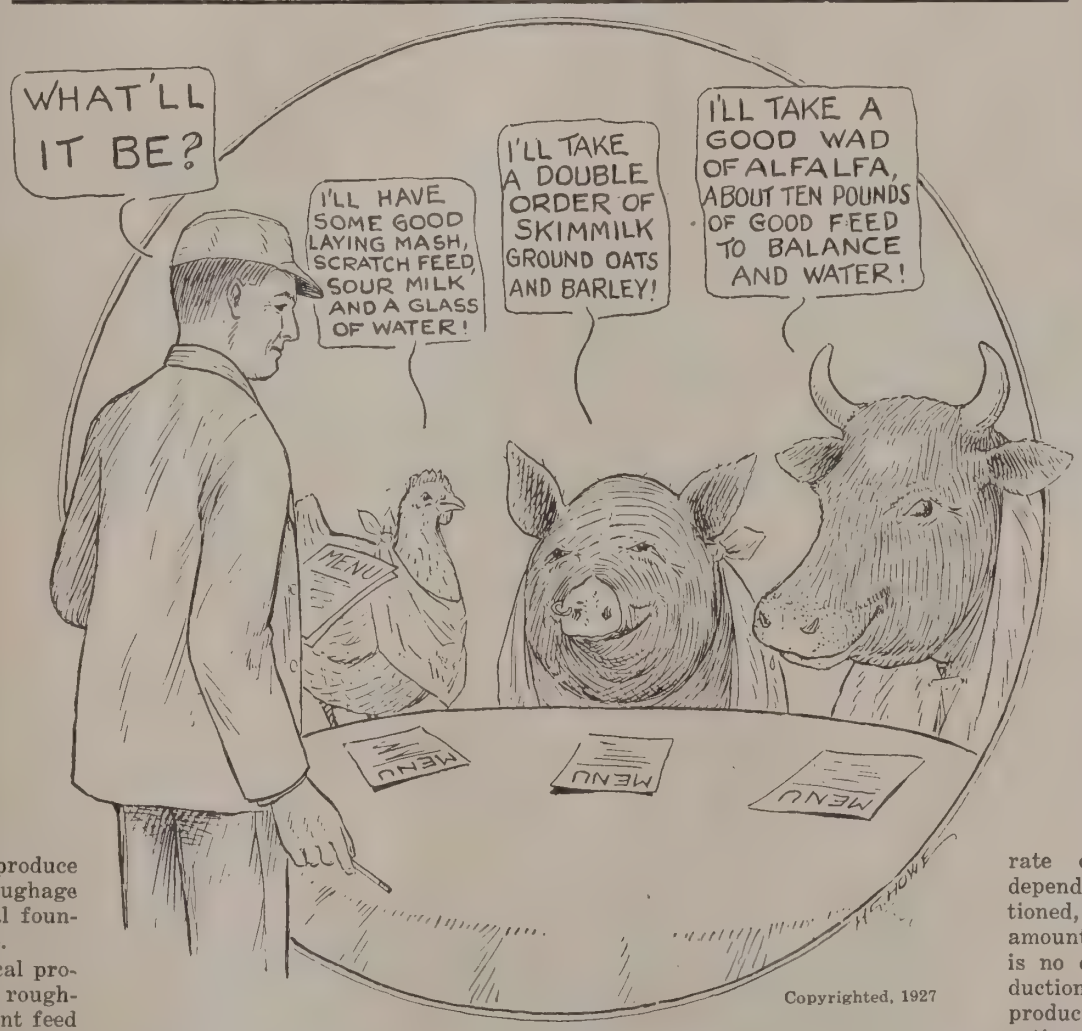
In order to get variety and with it palatability it is advisable to include in any mixture two carbonaceous feeds, two high protein feeds, and one bulky, medium protein feed. Carbonaceous feeds commonly grown on farms or available in the local market are: corn, grain sorghums such as kafir, barley, oats, and hominy feed. High protein feeds of standard quality and usually available are: linseed meal, cottonseed meal, gluten meal, gluten feed, soy bean meal, and ground soy beans. The most popular bulky, medium protein feed is wheat bran.

In addition to these are ready mixed feeds offered by the various manufacturers and made to fit the various needs of dairy farmers. In buying mixed feeds it is important to make the feed fit the roughage available.

The proportions of different concentrates for mixtures suitable to be fed with different roughages or their combinations are as follows:

Roughage combination	Carbonaceous feed	Bran	High Protein feed
	Lbs.	Lbs.	Lbs.
Silage and alfalfa hay	600	100	100
Silage and soy bean hay	600	100	100
Silage and clover hay	500	100	200
Silage and mixed hay	450	100	250
Silage and non-legume hay	350	100	350
Alfalfa or soy bean hay	600	100	50
Clover hay	600	100	100
Mixed hay	450	100	250
Non-legume hay	350	100	350

The table above is only an approximation and should be used with some discrimination. The amount of carbonaceous feed indicated in each case should be supplied from two such feeds in approximately equal amounts; it is desirable that the amount of high protein feed indicated also be supplied from two such feeds. For example, the mixture for silage and alfalfa hay calls for 600 lbs. of carbonaceous feed, 100 lbs. medium protein, bulky feed, such as bran, and 100 lbs. of high protein feed. The mixture might be made of 300 lbs. each of ground corn and oats, 100 lbs. of bran, and 50 lbs. each of cottonseed meal and gluten feed.



It is not advisable to use corn, hominy feed, gluten feed, and gluten meal all in the same mixture because all are from only one source, corn. Furthermore, all are heavy feeds and 100 lbs. of bran is not enough to give such a mixture the desired bulk.

After one has provided good roughage and has made or bought a concentrates mixture suitable to be fed with it, the rate of feeding the mixture is of considerable importance. The rule in most common practice is to feed grain to Holsteins, Ayrshires, and Brown Swiss at a rate of 1 lb. for each 3½ to 4 lbs. of milk produced and to Jerseys and Guernseys at a rate of 1 lb. for each 2¾ to 3¼ lbs. of milk produced. These rates will vary somewhat with the quality of roughage offered and with the likes and dislikes of the individual cows. A very good practice is to start in feeding grain at a rate of 1 to 4 or 1 to 3¼, depending on the breed, as mentioned, and gradually increase the amount until such times as there is no corresponding increase in production. This finds the maximum production obtainable with a given ration under given conditions. Maximum production is not always the most economical production but as a rule it is. By trying out the quantity of grain fed in the above manner one avoids both over- and underfeeding, a very important factor in the economy of production.

We have tried to make the suggestions in this article as simple and as practical as possible. We urge such of our subscribers as are interested in improving their rations to compare their present rations and feeding with the suggestions made. If, on comparison, it appears that improvement can be made, we urge that a trial and comparison be made

LOVE OF FARM LIFE BRINGS SUCCESS

D. Q. GRABILL, WISCONSIN

IVER Storstad began with the stumps and brush, left by a big lumber company, in 1917, to make a successful dairy farm near Brainard, Minnesota. Today he has a home anyone would be proud to own and happy to live in.

Iver was born in Norway with a love of the country in him. So when he came to America at the age of 21, landing at Fargo, North Dakota, he immediately got a job on a big farm. He knew just a little English, but quickly picked up more. Because of his industry, his willingness to use his head, he became the farm manager. It didn't take him long to absorb American ways, while keeping the many benefits he had from living in the old country.

When one of the big railroads was making extensions out through the West, Iver was attracted to construction work and became a foreman From this he went to the work of a locomotive carpenter, building engine cabs, in the Northern Pacific shops at Brainard, Minn., for nearly fifteen years. But the old love of the farm kept pulling him back to the soil.

So finally he left the shops for good, so he says, and bought 40 acres of stumps. It didn't look very encouraging. But Iver knew his health would be better out of doors than in the shops. His wife did her part and helped him to succeed.

"I always wanted to get out and build up a real dairy farm, making clean milk and selling it at a reasonable price. I didn't like the kind of milk we used to buy in town and thought we would be doing something really worth while if we could help other folks to have the kind of milk they ought to use.

"That was my ambition when we moved out here among the stumps. I have bought some more land since then, so we now own 86 acres of which 40 are cleared and under plow. In 1918 I began dairying with just four grade cows. Right now we are milking 23 cows but usually have a few more than that. They are all high grades. It does not pay to keep and work with a poor cow."

The Storstads are proud of their farm, so have given it a name, "Greenwood Dairy." They have made the name stand for quality in Brainard. There is a demand for all the milk the Greenwood Dairy produces. But there is no delivery to the homes. Each day Iver takes his bottles of milk into town, leaving them at five grocery stores and two bakeries, and receives 8 cents a quart. He has no deliveries, no trouble with collections.

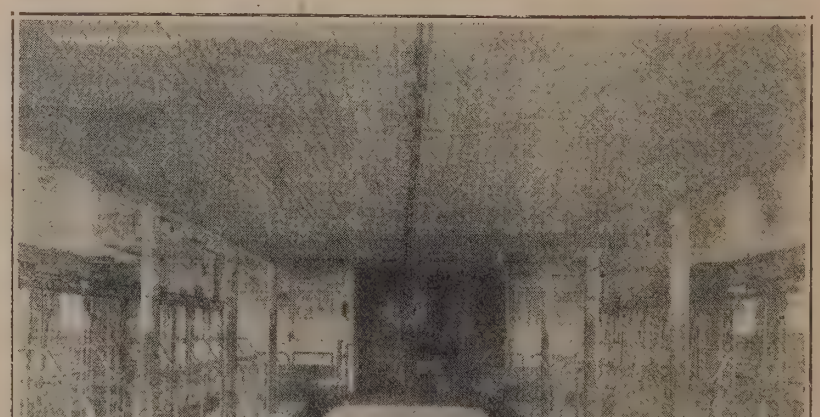
The barn and the dairy house are kept clean enough for inspection at all times. We know this is true, because no one at the Greenwood Dairy was expecting us the day we visited there. And we only wish we could always be sure of getting milk from a barn and milk house we knew to be just as clean as this one. A lot more milk would be used under such improved conditions.

The barn was scored not long ago by a representative of the Live Stock Sanitary Board at 96, which is very high. The score card used conformed very closely to the requirements of certified milk barns.

"I had some rather hard, dirty competition to begin with," says Iver, "but I had faith folks would eventually turn to a product they knew was produced under the right conditions and properly taken care of."

THE OLD BARN IN WHICH IVER STORSTAD BEGAN TO DAIRY

As soon as the milk is drawn it is cooled, this being made possible by the use of ice. There is a good sized ice house near the dairy. Mrs. Storstad takes all the care of the utensils and helps with the bottling of the milk. In fact all the work on the farm is done by Mr. and Mrs. Storstad and their twelve-year-old boy. Of course, he only helps such time as he is not in school.



Iver is a believer in using machinery and equipment wherever possible to take the place of human hands. He finds it isn't so much of a chore to do all the milking himself with a good milking machine. His carrier saves a lot of time in cleaning out the barn, in fact the young son does most of this work and does not object with such mechanical assistance.

"The drinking cups are a mighty fine thing," says Iver, "for they not only make the cows do better, but they certainly do save a lot of labor. They never take any time to care for, except once in a while to clean out. I hire no help, so have to use every way to keep down my labor."

The barn is 86x74 feet in size, completely equipped and ventilated with a modern system. "I received quite a lot of help in planning my barn from the company supplying the equipment and the system of ventilation." An 80-ton silo stands in one corner. Iver has no trouble raising all the silage he needs and could easily duce more. No doubt he will a dairy grows.

THE STORSTADS HAVE REASON TO BE PROUD OF THEIR "GREENWOOD DAIRY" FARM

INTERIOR OF THE NEW BARN WHICH IS COMPLETELY EQUIPPED AND SCORED 96 BY THE LIVE STOCK SANITARY BOARD

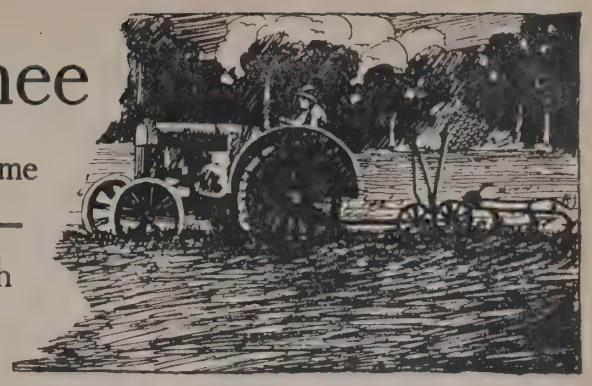
We noticed a popular make of tor standing near and asked found this practical. He said: "Y is practical for certain forms of But my soil here is not very h It is what you would call a sandy loam. I find I can plow with horses than with the tract can't plow over 4½ inches deep the tractor and I do not plow same depth two years in succe One year I may want to plow inches deep and about six inche next year. I can do that in this soil with horses, but not with tractor. But there is a lot of around the farm I use the tr for."

Iver has adopted a very good tion of crops for his land and cli He raises corn one or two years, ally one; then oats, clover, or al The second crop of clover he al turns under. He has plenty of nure from his herd, which he use erally on his land, so it is alwa good condition to produce well fact, most of our visit took while Iver was loading manure the spreader to take to the field likes to take it out every day, b course there are some seasons o year when this is not practical.

We were a bit pe al when we asked I he was making any ey. He did not he nor qualify his saying: "I certainl making some mone I have told you I only cows that can duce. I try to rai much feed as I ca the acre, and feed care for the cow they have a chan pay me well. And do.

"But to make m on the farm you ne do some things be work. You have g have a good wr desk and use it. I you must keep re and count costs on what you are d

"I have been back to Norway once since coming to this countr want to go over again before lo noticed one thing we can think good advantage in this country. we talk about how many acre have, how much of this or tha are putting in. In the old cou they try, instead, to see how they can raise on an acre.



"Until we get right down to th this country we won't improve farming much. That is the only w see that we can get hold of farm prosperity a lot of folks are ing to find. It is right here al time, if they could only see it. trouble is most of us can't see a portunity when it is right in fro us; then we think the govern ought to come along and do magical thing for us."

Iver was able to see a real op tunity nine years ago. He has n lost his vision nor his enthusiasm. dairy is not as large as some, but just as clean, just as good as any er in the country. He is sellin present 250 quarts of milk a da 8c a quart. For his cream he 50c a quart. And contrary to the lief of many, Iver says he can m money raising calves big enough veal. All of which adds to his inc

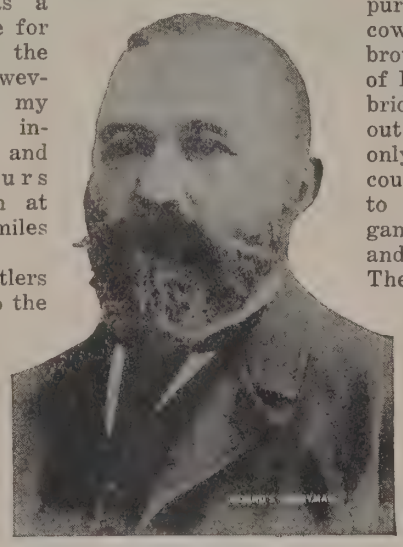
Hunter of Kewaunee

Kewaunee Gold Rush—Lake Captains Become Stock Buyers—Packing Furs to Green Bay—Matches and Early Lights—The Sugar Bush

RANSOM A. MOORE, WISCONSIN

KEWAUNEE, Wisconsin, was brought forcibly to the attention of the United States in 6 because some one found mineral embling gold there. Lands were bought and sold at fabulous prices. A single eighty acres entered from the government in September, 1836, was later sold to Solomon P. Chase by Morgan L. Martin for $38,000. However, the bubbles soon st and the wilderness surrounding waunee was not even disturbed.



ANSOM A. MOORE

n 1837 a lumber mill was built on Kewaunee River, practically on spot where I was born. This mill not prove to be a success and the perty reverted to its former own- Joshua Hathaway, who finally got Mr. Valk, of Cook County, Illinois, erested in the property, and he ved in to continue the work of ving the lumber July, 1843. On the ole, this first settlement in Kewau- County was practically a failure. was not until 1853 that my grand- her purchased this particular tract land and remnants of the old mill n are still visible. No efforts were de to reestablish this colony as the ber business proved to be a fail-, but in later years a better dam was found about a half mile fur- r up the river and a substantial m with a much better flowage is ll in existence, and a grist mill has en operated by the W. Syke Com- ny for the past quarter of a cen- y.

From a little write-up on Kewaunee quote the following:

"From 1853 to 1858, B. R. White, mes R. Slauson, Joseph and Seth oore, George Grimmer, John Metz-, Charles Brandes, Joseph Walend- Joseph Duvall, Valentine Hoffman, talis Miller, Patrick J. Roonery, arles Deda, Alfred Vibber, Fred Jo- nnes, Charles W. Dikeman, Wojta ransky, John Lutgen, Frederick hne, John Wrabetz, and many oth- came in and settled, and Kewau- began to make visible progress. waunee, however, did not become village until about April 30, 1873, the late R. L. Wing was elected t president of the Board. The city Kewaunee was incorporated April 1883, and V. Mashek was elected first mayor."

The Seth and Joseph Moore re- red to were my Uncle Joseph and my father. Of course they came in 1853, together with my grandfather and a year or two later my grandfather's family moved from Racine to Kewaunee. It was a rather hard struggle for the family during the first few years. However, my father and my grandfather were inveterate hunters and trappers and furs brought ready cash at Green Bay thirty miles to the westward.

HON. V. MASHEK, KEWAUNEE'S FIRST MAYOR

The early settlers clung pretty close to the rivers which were used as the highway for a good many years until roads could be put through. Slauson Grimmer and Company, together with a Mr. Taylor, built a sawmill at the mouth of the river and were also instrumental in helping to put in a bridge pier. This ran out into the lake for sixty or eighty rods. It was constructed by driving poles into the sand and planking over so that teams could draw material for loading the vessels. Previous to that many settlers made timber slides down which they shot their cord wood and ties to the beach. Vessels coming from the South picked them up in small boats or lighters. The mills attracted many settlers.

RESIDENCE OF HONORABLE V. MASHEK

As the early settlers cleared their land, they felt the need of live stock. They secured them through the sailing vessel crews who would agree to bring back cows and heifers. After unloading the vessels, the captain or mate went out into the country around Milwaukee and Racine and purchased the necessary cows. When they were brought up to the village of Kewaunee, before the bridge piers were built out into the Lake, the only way the cattle could be put ashore was to push them off the gang plank into the lake and drive them to shore. The cattle were marked so that every settler secured the animals purchased for him. Later, after roads began to be cut through the forests, considerable stock was driven up.

I have a vivid picture of seeing the various kinds of butter corded up on the counters of the grocery stores. The store keepers took butter, eggs, or anything the farmers produced in return for sugar, coffee, and other necessities. The butter was of all grades and colors. Some was put in prints, some in long rolls, often four or five pounds in a single roll. Some was almost as white as milk and some was a red-yellow. Butter sold at from eight to ten cents a pound, and I think it was the most expensive butter ever put on the market. It had all flavors as well as colors, and would not be eaten now by the consuming public.

For many years it was a rare thing to see a domesticated animal butchered in Kewaunee County. Settlers were so eager to get stock that they would do almost anything to secure it. However, it was all scrub stock. Feed was plentiful and hay could be secured very easily from marshes and waste places. The farmers did no systematic dairying nor did they know what it would cost to produce a pound of butter. The manufacture of cheese was not thought of except in a crude way.

The scarcity of money in the early days was felt by most settlers. The policy of the mills was to create trade for their stores. So if you labored for them, you received what was known as a due bill—a document showing that a certain amount was due the bearer in trade at the stores. This practice lead my father to devote a portion of his time to trapping for furs. It was in this way that I became a student of the forests and streams, and an inveterate hunter and trapper.

I felt that a complete knowledge of the ways and habits of the wild animals made one a master of the animal. Even at the age of ten my father and I would carry our furs to Green Bay, a city founded by the early French settlers largely to secure the Indian trade in furs. We found it much easier to take the Indian trails for a portion of the way, sliding swiftly through the forest, carrying our packs of furs and getting to Green Bay usually by noon. It was about thirty-one miles from home to Green Bay and it seemed no more hardship to go this thirty-one miles at the time when I was nine or ten years old than it is now to get up at my home and go a mile and a half to the office.

There was one settler who lived about ten miles to the east of Green Bay and we aimed to get to his place on the return so that we could easily reach home early the next morning to start the day's work.

No one ever thought of becoming wealthy and the first desire was to get sufficient to eat, drink, and wear, and if one was comfortable he seemed to be happy. The people had very few wants, and these could usually be supplied.

All people practiced rigid economy. After the introduction of matches, a person hesitated before striking a match for lighting a candle. Usually there was a supply of splints which could be put into the stove or fireplace and a light secured. Kerosene was such a price that the people did not burn lamps more than thirty or forty minutes any one evening.

My earliest recollections are of oil lights. Usually a saucer or cup was filled with bear or raccoon oil. A crude wick made of a stone wrapped in cloth burned very nicely.

Some ingenious person brought

IT is in no way belittling the Pacific International Live Stock Exposition to call it Plummer's show. Broad in its scope and excellent in its quality, it is nevertheless a reflection of the personality of O. M. Plummer, long its manager. Dynamic and always optimistic and an idealist is Manager Plummer. Progressive, optimistic, and substantially sound is his show. Time was not so many years ago when this exposition was a small affair, housed in windswept tents staked out in the winter mud of North Portland. Now instead of a show representative of the Northwest it may almost be said to be an affair truly national in its character.

Many conditions contributed to make this year's exposition set a new mark. An unusually prosperous year in the agricultural regions of the Northwest was a factor. Splendid winter weather conditions was another. Continued support by the Oregon legislature and the state of Idaho are factors. As to the weather, unusual conditions for the time of year enabled the turnstiles to click a total attendance of well over a hundred thousand to equal the mark of last year, a record up to that time. No frost had been experienced in Portland and the coast region, and with the exception of one rainy day, a succession of Indian summer days stimulated attendance from long motor distances. To the many eastern visitors the flowering streets of Portland were a surprise and a delight.

The usual number of meetings were held during the show. Owing to the illness of President E. A. Stuart, the annual meeting of the Pacific International and election of officers were indefinitely postponed. There were, however, the usual business meetings of the Holstein, Jersey, Guernsey, and Brown Swiss breeders, as well as meetings of the beef cattle, sheep, and horse men.

The annual meeting of the western branch of the American Dairy Science Association, of which Professor F. W. Atkeson of the University of Idaho was chairman, was held October 30—31. The usual dairy products display held under the auspices of this association was again a feature. A visitor of note who had a prominent place on the program was Dr. George E. Holm of the U. S. Bureau of Dairy Industry.

WALTER ANDREGG OF OREGON AND THE HOLLYWOOD CALF HE WON
The calf is held by Earl Cooper of the Holstein-Friesian Ass'n. of America. A calf is awarded annually by Harold Stimson of Hollywood Farm, Washington, on basis of animal, 25%; herdsmanship, 25%; showmanship, 25%; record book, 25%.

Following this meeting the Oregon State Buttermakers' Association held their annual convention.

Land Products Show

The Land Products Show was in every way up to its usual standard. The number of county booths was limited this year to twelve, in order that space might be available for general displays and competitions. All were from Oregon. In the county contests Jackson County, Oregon, took first place by a single blue ribbon owing to the excellence of its display of fruit. Washington County, Oregon, took second place with a very excellent exhibit that brought out the diversified nature of farming of the county. Particularly strong was the Washington County exhibit of Burbank potatoes.

In the field of dairying it was shown that Idaho in 1926 produced 36,600,000 lbs. fat, an increase from 17,600,000 lbs. in 1917. Of special interest in the exhibit was the display of Grimm alfalfa seed, of which product Idaho is the leading producer both as to yield and quality, and the display of Great Northern field beans which are one of the important cash crops of the state.

Students' Judging Contests

As usual, an important feature of the show was the student dairy judging contest. College teams from five Pacific Coast institutions engaged in competition in the judging of cattle and in dairy products. In both competitions, the young men from the University of British Columbia won first place. The dairy cattle judging team coached by Professor H. M. King scored 3,555 points and, although no members of the team w high men, the general average exceptional. Second place was wo the University of Idaho with a t only three points less than the ner's. Washington State College third with 3,466 points, Universit California was fourth, and Ore Agricultural College fifth.

Highest scoring individual jud all breeds and classes, was J. Newell, Washington State College W. McKay, University of British lumbia, and R. E. Brooke, his t mate, were second and third.

In the Smith—Hughes live s judging there were 52 teams in contest representing five st Washington contributed 22 te There were 288 participants. F place was won by the Corvallis, team, with the Bozeman, Mont., t second and Redmond, Ore., th Sherman Smith of the Bozeman t was high point winner. The men posing the winning Corvallis t were Clinton Smith, Otto Oetjan, Howard Gibson.

Boys' and Girls' Club Exhibi

More than 400 boys and girls, resenting the best talent of the a cultural and home economics club Montana, Utah, Nevada, Id Washington, Oregon, and Califor attended the exposition and par pated in the activities of Camp Pl mer. Approximately 250 exhibits live stock were made by the members whose participation ma a forward step in every phase of show with the exception of the d department. It is doubtful if the ex it of the dairy stock by the club m bers was quite equal to former ye

This year Washington took trophy, with Oregon second and ho, winners last year, third.

orn Improvement In Various States

H. H. BIGGAR, NEBRASKA

HAT is being done in various states to make for better corn and higher acre yields? A around the circle discloses fine lines of investigations in ess; an honest endeavor to v all possible light on corn prob- Some of the high points only be handled in this article.

Indiana, Dr. G. N. Hoffer states his investigations that many soils are deficient in one or more e essential plant foods. When symptoms of malnutrition are erly interpreted and the nutri- deficiencies corrected, increased s of corn are obtained. These ctions can be made by proper izers, correcting the soil reac- the drainage relation, and in ways.

. Hoffer has discovered methods sting cornstalks to determine the ent needs. The stalks selected esting should represent a majori- f those in the field and should ears well along in maturity. The s are split open lengthwise, and test solutions are used. Tests nade for nitrate in the stalk, for ssium, and for iron with the solu- . The reactions to these tests, in ection also with physical appear- of the corn plant and its parts, the necessary information.

Illinois, work along corn im- ement lines is being carried on at experiment station at Urbana also at Bloomington. The work oomington is under J. R. Holbert e U. S. Department of Agricul- Mr. Holbert co-operates also the experiment station. In Illi- the work in general has been ; corn disease lines. Inbreeding crossbreeding have been and are used in the development of ns resistant to disease and high ield. The Illinois investigators that the greatest improvement be expected to accrue not from ical selection of the ears alone, also from continuous practice of selection and selection on the germinator, always beginning with a strain which has possibilities for improvement.

One of the lines of work which Mr. Holbert has been carrying on is the investigation as to the leaning and lodging of corn plants. All corn growers are familiar with the fact that in any field there are big differences in the fall with regard to the plants being upright, leaning, or completely fallen over. Mr. Holbert in this work has been making use of a pulling machine which shows the differences in the pulling resistance of various plants. He has found that where corn follows corn consecutively for several years, the percentage of leaning stalks is greater than where it follows virgin sod or a leguminous crop. There was an increase in the percentage of leaning stalks where corn was infected with diplodia. Erect strains of corn plants were found to have about twice the root systems of plants which were leaning or lodged.

EAR-TO-ROW BREEDING IN OHIO. WEIGHING THE YIELDS FROM EACH ROW

At the Wisconsin Station, B. D. Leith of the Agronomy Department has been carrying on some interesting work with regard to developing corns for the more northern regions. He studied the problem of germination at 42 degrees F. and selected out lines germinating under such temperature conditions. Field selections have also been made from individual plants showing the greatest resistance to cold weather. Mr. Leith states that thousands of acres of cold-resistant corn, developed through selection, are now being grown in the northern and central portions of the state and that the behavior of this corn is superior to the ordinary varieties grown. The selection work was done with the well known Golden Glow corn.

A VIGOROUS ROW, THE RESULT OF BREEDING FOR RESISTANCE TO DISEASE

At the Virginia Experiment Station, Agronomist T. K. Wolfe has been doing some interesting work in the crossing of varieties. In a cross made between Boone County White and the earlier variety, Silver King, a hybrid was developed which yielded seven bushels more than the former and 10 bushels more than the latter. A strain, V. P. I. Prolific, represents a cross between Cocke's Prolific and Virginia White Dent, which yields more than either of the parent varieties.

In Nebraska, the investigational work with corn by T. A. Kiesselbach, plant breeder at the experiment station, has been along many lines. The most thorough work undertaken anywhere in the study of freezing injury to seed corn has been made here. The tests show that there is a direct rela-

Obtaining Money From Intermediate Credit Banks

EDWY. B. REID, WASHINGTON

OW does a dairyman, when he needs money to purchase cows, a bull, or young stock, go t it to get the money from the mediate Credit Bank?" I recent- ked J. A. Rickert, vice-president general manager of the bank at Paul, which serves the states of esota, Wisconsin, North Dakota, Michigan, a good dairy territory. t this question to Mr. Rickert in- l of some managers of the other n banks because his bank now the largest number of agencies counting with it and also the st number of rediscounts.

hat's a simple matter," he re- . "If you are going to ask as questions as that I'll be glad to the 'ask me another' game with all the afternoon. All any dairy- living in these states has to do write to the Federal Intermedi- Credit Bank, St. Paul, Minn., tell- is that he wants to get a loan on lairy stock which he now owns or which he wishes to purchase, we will put him in touch with ocal lending agencies which re- unt their dairy and other agri- ral paper with us. There are t 120 such lending agencies in esota, Wisconsin, and North Da- so the dairyman should not find it difficult to get in touch with one or more nearby. You know we've already lent about $21,000,000 through these agencies and we now have outstanding about $6,600,000. These represent loans on dairy cattle, beef and range cattle, sheep, and general agriculture.

"Many farmers have the idea that we lend directly to farmers. That is a wrong impression. We don't. The Intermediate Credit Banks lend directly to farmers' co-operative marketing organizations. There are not so many of those but that we can deal with them directly, but it would be physically impossible for a bank located in any one city to be able to pass upon the collateral offered by individual farmers over four states. Besides, the law would not permit it. So we advance the money to agricultural credit corporations, live stock loan companies, and in some instances banks. These are all in a position to look up the farmer and his collateral and pass judgment upon the loan. We, in turn, give close attention to the personnel and financial condition of the agencies which offer us the farmers' paper and ask us to advance them the money on it. So the farmers, whether they are dairymen, feeders, or general farmers, get the Intermediate Credit Banks' money, and usually at lower rates of interest and for a longer period than they can obtain it elsewhere."

The other day I travelled about the country adjacent to the Twin Cities talking with dairymen who had obtained loans which had been rediscounted with the Intermediate Credit Bank of St. Paul. To a man, I found them well satisfied with their loans and feeling that they had done a good stroke of business. Not all, of course, had borrowed to buy more stock, although that seemed to be the main reason for borrowing. Where the farmers had the feed or pasture, the additional stock were gradually paying for themselves, where mature cows had been purchased; young stock was being grown at a minimum of expense.

I found that one dairy credit corporation has more than a million dollars loaned to farmers of Minnesota and that three-fourths of it is on dairy cattle. This one agency says it expects to have out four or five million dollars in the next few years and I have no doubt of its ability to serve the farmers of the state to that extent. Other agricultural credit agencies will likely expand in proportion, for there seems to be an increasing pressure for country banks to put their money into industrial securities of one kind and another, and the city banks don't want to bother with "barnyard stuff." The Federal Intermediate Credit Banks, however, are so constructed as to be able to take all of the sound more than six months' agricultural paper that is offered to them. It is for these and other reasons that we may expect to see this type of lending agency become an increasing factor in financing farming.

The practices followed in making loans on dairy cattle vary somewhat with the different agencies, but in a general way they follow the same lines. In some instances a farmer or dairyman wishes to borrow the full purchase price of several head of cows. If he has other collateral than the new cows, so as to afford the credit corporation the desired protection, he may frequently borrow the entire purchase price. Of course, the lender also looks to the man's farming ability, financial statement, and

SWEDISH COW TESTING ASSOCIATIONS

Guy A. Peterson, Wisconsin, and Ivar Johansson, Sweden

THE cow testing association idea, which was born in Denmark in 1895, was brought to Sweden in 1898 by that leader in the field of animal nutrition, Nils Hansson. The first of its kind in America was organized in Michigan in 1906. Sweden, therefore, has an eight-year lead on the United States in the adoption of this splendid type of dairy improvement. She now has about 10 per cent of her cows in testing associations. This compares with 20 per cent in Denmark and less than four per cent in the typical dairy sections of the United States. In some of the dairy counties in Southern Sweden, however, as high as a third of the cows are being tested. On the other hand, very little is being done in this respect in sections where dairying is not on a high plane.

In 1924 Swedish cow testing associations received $40,000 government aid, approximately $4.50 for each herd on test or 22 cents per cow. Of this sum, the national government provides one-third and the counties two-thirds. In the smaller, new associations of 250 cows, the government pays practically all the costs of testing. The large associations after three years are practically self-supporting. The net cost to members runs from 50 cents to a dollar per cow per year, but under special conditions it may be more or less.

Sweden, like Denmark, is a dairy country, the main difference between the two being that Denmark has a much larger number of cattle in proportion to her population than has Sweden. Each country has between 2.6 and 2.7 million cattle. Denmark, however, has only 15,000 square miles of territory while Sweden has nearly 174,000, or about three times the area of Wisconsin. Though but 14 per cent of her land is tillable, the large forest plantings bring her percentage of productive acreage up to 64 per cent. This compares to 69 per cent arable land in Denmark, and 33 per cent in the United States. Sweden has 6 million inhabitants while Denmark has but 2.8 million. That makes the number of cattle per 1,000 inhabitants in Denmark 793, United States 620, and Sweden 436.

Because of Sweden's large industrial population her butter export is small compared to that of Denmark, but the average production per cow in the testing associations is about the same in the two countries.

Sweden has only dairy breeds but Denmark has some Shorthorns, though the number is small. Some 25 years ago there were a few Shorthorns in Sweden but, as they were mainly of the beef type, they were found to be such poor milk producers that there is now not a single pure-bred herd left. About 50 per cent of Sweden's pure-bred cows are Ayrshires, this being by far the most popular breed in that country. These Ayrshires differ a great deal from those in America and England, for in reality the breed is not a pure Scottish Ayrshire, but a Swedish one with much Ayrshire blood in it. It was founded in the period between 1845 and 1900. The farmers like the breed the way it is, so it is not probable that they will want to change to the more generally recognized Ayrshire type. The cows are medium size, hardy, with good milk producing capacity and they are quite uniform in conformation and color—chestnut red with white markings.

The black and white Swedish breed of Holsteins, founded on imported cattle from Holland and Friesland, are second in numbers. They occupy the best farming districts in the South. In addition there are three native breeds; namely, the White Polled, which is a mountain breed prevalent in the North; the red and white, a breed somewhat heavier than Ayrshires, carrying considerable Shorthorn blood, kept mainly on the larger farms in central Sweden; and the Red Polled breed, which is of less importance.

Why Not in These United States?

In Sweden, no bull can be sold for breeding purposes at any official sale or awarded government prizes unless he has back of him complete production records for all females in his ancestry for three generations.

To gain registry in pure-bred associations, each animal must be backed by a production record. An Ayrshire female cannot be registered until she is at least three years of age and has given indication that she will produce 242.5 lbs. fat in a three-year average. A more complete and detailed discussion of the Swedish registry rules will appear in a later issue of Hoard's Dairyman.

Organization of Cow Testing Associations

Sweden is divided into 24 counties or "lan," each of which is a unit itself as far as the supervision of t cow testing work is concerned, associations do not cross county lin Counties that have 30 or more as ciations employ a college trained m to supervise the testing. When the are less than that number the sup vision is carried out by the cour adviser in dairying, a man who serv in much the same capacity as d the county agent in America. M Swedish counties have such an viser. The supervisor visits ea tester at least once a year, and special reasons are reported makes extra inspections.

Each association has a preside and secretary-treasurer. The offic employ the tester, but he must approved by the county supervis The minimum educational requi ments for a tester are: a first ha knowledge of farm practice, at le 5 months' theoretical training in agricultural school, and, in additi a six weeks' course in testing.

In 1924 there were 565 cow test ing associations in Sweden, wit 8,713 herds containing 185,026 cow on test. This is 10.6 per cent o the 1,750,000 cows in Sweden The average production of a cows in the associations was 7,09 pounds milk, 3.54 per cent fat, 25 pounds fat.

In the county of Malmohus Sweden, one-third of the cow pop ulation is on test, their averag production being 295 pounds fat.

Rules Given by Agricultural Boa

The general rules for the cow te ing work are given by the board agriculture. Save for minor diff ences in some counties the work carried out in the same way all ov the country. According to these ru the tester has the following duti

1. Weigh the feed given to the mi ing cows each testing day and figu it into feed units. All production based on feed units reduced to t equivalent of 2.2 lbs. barley.
2. Give the dairyman advice feeding in accordance with the p duction of the cows.
3. Weigh and test the milk fr each individual cow.
4. Mark the new born calves the ear with their mother's sta number, or see that the owner ma them in the right way.
5. Keep a record of the testing sults obtained.
6. Send a report to the county pervisor when the testing year

Cow Mothers Pigs

HOARD'S DAIRYMAN:—Two little gs, left motherless last spring, now gularly milk "Evey," a Jersey cow the farm of Mr. Albert Griffin, onnecticut.

The mother of these little pigs died hen they were only two days old.

JERSEY COW, EVEY

an attempt to save them, Mr. Grif- rigged up a nursing bottle for em, but after a few days they re- sed to take any milk from it. They oked well and did not seem hungry. e was frankly puzzled.

The next day he watched them ore closely. It was then that he st discovered them milking the rsey cow.

Today the pigs and "Evey," their dopted mother, are the closest of iends.

Massachusetts. J. H. FRANDSEN.

Bull Associations

The ultimate goal of the bull asso- ation is better cows.

The co-operative dairy bull associa- on is a farmers' organization whose ief purpose is the breeding of bet- r dairy cows through the joint own- ship, use, and systematic exchange prepotent pure-bred dairy bulls of gh-producing ancestry.

The first bull association in the nited States was organized in Mich- an in 1908. There are now 248 bull sociations in 33 states.

A study of the records of the ughters of bull association bulls owed an average yearly mature oduction of 8,071 pounds milk and 2 pounds fat. In milk production e daughters excelled the dams by .5 per cent and in butterfat produc- on by 14.4 per cent.

Some of the sires are very out- anding. One sire was mated with ws having an average yearly milk oduction of 9,300 pounds and an av- age yearly butterfat production of 7 pounds, yet his seven daughters om these cows excelled their dams 57 per cent in milk production and 44 per cent in production of but- rfat.

In many localities the banks are lping to finance the purchase of tter dairy sires. One bank helped finance the purchase of bulls for vo bull associations.

Through the system of transferring lls from block to block, the bull as- ciation makes it possible to keep all oved bulls as long as they live or e fit for service.

The state agricultural colleges and e Bureau of Dairy Industry of the nited States Department of Agri- lture will furnish information re- rding the organization of bull as- ciations.

In answer to the question, who ould join a bull association, every airyman is a prospective member. he bull association is adapted to very locality and to dairy herds of l sizes.

The typical bull association con- sts of five blocks to each of which he bull is assigned. All the bulls are wned by the association.

In a bull association the bulls must ll be of the same breed.

Much progress has been made by selecting bulls on the records of their dams and grandams. The most rapid progress can not come until dairy sires are selected on the production records of their daughters.—Farmers' Bulletin 1532.

FARMALL Plowing and Belt Work Simply Can't Be Surpassed!

THERE is enthusiasm for the work of the FARMALL wherever this perfected tractor appears. On all crops, on all jobs in field and barnyard, it shows the power farmer *something new in handling and efficiency.*

Plowing is one of its strongest suits. The FARMALL owner goes out to tackle that once-dreaded job with interest and good humor. He has learned that FARMALL and its plow will move handily and rapidly over the fields and leave well-turned furrows behind, in ideal shape for the operations and the crops to follow.

On belt work it is the same. We have dozens of positive letters from owners. D. M. Hastings of Atlanta, Ga., writes, "You deserve a pat on the back for the FARMALL. Please do not thank me for this as it is well deserved." He has used his FARMALL on every kind of work including many belt jobs.

Remember that the Harvester engineers devoted several years to working out this *all-purpose, all-crop, all-year design.* They tried out thoroughly *every* type of design. When FARMALL was *right for all drawbar, belt and power take-off work* they offered it to the farmer. The FARMALL is *the one all-purpose tractor that plants and cultivates, too.* It is the feature of power farming today.

Begin by asking the McCormick-Deering dealer where you can see a FARMALL *on the job*

INTERNATIONAL HARVESTER COMPANY
of America
(Incorporated)
606 So. Michigan Ave. Chicago, Illinois

. . . And next spring your FARMALL will be all ready to go at the PLANTING and CULTIVATING jobs. It's that kind of a tractor!

Some Farm Essentials

HOARD'S DAIRYMAN:—It takes more than mere acres of land to make a modern farm. The land is fundamental but there are other essential elements. Millions of dollars are invested in farm buildings for the accommodation and shelter of the farm families, their stock, machinery, and products. Without these buildings there would be little food available for the support of the nation. The buildings if brought together would require an area equivalent to the space occupied by New York City, Chicago, Philadelphia, and Detroit.

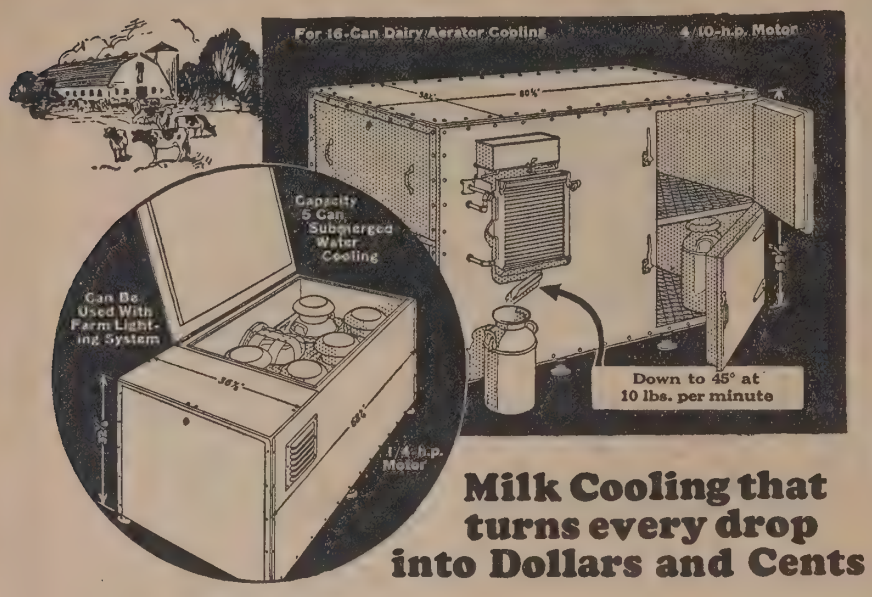
Statistics are important signals in farm operation. They vary in kind and cost from unofficial surveys to the most elaborate cost-accounting studies, but all show the dangerous condition of agriculture in which occupation a third of our people are engaged.

Facilities for replenishing the fuel, feed, and water supplies required for family and live stock use are established on over six million farms. The bins and buckets used in this connection are great in number. Water tanks by the million are in use winter and summer. In many localities expensive dipping tanks are maintained. Artesian wells and extensive conduits are numerous.

The costs of providing such essential facilities, of keeping them in repair, and of enlarging or replacing them from time to time are among the principal items of expenditure by the farmers. It costs not less than a third of a billion dollars a year to keep buildings in repair, still more to keep up the supply of farm machinery, while the upkeep of soil fertility would no doubt cost a yet larger figure, but it is not being done.

The farmers must continue to make large expenditures for the upkeep and modernization of their property to keep in advance of the ever growing demands for food and clothing. Consequently the earning power of the farms must always be such that the money needed in maintaining agriculture will always be steadily forthcoming from creditors and investor operations. This means that the support must come out of the revenues ultimately. The benefits to the public of good agriculture depend largely upon farms.

Constructive criticisms concerning farm incomes are invited.



Wisconsin. B. H. HIBBARD.

Another Holstein Produces 1000 Lbs. Fat

The latest 1000-lb. butterfat producer is Bess Finderne Mooie Fayne a 7-year-old Holstein owned by the Fred F. Field Holstein Trustees, Massachusetts. Her 365-day record recently reported by Superintendent Gardner is 27,843.2 lbs. milk, 1,007 lbs. fat (1,258.76 lbs. butter.) She is the 115th Holstein cow to enter the 1000-lb. list.

The cardinal principle in the dairymen's creed is cleanliness.—ROBERT MCADAM.

Now! You Can Insure Your Milk Profits

Milk Cooling that turns every drop into Dollars and Cents

Dairy farmers are now adopting the same resourceful methods to safeguard their milk output, as is evidenced in the conduction of other successful industries.

The market price of milk is regulated by the law of supply and demand, which is the case with many other commodities produced by mills and factories. Therefore, manufacturers employ every available labor-saving device to insure more efficient production, saving both time and money, and thereby developing a new source of profit.

Following the same principles in the handling of their milk, dairy farmers are now increasing the size of their bank accounts through the savings made possible by the adoption of modernized methods for cooling milk, putting an end to spoilage and the resultant rejections at receiving stations.

Nizer-Kelvinator Electric Milk Coolers Insure Your Profits

They are made in two sizes, fitting the need of large or small dairy herds—16-can capacity aerator type, and 5-can capacity submersion type. Both have established their efficiency and dependability for profitable operation under the most exhaustive tests while in actual use on dairy farms. Require no mechanical knowledge to operate—are entirely automatic. Easy to own and within reach of every dairy farmer. Scientifically and soundly built to last a lifetime. A one-time investment that insures profits for all time by correct cooling temperature; turning every drop of milk into dollars and cents.

Learn today, how Nizer-Kelvinator Electric Milk Coolers will insure your milk profits. Ask your milk dealer; he will advise you and can supply you. Or, mail the coupon below today for illustrated folder giving full details.

FARM RADIO SERVICE

S. R. WINTERS, Washington, D. C.

BEGINNING October 3, 1927, and continuing through April 30, 1928, the United States Department of Agriculture will utilize approximately 100 commercial broadcasting stations for the distribution of timely agricultural information to a nation-wide audience. This purely informative radio service consists of 11 distinct features and at least 12 scientific bureaus will contribute authentic data in the preparation of the material,.

Departing from the policy of 1926 in concentrating on the presentation of a few subjects, this season's farm radio service will embrace practically every phase of agriculture and much of the information broadcasted will be of interest to the city dweller as well as the rural listener. At least six features will make a bid for the favor of residents of towns and cities and their suburbs. These services are as follows:

"Housekeepers' Chat," in which "Aunt Sammy" will discuss homekeeping, meal-planning, marketing, home furnishing, etc.; "Poultry Chats," a ten-minute weekly program of interest to townspeople in that practical information will be imparted on chicken raising; "Young Folks' Program," a feature inviting the attention of children in city as well as country because "Uncle Ab" will tell stories of birds, trees, and flowers; "Chats by the Weather Man," a subject of universal appeal which will be presented by meterologists of the Weather Bureau; "Insect and Wild Animal Allies and Enemies," a feature which will give residents of cities an insight into the control metho of injurious pests and means of pr tecting wild life friends; "Primer f Town Farmers," is a program inten ed to interest town farmers who wa information on gardening and oth phases of country life.

The two overshadowing services exclusive interest to farmers a "Noon Farm Flashes" and "U. S. R dio Farm School." The former occ pies a ten-minute period as a que tion and answer service, where "County Agent Robbins" is bombar ed with farm topics that perplex, farmer with a friendly personali being the inquisitive person at t microphone. The dialogue betwe the county agricultural agent and t farmer will shed light on problems poultry keeping, dairying, live stoc crops, soils, fruits, vegetables, t farm woodlot, and marketing fa products,.

The "U. S. Radio Farm School as the term implies, is an agricultur college of the air and farmers at t plow handles and in fields and gra aries are the students. This is a co tinuation of one of three most pop lar radio services of the Departme of Agriculture last year. The su ject matter, however, will be vari gated so as to include crops and soi farm economics, and community li as well as dairying and live stock two subjects which received exclusi consideration last year. Lessons this school of the air will be present in popular form; interested farme questioning specialists who present t information in an entertaining manne

Farmers, and city dwellers as we

A KANSAS FARMER RECEIVING MARKET REPORTS FROM THE FIRST "AGRICULTURAL COLLEGE OF THE AIR," CONDUCTED BY THE KANSAS STATE AGRICULTURAL COLLEGE

SAM PICKARD, FORMER CHIEF OF THE RADIO SERVICE OF THE U. S. D. A., AND NOW SECRETARY OF THE FEDERAL RADIO COMMISSION, POINTING TO THE FACT THAT RADIO IS A DOMESTIC UTILITY TO ONE MILLION FARMERS

ho are in tune with the 1927—1928 idio services of the Department of griculture, will frequently be nused and entertained as well as istructed. For example, if radio reeiving sets were broadcasting stations there would be a chorus of a illion guffaws when the Bureau of nimal Industry gives instructions in orseshoeing by radio, and a meatutting demonstration by the same edium will undoubtedly excite a ave of laughter over the country. eriously, both of these demonstrations are intended to be informative.

"Aunt Sammy," who is Miss Jephine Hemphill of the Radio Service f the Department of Agriculture, ill continue her extremely popular eature of last year, namely, "Housekeepers' Chat." In fact, this is Service No. 1 and will be broadcast four ays each week to millions of women city and country. These are ritten in an informal, refreshng style, and contain brief discusons of home-keeping, meal-planing, marketing, cooking, canning, stablishing good food habits in children, sewing, home furnishing, decration, gardening, and kindred subects. As the first edition of the 927—1928 "Aunt Sammy's Radio ecipes," the Department of Agriculure has authorized the printing of 5,000 copies. This enlarged cook ook contains 70 menus and approximately 300 recipes tested by the Bureau of Home Economics. These ook books are free upon request.

Unique perhaps is the attempt of he Department of Agriculture to aunch a farmers' weekly radio newsaper, which undertaking solicits the o-operation of 100 commercial roadcasting stations in distributing urely agricultural news. Entitled Farm News Digest," this service, roadcast during a seven-minute period on Saturday, is a summary of farm news of special interest to agriculturists and others interested in American farm problems and methods. The news thus distributed will be taken from the releases of the Press Service of the Department and its dissemination will be speedier than by other mediums, not excepting telegraph and airplane. "The Agricultural Situation" is the title of a service similar to "Farm News Digest" in which the various bureaus will give a bird's-eye view of farming as noted in collective form by thousands of crop reporters scattered throughout the United States.

The Radio Service of the Department of Agriculture, pending the selection of a Chief by the Civil Service Commission, is under the direction of Nelson Antrim Crawford, who is also head of the Press and Publication Services. The radio staff consists of Miss Josephine Hemphill, Solon R. Barber, and C. A. Herndon. Announcers at the commercial broadcasting stations who participate in the "U. S. Radio Farm School" have been dubbed "radio schoolmasters" by Secretary of Agriculture William M. Jardine, who estimates that more than 1,000,000 farmers own radio receiving sets.

Without owning or leasing a broadcasting station, the Department of Agriculture has received approximately 100,000 congratulatory letters during the past nine months. These applause messages have not been prompted by the musical strains of "It All Depends on You" or "Me and My Shadow," but they were inspired by a purely informative radio service, varying in subject matter from a prescription for a sour soil to how to raise rabbits. Farmers sought help in eradicating weeds, improving baby chicks, combating live stock diseases, feeding, breeding, and care of sheep, beautifying the home grounds, and raising turkeys.

Calcium Arsenate Controls Alfalfa Weevil

The alfalfa weevil, which now occurs in several states of the Great Basin, sometimes destroys an average of one-half of the first cutting and nearly all of the second cutting of the alfalfa crop, says the United States Department of Agriculture. Although the weevil feeds upon a large number of plants of the clover family, it is not known to damage any crop plant other than alfalfa.

Attempts to control the weevil have consisted principally of quarantine measures, the importation of foreign parasites, and direct methods of preventing damage to the crop. The most dependable means of control known is to spray with calcium arsenate. The only safe course is to be prepared to spray the alfalfa when its condition shows that it will fail to reach maturity without protection against the weevil.

The best time to spray is several days before the feeding of the larvae reaches it height, when conditions for poisoning them are favorable. There is, however, no way of forecasting this turning point in injury. Careful watching of the field, coupled with experience, is the only safe guide to the best spraying practice.

Further details are given in Farmers' Bulletin 1528-F, The Control of the Alfalfa Weevil, a copy of which may be obtained upon application to the Department of Agriculture, Washington, D. C.

Mrs. O'Rafferty: "I hear he is a philanthropist."

Mrs. O'Flannigan: "Yes, he offered to will $100,000 to the widdy of the unknown soldier."—Exchange.

Get more out of your light plant

For every make of plant

You can have plenty of lights and plenty of power—all the convenience your light plant was built to give—if *you* give it strong dependable Universal "Nu-Seal" Batteries to work with.

Less care—long life

Big sediment space, visible charging gauge, extra thick plates, fewer fillings—all this saves you trouble, insures long life. "Nu-Seals" cost you no more now and much less in the long run.

For EVERY plant

These batteries—the *original* sealed glass cells—are made in every size and capacity for every light plant ever sold!—Yours! Any!

Battery Guide FREE

Big free book that tells you how to care for all batteries. We make farm light, radio and auto batteries for *every* purpose—this book gives you our expert advice. Send for it. And remember there's a good trade-in allowance on your worn-out batteries. Ask for it—today!

Raise MONEY-MAKING Crops!

THIS MARVELOUS NEW SPREADER WILL HELP YOU DO IT

Saves Time. Saves Work. Brings Bigger Yields. Read the Facts in a Valuable Book—"New Profits" —Now Offered Free.

HERE is the new SUPERIOR Black Hawk Spreader. It has an amazing record for making extra profits for the farmers of America. It helps them produce bigger crops, better crops. It helps reduce fertilizer bills. It saves time, work and expense. But read what John L. Strickland, Riderwood, Maryland, says:

"Your Superior Black Hawk Spreader saved me considerable in commercial fertilizer bills, as the manure spreads more uniformly and goes farther. By using this spreader I have cut down my labor expense."

It Will Make Money for You

Old ways of spreading manure are slow and costly. A spreader that has seen its best days is a never-ending source of trouble and expense. Adopt the *new* way —a SUPERIOR Black Hawk—and you'll save labor, time and money. It's *one* spreader that more than pays for itself with the money it saves and earns.

Revolutionary Features

See the SUPERIOR Black Hawk at the nearest SUPERIOR dealer—or in operation on some neighboring farm.

Note the lighter draft. That's because of few moving parts and Alemite lubrication. As Raymond Kadel writes, "It's the best spreader on the market for light draft. One horse can pull this spreader and it's the most even spreader of them all."

Note how it's built for quick and easy loading. Carl W. Jenny, Grove City, Iowa, tested his SUPERIOR Black Hawk with three other spreaders. He says, "It took bigger loads than any of the rest and it's easier to load. It spread more evenly and went farther on the least horse power. It's the best spreader on the market."

Note the automobile type mounting in front to give a shorter turn. And that isn't all.

No Other Spreader Like It

The SUPERIOR Black Hawk completely pulverizes every particle of the manure. It spreads it over the field in a broad, smooth layer. No part of the field gets too much. No part gets too little. All of it becomes available as plant food. And how crops grow! This is the most effective method of fertilization known today.

Biggest Value for Your Money

The SUPERIOR Black Hawk not only does quicker work and better work, but it lasts longer. *It's built to last.* It's made to give you more years of service. But see the SUPERIOR Black Hawk at your dealers. Compare it part by part with other spreaders. You'll see why this new SUPERIOR Black Hawk is the choice of farmers who are seeking ways to save time and work and get bigger crops and bigger profits.

In the meantime, mail the coupon for free book "New Profits." Do it now.

EDITORIAL COMMENT

MILK proteins are perfect proteins; milk sugar is a most wholesome food and milk minerals are very essential. As the Department of Agriculture says: "The use of dried skimmilk results in a product highly superior for bread-baking purposes. When used with good flour, it is possible to get a loaf 10% larger and about 4% heavier than without it. An even more desirable advantage is the fact that the skimmilk adds greatly to the nutritive value of the bread, as well as to its flavor and physical characteristics."

The several companies attempting to extend the use of powdered skimmilk in the manufacture of bread are rendering a good service to the dairy industry and to the consumers.

On dairy farms where the milk is separated skimmilk should be used in the making of bread. What we need is a better understanding of this product and its value in the human diet.

MEETING DEMAND FOR MILK

How to meet the demands of increased consumption of milk in this country without enlarging our national dairy herd or otherwise increasing the costs of producing milk is a problem of considerable economic importance to dairymen everywhere.

The per capita consumption of milk has increased from 43 gallons in 1920 to 53.3 gallons in 1926, while the population has increased nearly 2,000,000 persons a year. For each year's increase in population we need an additional 440,000 cows or the equivalent of their production from the cows we now have. On January 1, 1926, there were 330,000 fewer cows than on January 1 of the preceding year and January 1, 1927, saw 324,000 fewer cows than January 1, 1926.

The total production of milk, however, has not decreased. The increased demand for fluid milk has been met partly by a slight increased production per cow and partly by converting less milk into manufactured products.

The average cow in this country is credited with producing 4,500 lbs. milk and 180 lbs. fat a year. The 360,000 cows now included in co-operative herd improvement work (cow testing associations) average 7,500 lbs. milk. This plan not only affords a means of meeting the demands of increased consumption of milk but also of doing it at less cost per unit of production. We are told by the Bureau of Dairy Industry that a cow producing 9,000 lbs. of milk requires only 40 per cent more feed than one producing 4,500 lbs. or half as much.

Dairy herd improvement work has been in operation in this country for 20 years but less than two per cent of our cows are in herds under its influence. We can produce more cows like the average cow to meet the increased demand for milk but this will not lower the cost of producing milk. We can keep up with the demand for dairy products with even less cows than we now have if we will only realize the sound economic principles of dairy herd improvement work. Let us meet the demand with better cows and less cost of production.

CAPITAL FOR DISTRIBUTION

It seems strange that farmers with an investment of twenty to thirty thousand dollars in their farms and equipment hesitate to invest a dollar in a plant for processing and marketing their products. Anyone who has given this matter attention can clearly see the weakness of such an attitude and why farmers, on the whole, are in such a disadvantageous position for marketing their products. No farm is organized upon a proper basis or is the farmer in position to take advantage of market conditions, unless he has the equivalent of 10 per cent of his investment in his production plant devoted to distributing and marketing his products.

This, in substance, is a statement made to us by W. S. Moscrip, a successful breeder and farmer in Minnesota. Mr. Moscrip has also had long experience in the development of co-operative enterprises and is a director of the Twin City Milk Producers' Association, one of the best operated co-operative organizations in the country. The problems of agriculture will never be solved so long as the farmer is contented to interest himself only in production. All branches of agriculture must arrange to market a considerable percentage of their products co-operatively; or, in other words, to place themselves in control of processing and marketing a sufficient percentage of their products so they will be a substantial force in helping to determine the market value of their products.

Farmers have the same rights to determine market prices of their products as the manufacturers have to determine the market value of their products. It is not so necessary for manufacturers to co-operate for the purpose of taking advantage of market conditions as it is for farmers to co-operate. No one farmer produces any product on a sufficiently large scale to make him a commanding agency in marketing his product.

In order to place agriculture upon a basis comparable to other industries it is essential that the farmer invest sufficient capital in plants for processing, holding, and distributing his products.

CO-OPERATIVES MEET

The National Co-operative Milk Producers' Federation held its annual meeting in Milwaukee, November 15 and 16. This organization is made up of 40 or more co-operative associations located in the various parts of the United States. The membership consists largely of co-operative milk marketing companies, but the Land O' Lakes Creameries, Inc., and the Wisconsin Cheese Producers' Association belong to it. Any co-operative institution engaged in marketing dairy products is eligible for membership.

The National Federation is rendering a splendid service to the co-operative movement. Fortunately the men in charge of its affairs are directing themselves to the problems of co-operation and matters directly or indirectly affecting the development of the dairy industry.

The resolutions passed by this organization epitomize the subjects discussed at the annual meeting. They were, in brief, as follows: That Congress enact a tariff law which would place adequate duties on farm products and all raw products imported into the United States which either directly or indirectly come into competition with the products of American farmers; that Congress levy an excise tax on all vegetable oils and raw materials from which such oils are produced that are imported from the Philippine Islands; that agricultural credit facilities be enlarged to include long time credits to co-operatives to be paid on the amortization plan. The resolutions also asked for an increased flexibility of crop production credit, and securing of loans by co-operatives on commodity security for as short a period as two months. This association also recommended that there be federal supervision of cheese grades; that a larger appropriation be made by Congress for more dairy research and the expansion of the Division of Co-operative Marketing in the Bureau of Agricultural Economics; and that Congress provide adequate funds to defray the cost of administering the Lenroot—Tabor bill.

The delegates to the convention discussed the activities of their own local organization. This gives the leaders in each institution a rather comprehensive understanding of what the other associations are doing, how they have met emergencies, and otherwise handled the affairs of their organization. It seems to us both fitting and wise that the National Co-operative Milk Producers' Federation devote itself to securing information of this character for it harmonizes and nationalizes and develops uniformity among the various co-operative institutions of this country. These contacts bring new viewpoints and an understanding essential to the progress of the co-operative movement.

The organization is a strong influence in dairy legislation and both its president, John D. Miller, and its secretary, Chas. W. Holman, have rendered important service to the dairy industry when bills affecting it were being considered in Congress.

The following officers were elected: John D. Miller, president; Harry Hartke, vice-president; Frank P. Willits, treasurer; and Chas. W. Holman, secretary.

UNRELIABLE LEADERSHIP

The National Farmers' Union at its recent annual convention held at Des Moines, Iowa, passed the following resolution: "We declare that the present methods of testing cattle for tuberculosis are unfair, unreliable, and illegal, and suggest that pasteurization of milk at low temperatures would prevent any possible injury to health from the use of milk from tubercular cows."

We wonder if this resolution expresses the opinion of the majority of members of this farm organization. We can't conceive that it does. In the several states where the membership in the Farmers' Union is the largest, there is a very small percentage of tuberculosis, and the expense of eradicating it now would be very small compared to what it will be if testing is deferred until the herds grow larger and dairying becomes a more intensified industry. We are shocked at such leadership in any organization that would pass a resolution of this character, and it leads us to wonder just how far it is safe to follow them in other matters directed to the proper development of agriculture.

The resolution declares that the tuberculin test is unfair, unreliable, and illegal.

In what respect is it unfair? The federal and state governments are making appropriations to pay the farmer a large percentage of the value for his reacting animals and are bearing all the expense of testing cattle. The total sum raised by the federal and state governments for the year 1927 amounts to about $18,000,000. We have been much in favor of paying the farmers liberal indemnities to get rid of tuberculosis.

In tabulating the results of a large number of animals tested for tuberculosis, it has been shown that the tuberculin test is accurate to the extent of 95 to 98 per cent. It is not infallible, but we have no diagnostic agent that is more accurate and through the use of this test tuberculosis is being eliminated from the herds. There is adequate evidence to prove this.

We can not understand how the test is illegal for whenever laws pertaining to tuberculin testing have come before a state supreme court, they have been declared constitutional.

It is true that pasteurization of milk protects the consumer, but does it protect the producer from sustaining heavy losses when tuberculosis is harbored on his farm? Does the producer protect his family by pasteurizing the milk from tubercular cows? Cows and hogs from such farms sell at lower prices. It can be shown that the farmer have lost millions of dollars because of the lower prices received from animals coming from areas with a considerable percentage of tuberculosis. Why continue to inflict this loss upon the producers when the state and federal governments are willing to help them eliminate this loss? Where is the understanding and vision that we have a right to expect in men who occupy positions of leadership?

We have been very staunch friends of all farm organizations working for the purpose of improving agricultural conditions, and we deeply regret when we find an organization so large and powerful misdirecting its energies and giving wrong advice to its membership. The losses from tuberculosis are borne by the producer. That this disease and the losses sustained by it be reduced to the minimum is only good business.

Should I Buy Alfalfa Hay?

I am writing for information relative to the feeding of my 18 grade and pure-bred Holstein cows. I face a shortage of feed as I have only one silo 14x28 and have about 10 tons of mixed hay, mostly timothy. I expect to feed a 16 per cent dairy feed at the rate of 1 lb. for each 4 lbs. of milk produced along with a full feed of silage once a day, followed by a feed of hay. Would it be better to buy a carload of good alfalfa hay or would you prefer buying shock corn and cutting this up for the cows? Last winter the same cows milked up to 60 lbs. daily. They are now in good condition and freshened in November.

Sun Prairie, Wis. E. S.

If these cows are capable of producing from 40 to 60 lbs. of milk a day, we doubt if the feeds mentioned, together with the quantity to be fed, will supply their needs. A roughage combination of silage and hay, which is mostly timothy, requires a concentrate mixture yielding from 18 to 20 per cent digestible protein to properly balance the ration, and we think the rate of feeding should be a little heavier than 1 lb. to 4 lbs. of milk.

This silo contains approximately 75 tons of silage, enough to feed 18 cows 30 lbs. per head daily for 180 days, or until pasture is available with enough left to feed 12 younger cattle 20 lbs. per head daily for a similar period. The 10 tons of hay is enough to feed 18 cows 12 lbs. per head daily for only 3 months. The need is for more hay.

It would be much better to buy a carload of alfalfa hay to be fed with the silage than to buy shock corn and cut it for feeding. A combination of silage and alfalfa hay requires a concentrates mixture yielding 10 to 11 per cent of digestible protein to properly balance the ration. Such a mixture could be made of 300 lbs. ground corn or barley, 300 lbs. ground oats, 100 lbs. bran, and 50 lbs. each of linseed and cottonseed meals.

A roughage combination of silage, timothy hay, and cut shock corn requires a concentrates mixture yielding from 18 to 20 per cent of digestible protein to properly balance the ration. Such a mixture could be made of 200 lbs. each of ground corn and ground oats, 100 lbs. bran, 250 lbs. each of linseed and cottonseed meals, and 200 lbs. gluten feed in which mixture it is observed that 800 lbs. or two-thirds is purchased concentrates, whereas in the mixture given for silage and alfalfa hay, three-fourths is from home-grown grains.

If the alfalfa hay is purchased and it is desired to feed with it and the silage some of the mixed hay, it will be necessary to increase the protein content of the concentrates mixture. In this case, a 16 per cent dairy feed yielding about 13 per cent of digestible protein would be about right. If the alfalfa hay is not purchased but other roughage, such as corn fodder, is bought and if one does not have corn, oats, or barley available one should purchase a standard 24 per cent protein mixed feed, which will yield about 20 per cent digestible protein.

A Question of Wages

We wish to know what salary two men should draw per month on a dairy farm of 55 head of pure-bred Guernseys, 26 cows that are now milking. We are to commence working Oct. 15th and work until March 1st. We have to furnish our own board and fuel. We are farmers and the family consists of man, wife, and grown son.

Wisconsin. L. M.

We find the usual difficulty in giving concrete reply to an inquiry as to wages. Wages are largely governed by local conditions, by the efficiency of the laborer, and the amount and kind of work that is required. Generally speaking, we believe that farm wages without board in Wisconsin will run on the average from $60 to $75. In some cases, wages will be less and in some higher, but this will doubtless cover the greater majority of cases. In some sections this will be rather high for winter labor, but where there is considerable demand for help, wages may be even higher than this.

If you are to take only the usual care of this herd and are not responsible for some special classes of work, it would scarcely require the full time of two men with a herd of fifty-five cows where approximately half this number are in milk at one time. Of course, much depends as to the kind of care given the cows and as to whether you are required to prepare and deliver the milk in a retail market. Generally speaking, however, two men should do the work in such a herd in not over six to eight hours a day. When just ordinary herd care is given, it would occur to us that possibly $100 a month for the two men would be an equitable and rather liberal wage. Of course, if local conditions are such that there is a heavy demand for labor, then you can doubtless secure more; while if the supply of labor is above the demand, then the wages may be higher than the owner of the farm would have to pay to secure the labor he desired. Of course, the owner must also look to the efficiency of his employees as being one of the primary factors in setting the wage he can afford to pay.

Are We Talking About You?

Remember that beautiful day last June when, after what seemed ages of dark days, the sun broke forth in all his glory and you found the alfalfa ready to cut and the corn crying for cultivation—both at one and the same time—and only you and the hired man to do ten men's work?

You were "tickled pink" over the prospect of good crops, and scared stiff for fear you couldn't take proper care of 'em.

Remember?

Well, sir, that is just about how we folks at the HOARD'S DAIRYMAN office are going to feel in a few short days—unless you'll help.

Several thousands of our subscriptions expire around the first of the year.

Most of those good folks, if they run true to form this year, will wait until the week between Christmas and New Year to renew.

Along about that same time several thousand more will decide they have been struggling along without the Dairy Gospel for a sufficient length of time—and will hustle their orders in with instructions to "begin my subscription with your Christmas issue."

And we? Well, we'll be as happy as you were last June—and just as "stumped." Some of you are bound to wonder why on earth it takes those HOARD folks so long to enter a subscription. Some of you are going to get mad because we are so "unbusinesslike" and "stupid." We do the best we can, but no one can do a year's work in a week or two. Delays and mistakes do happen, especially when we are snowed under and have to put on "green" help. But you can, if you will, make sure no mistakes or misunderstandings will occur on your renewal.

To be a "good fellow" do this: *Look at the label under which this copy of HOARD'S DAIRYMAN reaches you. If it reads "Dec. 27" or "Jan. 28" it means your subscription expires around the first of the year.*

Then, if you want to make our Christmas a wee bit merrier than usual; if you want to make sure of getting the Dairy Gospel without a break (and who, if he milks cows, would want to be without it at $1.00 for three years,) fill out the renewal blank that's enclosed with this paper—and mail it *today.*

By so doing you will earn our undying gratitude—and leave us with more "nervous temperament" to be of greater service to you in the future than we have been in the past.

One more thought:

If you have enjoyed HOARD'S DAIRYMAN, and profited from reading it—and if you believe in passing good things around, what better Christmas gift could you get a friend than a three-year subscription to the Dairy Gospel? How better could you wish him a prosperous New Year than to put him in touch with information that will help him make himself a better farmer and dairyman?

There's room on the blank for several other subscriptions—and if you make a (+) mark in front of the other names we will write each one a letter telling him of his good fortune and wishing him a Merry Christmas in your name.

HOARD'S DAIRYMAN

And Here's a Christmas Present For You

If you will send us three subscriptions (at $1.00 each for three years and your own may be among them) we will send you a copy of our book, "The Life of W. D. Hoard," by Geo. W. Rankin. This book is not only an interesting account of the life of the founder of Hoard's Dairyman, but is really a vivid history of the growth and development of the dairy farming business.

To Secure Thick Cream

In science, as in practical affairs, many discoveries are the result of what appears to be chance. It is not all chance, however, because it requires a close and trained observer to recognize and make use of what chance has disclosed. This is well illustrated in the discovery, made at the New York Agricultural Experiment Station at Geneva, of one of the principal causes of high viscosity in cream, or thick, heavy cream as it is more commonly expressed.

The investigators noted that milk from the station herd seemed to produce a thicker, heavier cream than that from the herds of neighboring farms. It was the custom to cool the milk from the station herd and hold it in the refrigerator until needed for separation, while the neighboring farmers separated immediately after milking. In looking for reasons for the difference in the cream, this chance condition was observed and trials based on this were made.

One portion of the same milk was separated immediately after milking and the cream promptly cooled and held at 37 degrees Fahrenheit over night. The other portion of milk was cooled immediately after milking and held over night at 37 degrees Fahrenheit. It was then warmed to 90 degrees Fahrenheit, separated, and the cream cooled.

Both lots of cream were then held for varying periods of time, the viscosity increasing in each case with the time of holding. The striking result noted, however, was the fact that the second lot of cream was much thicker and measurement showed its viscosity was ten times greater than the cream which had been skimmed immediately after milking.

While the thicker cream secured by cooling and reheating milk is the practical result, it is interesting to note that microscopic examination showed that the fat was finely dispersed throughout the cream of the first lot, while in the second lot the fat globules tended to cluster together and be distorted in shape.

"The viscosity or thickness of cream," writes Professor Dahlberg, one of the investigators, "is dependent primarily upon two factors. One is the percentage of fat and the other the extent to which the fat is clumped in the cream. The investigation at this institution has clearly shown that almost any degree of viscosity can be secured on a cream testing in excess of 25 per cent fat by controlling the fat clumping. Briefly stated, the fat clumping can be controlled by the condition of the fat at the time of separating. Neither liquid nor hard fat clumps during separation, but fat in a semi-solid condition does clump. The fat clumping can be brought into proper condition by first cooling the milk to 40 or 50 degrees and holding at this temperature long enough (3 to 10 hours) for the fat to harden. The milk should then be warmed to 85 or 90 degrees and then separated. After a few hours aging at 50 degrees or below, cream produced in this way will have an abnormal high viscosity."

The first conclusion the reader would draw is the desirability of this method when cream is sold for consumption and that the process will produce a cream better fitted for whipping and for ice cream manufacture. The investigators, however, state that this process is of doubtful practical value because it is somewhat expensive and does not lend itself readily to routine milk plant operation. Further, they did not find this high viscosity cream was much improved in whipping properties.

For those interested in technical details of the investigation, we suggest writing the Agricultural Experiment Station, Geneva, N. Y., for a copy of Technical Bulletin 113, "Viscosity, Surface Tension, and Whipping Properties of Milk and Cream."

There is something about a windshield glass that magnifies a tack and makes a pedestrian seem a small matter.—Ex.

Now is the Time

to take stock of the year's dairying

Have you made any mistakes which have lessened your profits, such as:

1. Turning your cows on pasture too early.

2. Leaving them on pasture too long.

3. Getting your hay in too late.

4. Neglecting to weigh the feed consumed and milk produced by each cow.

5. Failing to feed enough grain through the Summer.

6. Not properly utilizing your home-grown grains.

7. Spending too much money for unproductive feeds.

If you've made any of these mistakes this year don't make them again in 1928. Nos. 1 to 6 are entirely up to you. But we can help you in regard to No. 7.

Diamond Corn Gluten Meal

is one of the most productive of all feeds. Why? Because it is so high in protein of good quality, and so high in total digestible nutrients that a small or moderate amount of DIAMOND in the ration permits the inclusion of large amounts of homegrown grains and other low-priced carbohydrate feeds such as bran, middlings, hominy, etc.

Write us for circular showing how to feed DIAMOND with your homegrown grains for bigger production at smaller cost.

FARMERS, ATTENTION!

An opportunity to secure a 40 Acre Tract in the Lower Fraser Valley—one of the most famous Dairying Districts of Canada—only 60 miles from Vancouver, Canada's Fourth largest city.

This land is part of the lands reclaimed by the Sumas Dyking Commission through the draining of shallow Sumas Lake. It is virgin soil which has been given preliminary cultivation by the Commission. It is surrounded by well settled and highly improved land on which Dairy Farming is carried out with wonderful results as well as the raising of market produce, small fruits and mixed farming. Exceptionally favorable climate and living conditions. Good transportation by highway, railways, electric tram to ready markets.

Offered at Inviting Prices and Favorable Terms

Write for Folder and get full information. Address

SUMAS DYKING COMMISSION, Court House, NEW WESTMINSTER, B. C.

NOTE—Immediate inquiry is desirable as the area of Sumas Reclaimed Lands placed on the market this year is limited.

Royal Winter Fair At Toront

F. E. ELLIS, ONTARIO

THE Royal Winter Fair of Canada, held in Toronto, November 16 to 24, was all that its founders intended that it should be, and more. The Royal, brought into being in 1922, was designed to be a national live stock event. It was intended to be the one fair at which every part of Canada would be represented. This ambition has been fully realized. At the recent show breeders were on hand from every province with the animals that had won on provincial circuits. But the Royal has become an international event. The entries from the United States, in cattle and horses, totalled several hundred head. This added spice and interest to the competition and the prize money was distributed over the entire continent.

This year's Royal surpassed all its predecessors in magnitude. With more stock gathered together than was ever entered at any one fair on this continent, there was room for all under the one roof in the new quarters provided. This made it very convenient for both visitors and exhibitors. An idea of the extent of the exhibits may be gathered from the entries in the dairy classes. There were well over 400 Ayrshires, 321 Holsteins, 186 Jerseys, 147 Guernseys, and 46 French Canadians. The beef classes were almost equally numerous. Add to this a great horse show, a big display of sheep and swine, a national seed show, a national apple show, and a flower show that made the western annex of the Coliseum a bower of beauty and one has an idea of what the Royal now presents to the fair goer.

Ayrshires Again Predominate

At the first Royal the Ayrshire breeders staged the largest exhibition of the breed ever seen in the world—423 head. At that time something was sacrificed in quality to get size. This year the 1922 record was almost equalled and from first to last it was a quality exhibition. Quebec and Ontario had the largest representations but Nova Scotia, Prince Edward Island, Saskatchewan, and Alberta also shared in the awards. From the United States came herds from Strathglass Farm, New York; J. E. Davidson, Michigan; Estate of L. S. Clough, Pennsylvania; and an entry or two from Wendover Farm, New Jersey. Awards were placed by John Young, Scotland.

The mature bull class, with 20 entries and 17 drawn out in the ring, was an index of the character of the competition. There were bulls there that had been recent champions at the Scotch shows, champions at state fairs, and the leaders of the Canadian circuit. Mr. Young expressed the opinion that such an aggregation of Ayrshire bulls had never before been drawn out in one class. This class demonstrated the dependence of breeders on this side of the water on the breeders in the home of the breed. Five of the first six bulls placed were bred in Scotland. Hobsland White King, Strathglass Farm, the champion of the recent National Dairy Show, was placed first. When it came to championship honors, however, he had to give place to the two-year-old Edgertowne's Sir Oliver exhibited by Cumming Bros., Ontario. This bull has had an unbroken record of success at Canadian shows. R. R. Ness & Sons, Quebec, had the junior champion in Howie's Top Grade, the grand champion of the last Canadian national exhibition. Strathglass Farm had reserve junior on Strathglass Royal Charmer. Their senior yearling, Strathglass Kirte, junior champion of many United States shows was fifth in his class, having been in condition for several days.

Mature cows in milk brought out 26 shapely matrons and here the great Ness cow, Burnside Blossom Andrietta, one of the greatest show cows the breed has ever produced met her first defeat. This seven-year-old cow has 31 grand championships to her credit and has six living beef calves, several of them with notable ring records. She is also a producer having a total official production in four years of 45,581 pounds milk and 2,088 lbs. fat. She had freshened with twin calves shortly before and was not showing to best advantage. Even at that, however, she was quite evidently the greatest cow in the ring and placing her into second place because of a temporary lack of condition seemed to be a case of overlooking the essentials and placing the premium too strongly on bloom. The cow that got the preference was Ba Flame, shown by Glen Campbell Farms, Ontario, a cow of beautiful type and in finest fit but too small to be considered a really great cow. The class for dry cows brought out 23 entries and Glen Campbell Farms again won. The champion was found in the four-year-old milk class—Springbu Lady Beauty II, exhibited by H. Swart, Ontario. This young cow showed pleasing type, a great middle and a practically ideal udder. A senior calf was junior champion, Bois la Roche Sprightly, shown by W. Skinner, Quebec. There were from 25 to 30 entries in all the younger classes of this breed.

A National Holstein Show

The Holstein classes brought out contenders from all provinces but one. Axel Hansen, Minnesota, placed the awards with general satisfaction. The fit, type, and uniformity of the black and white classes were in such strong contrast to what this breed brought out a few years ago that the claim to standardized type for the breed seemed to be justified. J. Innis & Sons, Ontario, who have been the Holstein leaders all over the Canadian circuit this year, were the heaviest winners. Their senior herd bull, Abbekerk Sylvius Lad, was grand champion. This bull is a son of Aaggie Sylvia, the only Canadian Holstein cow that has yet won grand championship honors at a National Dairy Show. Geo. M. Wood, Ontario, had the reserve senior champion in Sir Alcartra Inka. Howard Graham, Quebec, had the junior champion in yearling, Mantel Count of Hudson.

The milk cow class brought out a score of splendid animals, including the new four-year champion butter producer over all breeds, Springbank Snow Countess, bred by T. H. Dei, Ontario. Haley & Lee, Ontario, had the leader in Gypsie Posch Ruby. The dry class had the champion in Oakhurst Colantha Abbekerk, for M. Victoria Farms, Quebec, a cow that carries almost faultless type with massive size. The reserve went to C. Hardy on May Walker Inka Segis, the two-year-old heifer for which was paid $7,000 at the recent Minnesota sale. This was a doubtful win over an Innis heifer that showed greater depth of body and more desirable udder formation. Innis had the junior champion on Winona Lennox De K, a consistent winner this season. Space forbids mention of other awards but cattle from as far west as British C-

nbia and as far east as Prince Edrd Island were prominent in the nnings.

U. S. Jerseys the Champions

The Jersey classes were strengthed by two herds from across the e—Elm Hill Farm, Massachusetts, d The Oaklands, Michigan. Prosor J. C. McNutt, New Hampshire, ced the ribbons. To the American itors went all four championships. m Hill Farm had the senior champn bull with Cedarine Golden Sul- and junior with Volunteer's April ltan. Both female championships nt the same way, with Imp. Yolan- and Rosebay's Golden Xenia. Canan exhibitors, however, won heavin many classes including six firsts senior female classes and a couple firsts in bull classes. The most minent winners were John Pringle d A. T. Little, London; Jas. Bagg & ns, Edgeley; Queen Alexandra nitarium, London; and F. J. Bagg.

Guernseys are Advancing

The Guernsey breed has made phemenal progress in the showing ade at Canadian fairs in the past lf dozen years. There are more ernseys shown but it is the type provement that is really noterthy. Even at the first Royal this eed made a rather sorry showing at e tail end of all classes. This year e classes were fairly uniform alough the claim could hardly be ade that type has been as well stanrdized as in any of the other dairy eeds. Geo. M. White, New York, ade a satisfactory judge.

Men of wealth are playing a large rt in the development of the Guernv breed in Canada. Competition was enest between the herds of F. W. indells, Nova Scotia, and Don Alda rms and Martindale Farms, Onrio. Some of the smaller breeders ade an excellent showing, however, tably Jas. A. Telfer, Ontario, and . G. Darke and L. W. Roper, Prince lward Island. Swindells had the and champion bull in Langwater armion's Prince Edward, this being e third time that this bull has headthe Guernseys at the Royal. Don da Farms had reserve senior on remost Lad. Martindale Jeweller is junior champion.

The females, on the whole, were a ronger lot than the bulls. Aged ws, yearling heifers, and senior ifer calves were the strongest sses. The mature milk class, with entries, was a really fine class aded by La Fleur du Jardin of artindale, the grand champion. Don da won the dry class of 13 with ugerties Ultra Anna. Reserve sen- and grand was Martindale Faith, dry two-year-old. L. W. Roper had e junior champion with Appletree oint Amelia, a junior yearling, and vindells the reserve on a senior calf. was rather notable in the Record Performance classes that the recds were evident in the cows themlves, there being no changes made hen the points for production were lded.

French Canadian Cattle

The French Canadian breed is the ly dairy breed that has been develed on this continent. The cows are milar to the Jersey in appearance, e extremely hardy, and have been nsiderably improved in the past cade both in conformation and procing ability. The breed is enjoying ite a boom in its native province of uebec and at the Provincial Exhition at Quebec last fall there were 0 head entered. There was only a nall showing at this year's Royal.

Cream Paid for on Grade

In dairy products, Ontario creamy men managed to hold their own with the makers from Western Canada for the first time in many years. The prairie makers have been getting all the firsts and most of the other awards at eastern fairs with their butter manufactured for the British trade. This year Ontario men divided the high awards and the sweepstakes butter was made by Goode Bros., Ontario. All the winning cheese was from Ontario. It may be of interest to add that practically all the cream now delivered to creameries in Canada is paid for on grade. In Ontario, one of the last provinces to adopt cream grading, this reform has accomplished more for the improvement of cream and butter than was accomplished in a lifetime of educational effort without the stimulus of financial reward.

Montana Dairy Manufacturing Short Course

The twelve weeks' dairy manufacturing short course at Montana State College will begin January 2nd and continue until March 23rd, 1928. This course is designed to meet the needs of men who have a sincere desire to pursue creamery work. The course is arranged to give students practical training in the manufacture of cheese, butter, and ice cream; the testing of milk and cream, the judging of dairy products, and feeding of dairy cattle.

For the further information write Professor J. A. Nelson, Dairy Department, Montana State College, Bozeman, Montana.

Aunt Ada's axiom: Real love always serves.

Pressure-toughened Rubber

lets you enjoy their warmth, comfort and protection for extra months

For work or riding in the car, thousands of women choose these 4-buckle Hi-Press gaiters because of their warmth and long life.

On every farm, men need husky work rubbers, and Goodrich heavy dull Norkas of pressure-toughened rubber certainly fill the bill.

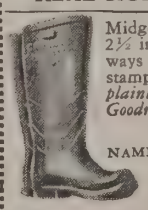
In city or country, women wear the new ZIPPERS, *made in many styles and colors, with the genuine* HOOKLESS FASTENER *which glides so easily open or closed. Be sure the name* ZIPPER *is on the pair you buy.*

YOU know how it is with cloth-topped arctics and gaiters—you can wear them just as long as their rubber soles stay good.

So Goodrich starts from the ground up. All the rubber in Hi-Press footwear is *toughened by pressure*—strength and long life are literally *pressed* into the soles.

Then the uppers are built and reinforced to match the extra strength of these remarkable soles.

Or take the Heavy Dull Norkas, worn by the man above. The pressure-toughened rubber comes all the way to the top—keeping out mud and moisture—protecting the shoes.



For work or "dress-up"—for walking, wading, and all outdoor activities—there is a special type of Goodrich Hi-Press Rubber Footwear which gives longer protection and "long run" savings.

TOP NOTCH

Down at the heel? *Never!*

WHERE do your arctics usually break through first? At the heel, don't they? Then, even though the sole and uppers are still good, you have to throw them away.

But you won't have that trouble with Top Notch Redfore cloth-top arctics. The "Clincher Cushion" heel construction makes the heels last as long as the tough, red soles. This is a patented feature exclusive with Top Notch arctics. So you'll find it a real economy to buy your arctics at the Top Notch store.

The Top Notch line includes cloth-top arctics in 4-buckle and 5-buckle styles—arctics of *all-rubber* from top to toe—heavy and light rubbers. Good-looking and good-fitting as well as long-lasting. Ask for Top Notch by name, and look for the Top Notch Cross.

TOP NOTCH CORN BELT ALL-RUBBER ARCTIC

Waterproof from top to toe. Strong and rugged to stand hard punishment.

COW BOY SURE HEATER for STOCK TANKS

KEEP COWS HEALTHY

Illinois State Experiments show that 85% of Cows kept in Close Warm Barns tested Tubercular. Prevent this by keeping water tank in open barnyard equipped with a Self-Sinking

COW BOY TANK HEATER Saves Money Every Week

Turn cows out of barn to drink in Fresh Air and Warm Water. "Better drink from a Large Tank than from a Small Bowl." Burns coal, cobs or wood. Outlasts all others. Durable, practical, reliable. Quickest to heat; strongest draft; ashes removed with no check to fire; adjustable grates; keeps fire 24 hours. ABSOLUTELY SAFE. Warm water helps digestion; saves grain.

"Purchased 3 of your Tank Heaters last winter, worked very satisfactorily and are well worth their cost. Every stockman should use one." W. H. PEW, Prof. of Animal Husbandry, Iowa State College, Ames, Ia.

The C. T. A. Did It

THE "RUNT" BULL AND HIS DAUGHTERS

Margaret's Eminent of Gussana Farm and four of his daughters were loaned to the Wisconsin Dairymen's Association by Fred Burhop as a part of its cow testing exhibit at the recent state fair. These daughters averaged 458 pounds fat, an increase of 75 pounds over what their dams were able to do. Good bulls and good cows made known and made possible by testing, is Mr. Burhop's formula for success in dairying.

KNOW your bull by his daughters" and "Build your herd from a good cow" were the two slogans illustrated in the cow testing association exhibit at the 1927 Wisconsin State Fair, an annual affair put on by the Wisconsin Dairymen's Association.

A pure-bred Guernsey bull and four of his daughters and a grade Guernsey cow, "Sunbeam," with four of her daughters, all from the herd of Fred Burhop, a member of the Thiensville—Lakefield Cow Testing Association, told a significant story of the value of a cow testing association membership.

"My first owner, Fred Burhop, sold me cheap when two years old because I was a *runt*. See my daughters. The butchers can't get me now since my first four daughters average 1,138 lbs. more milk and 75 lbs. more fat," read the sign over the bull pen.

Fred Burhop has been a member of the cow testing association for five and a half years. As soon as he tested the daughters of the "runt" bull and discovered their production, he bought the bull back selling him this last spring to Charles Garbisch because most of the herd of 23 or 24 head of grade Guernseys on the Burhop farm were bred by the bull.

The four daughters of the bull, Margaret's Eminent of Gussana Farm, averaged 8,929 lbs. milk and 458 lbs. of butterfat. No wonder Fred bought back this bull. The cow testing association did it.

"Build your herd from a good cow." Sunbeam, the foundation cow in Fred Burhop's herd, has an association average record for five years of 8,374 lbs. milk and 447 lbs. butterfat. Four of her daughters averaged 475 lbs. of fat each.

SUNBEAM AND HER DAUGHTERS

Sunbeam has five C. T. A. records averaging 447 pounds fat. Her four daughters, all by the same sire, have an average of 475 pounds fat. Sunbeam and her daughters are owned by Fred Burhop of the Thiensville—Lakefield C. T. A. of Wisconsin. The Burhop herd of 13 cows averaged 414 pounds fat last year. The average five years previous for the same number, but not the same cows, was 277 pounds. In five years he doubled his profit over cost of feed, and he is generous enough to say "it has all come from testing and knowing."

Four Out of Seven Take Milk Drinks

Four out of every seven people who order food or drink over the soda fountain counter at a State and Randolph drug store in Chicago have a milk drink, according to a recent survey by the National Dairy Council. In this one store they sell 125 gallons of pasteurized milk each day, equal to 2,000 glasses. The average number of people served each day is 3,500, which indicates that 2,000 out of every 3,500 people ordering lunch or light afternoon refreshments are milk drinkers.

Although malted milk sells for twenty cents and milk shakes for fifteen cents, the first is ordered almost twice as much as milk shakes. The favorite flavors of both are chocolate, strawberry in season, and pineapple. Strawberries are the only fresh fruit lending themselves to use in milk drinks.

Acidophilus milk is becoming increasingly popular in drug stores. Five hundred bottles a month are sold at a single Chicago store, usually steady customers who are drinking for their health.

That the trend of milk-drinking soda fountains has affected the soda drink business is evident on checking over any orders placed by managers in soda fountains in various parts of Chicago. It is usually found, according to the Dairy Council survey, that the proportion of milk drinks over soft drinks increases in the stores located in sections of the city where standards of living and general welfare are higher.

New Zealand Control Board

The New Zealand Dairy Produce Control Board has issued regulations governing the export of dairy products from New Zealand. A report embodying these regulations may be had upon request from the Foodstuffs Division, Bureau of Foreign and Domestic Commerce, Washington, D. C.

Uncle Ab says sowing and reaping are only a part; it's what you do between that counts.

"You're there with a Crosley"

A Wonderful Christmas day!

Made perfect by the pleasure and ›y the Crosley Bandbox brings for very day thereafter!

With it the activities of the world are mir-›red in your home. Your house is on the ›ain street of the nation. National events re held next door—the market changes in our own living room—famous preachers de-ver their sermons in your home—You listen in ·n every activity—You hear everybody's point f view from radical to fundamentalist—You njoy the world's funniest clowns and its weetest singers. Cheer, laugh, exhult, ap-›laud, delight at the world's sport, fun and en-ertainment brought to your threshold! Whatever happens—"You're *there* with a Crosley."

Its simple operation is easily understood and ts wonderful performance is at the command f any hand that can turn a dial.

Experienced radio owners will look first for fundamental points and to every set they onsider will address these questions:

1. Is it selective?
2. Is it sensitive?
3. Is it easy to operate?

atisfied on these points they will look for:

1. Single dial control
2. Illuminated dial
3. Volume control
4. Single cable leads
5. Console installation adaptability
6. Reasonable price.

Millions will buy the Crosley Bandbox. his amazing little set is now displayed by ore than 16,000 dealers.

The Crosley Bandbox is a 6-tube receiver.

The circuit of this set is of the excellence ou would expect from a group of skilled en-ineers suddenly given the pick of the world's adio patents to work with.

Crosley has always given the radio world its iggest value for its dollar. Contemplate the erfection possible when the doors of the research and development laboratories of The Radio Corporation of America, The General Electric Co., The Westinghouse Electric and Manufacturing Co., The American Telephone & Telegraph Co., and the Hazeltine and Latour Corporations were thrown open.

Licensed under their patents!

The Crosley Bandbox is totally and completely shielded. Every element is absolutely separated from every other element by solid shielding. Coils are covered with copper. This could have been done cheaper but efficiency would have been sacrificed. Condensers are housed in cadmium-plated steel. All wiring is separated and shielded from all other parts of the receiver. Solid, sturdy, substantial, the entire set is assembled on a heavy metal chassis.

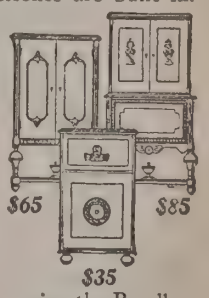
The tuned radio frequency amplification stages have been absolutely balanced through use of the Neutrodyne principal. The set is a genuine Neutrodyne.

To the initiated this means much. To the layman it manifests itself only as a radio receiver that does not squeal or howl when you are trying to get a station.

The shielding makes the Bandbox highly selective—the circuit makes it acutely sensitive and the design makes it extremely easy to operate.

The Bandbox is operated with a single station selector (one dial).

In most localities and in most owners' hands the single station selector will find all the programs anyone could possibly wish. It is the far away stations of weak power but perhaps good music that are captured by the use of the little auxiliary tuners called "Acuminators." Their function is best likened to a pair of field glasses. As the lens bring the distant scene to nearby aspect, so do the Acuminators bring the remote station signals up to room filling volume. Ordinary one dial radios can never perform like this. The Acuminators, little secondary adjustments *exclusive* to Crosley give the Bandbox a substantial command of the air and *all* that is in it.



The dial of the Bandbox is illuminated. For shadowy corners and dim eyesight it recommends itself.

Volume Control is necessary on good radio today. Nearby and high powered stations send terrific impulses into the receiver. Detuning has been a favorite method of softening this loud reception but with stations closer and closer together on the dial detuning creates an overlapping of programs. The volume control of the Bandbox cuts the loudest blast down to a veritable whisper.

A single cable leads all outside and power connections from the Bandbox. In this brown fabric covered cable lies each lead covered with colored rubber for protection, accuracy and easy assembly. Tidy housewives appreciate it.

The adaptability of the Bandbox to installation in all types of cabinets is a feature. The metal case of the Bandbox lifts off the chassis. This leaves the closely grouped dial, switch and volume control shafts to be stuck through holes in the panel of any sort of cabinet. The escutcheon is quickly screwed over them and the console installation is not only complete but has no earmarks of a makeshift.

Prominent furniture manufacturers thru their long experience have produced beautiful cabinets at moderate prices. The celebrated Crosley Musicones are built in. Crosley dealers sell them. Purchasers may know they are best suited for Crosley radio by looking for the "approved label" in each one. Crosley dealers get these cabinets only from The H. T. Roberts Co., located at 1340 S. Michigan Ave., Chicago, Sales representative for The Showers Brothers Co., Bloomington, Ind., and The Wolf Manufacturing Industries, Kokomo, Ind.

Much has influenced the $55 price of the Bandbox.

Throughout the country millions examine the Bandbox today. They see it the achievement of an organization who began its development when radio as we know it today began. Its success has been tremendous if clamorous demands from dealers are any indication. Even at any price it would be a sensation, for its performance ranks with the most expensive radio receivers on the market.

An AC Bandbox using ordinary house current electricity for power, sells for $110.

Coming Events

Jan. 17, 1928—Annual convention of The Milk Council, Inc., 228 No. La Salle St., Chicago, Ill. Secretary M. O. Maughan.

"Hello, is this you, Abe?"

"Sure it's me."

"This is Abe Potash I'm talking to?"

"Yes, yes, what do you want?"

"Well, Abe, I want to borrow fifty dollars for—"

"All right. I'll tell him as soon as he comes in."

News From Washington, D. C.

[Special to Hoard's Dairyman.]

Washington, D. C., Nov. 25—The Seventieth Congress will convene December 5, and after the routine of organization will proceed to tackle about the biggest grist of national legislative business which was ever accumulated for a peace time session. Even the organization will not be entirely routine either, for in the Senate there is first the matter of seating two members, Vare and Smith, whose election is under contest, and on this issue there is likely to arise a line-up in which certain progressive Republican senators unite with the Democrats, making up a majority group which under certain circumstances might overturn the normal Republican majority and elect a Democratic or nondescript set of Senate officers.

After organization nothing is to be routine, according to present indications, from the drop of the first gavel until the last half minute before the session adjourns to go to the national conventions next June. The tax bill is being written at this time by a narrow majority in the House Ways and Means Committee but with so many contested points that there is little likelihood of the majority decision of the committee standing up before either a House or a Senate majority, and even this majority committee decision at odds with the requests of the president and the secretary of the treasury, as to two major items, the automobile tax and the inheritance tax. In both of these cases the president and secretary of the treasury advise one way and the committee majority has voted another way.

The major interests of the dairy industry in legislation this year, with one exception, come under the head of special legislation and therefore falls inside of the category of facing much difficulty. Just what the industry's legislative program is to be depends on the action which may be taken at the December meetings of the various dairy organizations in Chicago. The one project already agreed upon is for a generous appropriation to permit the Bureau of Dairy Industry to expand some of its work to take up needed new research or greatly enlarged research work already outlined and started.

Other legislative matters under consideration include further effort to probe into the cause of contagious abortion through a research investigation under the direction of the secretary of agriculture, increased support for the work of tuberculosis eradication, and sending a national delegation to the World's Dairy Congress next June. These three matters have general support and are likely to be approved generally. There is considerable general discussion of the matter of legal standard for cheese and processed cheese, and some further changes in the butter standards law. There has been some discussion of complete separation of the dairy and poultry work in the Bureau of Agricultural Economics, just as they are completely separated in the animal industry bureaus.

No consideration of congressional work is complete without mentioning farm relief. It is apparent that there is no nearer an agreement by major interests than when Congress ended in the spring after the President vetoed the McNary—Haugen bill. Several different plans are being considered, a number of bills will be introduced, and the effort to enact legislation for the benefit of farmers will be just as forceful and just as noisy in this Congress as in the last—possibly more so.

Interest in the World's Dairy Congress has been aroused here by two recent events. One is the visit to Washington of A. D. Allen of London, Eng., organizing secretary of the Congress, who is paying a two-day visit here as this is written. He met a good sized group of dairy workers here at a special luncheon in his honor given by the American Dairy Federation, and then visited at the Dairy Laboratories of the Department of Agriculture, in various dairy plants, and paid special visits to the Canadian and British Embassies. He told, in a brief address at the luncheon, of the great interest he has found in all parts of the country in the meetings to be held next year in England. The other event was the proposal made by the secretary of agriculture and approved by the state department looking to naming an official delegation to attend the Congress.

New York Milk News

HOARD'S DAIRYMAN:—Utica, N. Y., used to be quite a center of interest in milk marketing. All of that has not yet disappeared. The Dairymen's League headquarters have long since been moved to New York City but they continue their ice cream plant and maintain one of their division offices here still. It is the city where most of the organization meetings for improved co-operation are held. While there lately I called around at some of the still remaining centers of activity. Mr. Garlock, who was the president of the Eastern States Association, still has his office at the old stand. The organization ceased to function some time ago but he still sells milk for a number of co-operative milk plants.

Down a little further is the office of Mr. Hovey who at one time was the general manager of the League. He now has a milk business of his own and that business is somewhat on the gain. In part it is a brokerage business, but he has some milk plants of his own and he handles a lot of milk every day. He has been able to return to the farmers quite good dividends for their milk. In the same building is the office of Mr. Pratt, the lawyer who has been named by our dairy farmers in the last few years oftener than any attorney that I can think of. Some have spoken highly of him and others said something different. His first statement to me was that he is no longer fighting the League. He formerly defended those who violated League contracts. He is attorney for those who do not want the tuberculin test made obligatory.

Down a few flights and I called at the stand of the Non-Pooling Dairymen's Association, expecting to find some of the former leaders of that organization. There has been a change. The editor of the "Non-Pooler" has gone elsewhere and that publication no longer functions. Instead of the faces one formerly found, there is simply one office manager for the greater portion of the time and that not of the Non-Pool Association but of the Unity Dairymen's organization. The office is run at small expense. The association has some membership but I do not think that the number is given out. Members sign an order authorizing the buyer of the milk to deduct one cent a hundred and pay the same to the association. This money enables them to keep the office and pay certain expenses for work to increase membership, ar presumably expenses of committe that meet to discuss prices, et These meetings I believe are held the Utica office. After a price recommended the local does its ow selling but is told not to sell for le than the price named.

The League price for October $2.88 for 3.5 per cent milk at 201-210 miles from the city. It is 30 cen above the price a year ago. It within 13 cents of the Sheffield pri and that is the nearest that I remer ber their coming to the Sheffields a though that is on memory alon With the League getting its highe price, gaining in membership, ar handling more milk for some tim the officers and members are feelin much more encouraged than at ar time in its history.

New York. H. H. LYON.

New England Co-operative Leader Dies

Richard Pattee, managing directo of the New England Milk Producer Association, Boston, Massachusett died at his home in Laconia, N. H November 6, following an illness o more than a year.

Besides being active in the organ ization and development of the asso ciation of which he was managin director, Mr. Pattee was also active i promoting the National Co-operativ Milk Producers' Federation and wa its vice-president at the time of h death. He also served as chairman o the Board of Trustees of the Amer can Institute of Co-operation.

He is survived by Mrs. Pattee, a son Samuel, who is a student at Dar mouth, and one daughter, Mary. H loss to the co-operative movement i the New England States will b mourned by many.

J. C. McDowell

HOARD'S DAIRYMAN:—This introces Dr. J. C. McDowell, dairy husndryman, author, lecturer, and ince of fellows!

Occupying the unusual but pleasg filial distinction of graduating om the same institution and on the me day as that of his son, J. C. cDowell of the Bureau of Dairy Instry, United States Department of griculture, received the degree of ctor of philosophy from the Ameri-n University, Washington, D. C., at recent commencement exercises. s son, Charles J., was awarded the gree of bachelor of arts, specializg in economics. At the preceding mmencement, Miss Dorothy Mcowell, a daughter of the elder Mr.

J. C. McDOWELL AND HIS SON, CHARLES, AS THEY APPEARED UPON GRADUATION FROM AMERICAN UNIVERSITY

cDowell, was graduated with the gree of bachelor of arts, specializg in social service work.

J. C. McDowell, known far and ide among dairy farmers because of s ceaseless activities in the promoon of cow testing associations, has een "going to school" for three ears, pursuing academic studies hen off duty in the Bureau of Dairy ndustry. Going to and from work, n the Washington street cars, this riter perchanced to see him assidusly digesting the contents of a textook—probably a book on economs, the subject in which he specialed in obtaining his Ph. D. degree. lassroom exercises at night furnered his ambition, and two years go he received the degree of master f arts from the American Univerty.

Dr. McDowell is a native of Marquette County, Wisconsin, and was orn in a log cabin. He is self-made -master mechanic that he is! After ttending the rural schools of Marquette County and the normal school f Milwaukee, he matriculated in the niversity of Wisconsin, from which e received the degree of bachelor of cience in agriculture.

Dr. McDowell has been associated ith the United States Department of griculture for 19 years, eight of hich he served as economist in farm anagement and eleven as dairy husandman in the Bureau of Dairy Industry. He is the author of many arcles and bulletins on farm economs and dairying, one of his publicaons on milk being perhaps the most opular literary production of the epartment of Agriculture. He is a rolific writer, contributing to outde journals as well as author of deartmental bulletins. The 1926 earbook of Agriculture, just from he press, contains two contributions rom his pen: "Cow Testing Tales rove Breeding and Feeding Pay," and "Proving Dairy Sires Through Daughters' Records Worth While."

The academic cap and gown, which may for the moment seem forbidding to dairymen and farmers who have seen Mr. McDowell in the motion picture role of a real "dirt farmer," have not deprived him of his cast as acting the part of an honest-to-goodness tiller of the soil. Invariably when the Department of Agriculture needs to portray the character of the true farmer, Mr. McDowell is selected to play the leading role. Consequently he figures in many of the educational films screened by the Motion Picture Division of the Department of Agriculture.

Washington, D. C. S. R. WINTERS.

ATWATER KENT RADIO

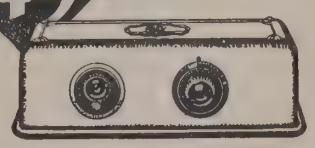
Tremendous saving in the world's finest radio

EVEN before these new 1928 low prices were announced, Atwater Kent Radio was overwhelmingly preferred in rural homes.

NOW the always moderate prices of Atwater Kent ONE Dial Receivers and Radio Speakers are still lower. NOW the radio that most farm families prefer, as proved over and over again by their words, is within the reach of thousands and thousands of families who still thought the prices of really good radio were a little high.

Universal demand has enabled the largest radio factory to put the economies of big production into effect. At the same time our radio has been greatly improved in performance.

Much better radio—at much lower prices—with Christmas just ahead! Let the nearest Atwater Kent dealer show you.



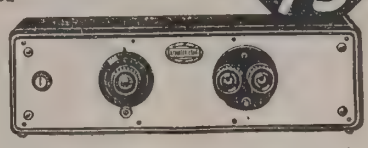
Write for illustrated booklet telling the complete story of Atwater Kent Radio

ATWATER KENT MANUFACTURING COMPANY

4769 Wissahickon Avenue *A. Atwater Kent, President* Philadelphia, Pa.

ONE Dial Receivers licensed under U.S. Patent 1,014,002

$49



Model 35, a powerful ONE Dial, six-tube Receiver with shielded cabinet, finished in two tones of brown crystalline. Ideal for a small table, window sill or bookshelf. Without accessories. $49

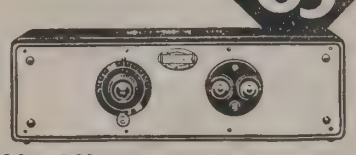
Electrified, if you like

Any Atwater Kent Receiver can be operated from your electric light circuit as a source of current supply. It's merely a matter of equipment. Just tell the dealer which you wish—battery power or socket power.

Atwater Kent Radio Hour every Sunday night on 23 associated stations

$75

Model 33, a very powerful ONE Dial, six-tube Receiver with solid mahogany cabinet and gold-plated trimmings. Unusually effective where distance-getting is essential or inside antenna is necessary. Simple antenna adjustment device assures remarkable selectivity. Without accessories. $75



$24

Model E Radio Speaker. New method of cone suspension, found in no other speaker, makes certain the faithful reproduction of the entire range of musical tones. An extraordinary speaker—hear it! $24

Prices slightly higher from the Rockies West

$65

Model 30, a powerful ONE Dial, six-tube Receiver. The mahogany cabinet of unobtrusive beauty is the type that many people prefer. Without accessories. $65

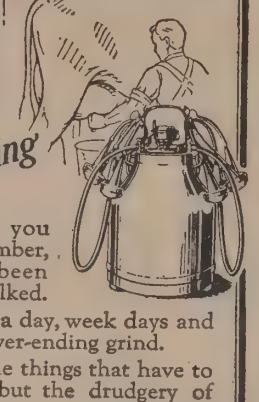
Why Milk in Schools

Six reasons why milk service should be in schools are given as follows by M. O. Maughan, secretary of The Milk Council:

1. Milk service in the schools helps keep the children who are normal in a healthy condition.

2. Milk service in the schools helps overcome undernourishment among the children. Results speak for themselves.

3. Children who participate in the milk service regularly, generally do better school work than otherwise.



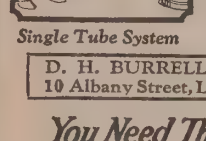
4. Milk service affords a splendid opportunity for a tie-up between teacher and parent.

5. A bottle of milk at school helps make up the proper and standard amount, namely a quart a day.

6. A bottle of milk in mid-forenoon serves to prevent children getting over-hungry before lunch time and thus prevents eating to excess and causing sluggishness during the afternoon.

It Milks the Cows
CLEAN

Say Good-bye to the Drudgery of Hand Milking



EVER since you can remember, there have been cows to be milked.

Always, twice a day, week days and Sundays, a never-ending grind.

There are some things that have to be tolerated, but the drudgery of hand milking is not one of them. You can say good-bye to it forever. And, the time you save will pay big dividends on the investment. You just can't afford to milk by hand.

The Burrell Milker has enabled thousands and thousands of farmers to take the drudgery out of dairying and increased their profits at the same time. It will do the same for you.

Single Tube System

It will milk your herd easier, quicker, better and more safely than hand milking—and *It Milks the Cows Clean.* And that is why you'll finally come to a Burrell.

Holds Banquet

HOARD'S DAIRYMAN:—After completing seven months of this year's test the members of the Erskine—McIntosh Association of Minnesota held a "get-to-gether" banquet at the Leland Hotel at Erskine. A big majority of the members were present, many bringing their wives. Thirty-seven people in all were there and a jolly bunch they were. A splendid banquet dinner was served by the hotel management and those who had lunched at home before coming were decidedly at a disadvantage.

The president of the association, Mr. Magnus Haaven, welcomed the members with a short talk touching lightly upon the object of the association and the results of testing. The Northwest School of Agriculture was represented by Professor O. M. Kiser, who talked on "General Farm Problems." Other speakers were Mr. E. O. Melness, vice-president of the "Land O' Lakes Creameries," and Mr. Albert Anderson, former Erskin buttermaker and now editor of "The Creamery Operator." A number of vocal solos were sung by Miss Ruth Melquist, accompanied at the piano by her sister, Genevieve.

An enjoyable evening was spent, music, humor, and short talks making the time fly. The banquet gave the members the opportunity to talk things over, compare notes, and become better acquainted. This has been instrumental in creating that friendly feeling in which co-operation thrives so well. All those attending could not help but feel that the association in general and the banquet in particular was a success in every respect.

MORRIS C. GROVE, Tester.

Raises All His Feed

HOARD'S DAIRYMAN:—Soy beans make it possible for one dairyman of the Henry Association of Illinois to feed all home grown feed to dairy cattle. Last year the cows received only feed produced on his farm. Corn, barley, and oats furnished the carbonaceous concentrates and soy beans furnished the nitrogenous concentrate. The roughage consisted of alfalfa hay and corn silage.

The beans yielded very well, making 27 bushels per acre this year. The choice beans are sold on the market for seed, the cracked beans are ground for the cows. The butter produced from beans seems to be somewhat soft, but this is not objectionable to him as he does not produce butter for the market. The beans seem to have a very good physiological effect on the cows due to their high percentage of oil.

The yearly average of this herd was 9,752 pounds of milk and 307.2 pounds of butterfat. Each cow returned an average of $106.90 above the cost of feed. The feed was figured at current prices at time of consumption. The cows consumed an average of 200 pounds of beans per he yearly. It takes approximately tw tenths of an acre per cow to furn this nitrogenous concentrate. In t section of Illinois it seems to be most profitable crop to produce p tein concentrate for cows.

JESSE L. BARNES, Tester

The Need of Testing

HOARD'S DAIRYMAN:—Many dai men or farmers that keep cows w der what is the use of testing. Is t not due to the lack of a thorough derstanding of its principle val Are they willing to feed high pri feed to inferior or unprofitable co thereby lowering the value of th feed? Why put feed into a cow anything else that will not bring farmer a fair return above the c of production? Time, labor, and pense are only wasted.

Early in the summer the county ricultural agent and myself called a farm where they were milking th teen cows. It took considerable eff to get him to join the So. Kent As ciation of Michigan, but he fina signed up. Through testing he fou several cows producing at too low standard to keep this winter. He s six of these and is now milking sev He now asks, "Why will a man k twice the cows that he should wh he can produce just as much with h the cows and thereby save nearly h the feed, labor, and expense?"

The secret of dairying is not keep a large herd of cows but fe and better cows. When farmers realize this fact the matter of ov production will be a thing of the pa Let us all get behind the dairy h improvement association and h boost dairying.

FORREST BENDER, Tester

Accuracy of Records

HOARD'S DAIRYMAN:—There been some question among memb of dairy herd improvement assoc tions as to the accuracy of their r ords on account of the practice computing the month's producti from one day's actual producti This has been checked by the m sheet records by various members the Genesee No. 2 Association Michigan and found to be very cl to the actual production, one mon with another.

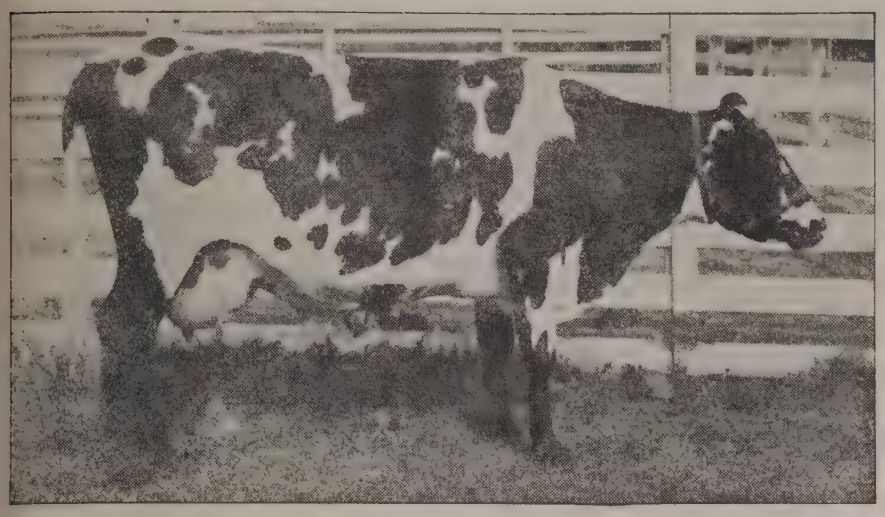
One member recently figured t actual production from his m sheets for the entire year on his he of 21 cows. In terms of the value the product according to the price received for milk each month the was $3.59 difference between his to and the total value of the product shown by the herd association recor This was an average of 17 cents p cow on the year's production.

A. D. REYNOLDS, Tester.

Helpful Hints

In his annual report as tester the Thiensville—Lakefield Assoc tion of Wisconsin, James Rezach cludes the following comments:

"A hen does not stop scratching cause the worms are scarce. S scratches just so much harder to a living. Do not quit the dairy herd i provement association when the he average is a little lower; work much harder to make it better."



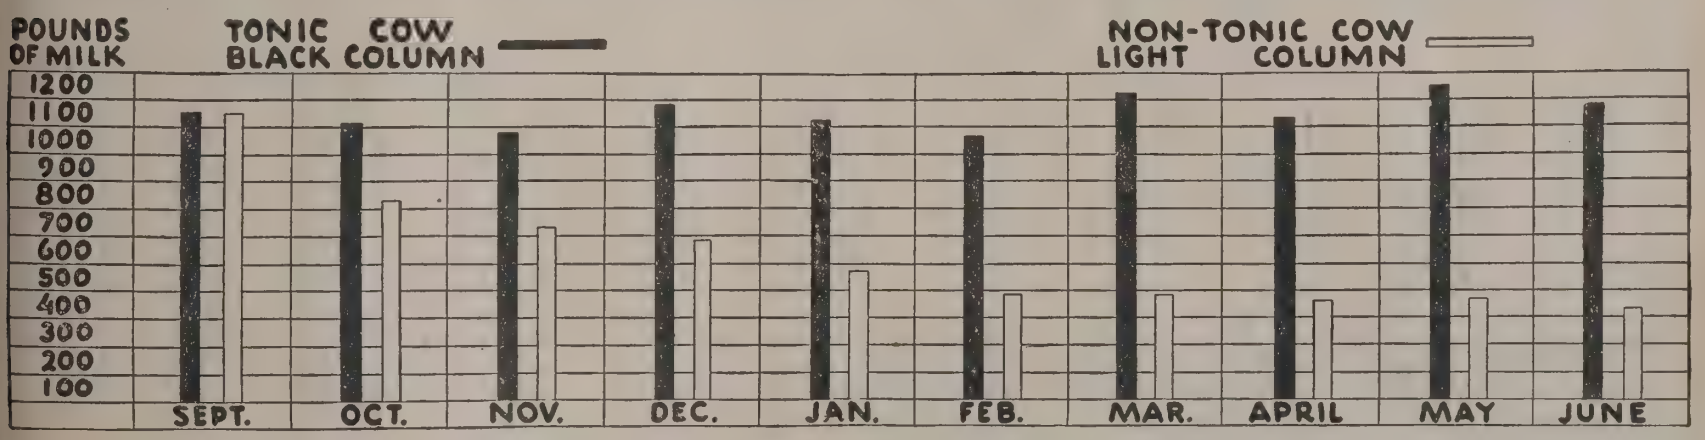
"It is not the spurt at the start b the steady advance that wins succes Do not try to do it all at once. St from the bottom up and not from t top down."

"If you do not have sufficient fe reduce the number of cows or procu the feed. Remember, no man ev cheated a cow without she retaliat with heavy costs."

BULLETIN

Milk Production Record of Two Cows for 10 Months

Research Farm, Dr. Hess & Clark, Inc., Ashland, Ohio



This is just an ordinary milker, getting ordinary care and feed—ground oats and corn, bran with oil meal added. She freshened in August and began to receive Dr. Hess Improved Stock Tonic in her ration in September. This continued for ten months. This cow and the one below were rated equally good milkers, there being but two pounds difference in production in September when the test began.

This cow might well be in the same class as the cow above. She was of the same age and condition. She got exactly the same feed and care. She freshened the same month. No reason is apparent in age, condition, feed or care why her production should not equal the other cow. But she did not receive Dr. Hess Improved Stock Tonic at any time, either before or during the test.

THE above two cows were placed in competitive milk production test beginning September 1st and continuing ten months. For better comparison, the milk production records for both cows are given month by month in the graph below.

The outstanding feature of the test is the sustained production of the Tonic cow. Instead of falling off the usual 10% a month after freshening, as the other cow did, she maintained her milk flow until the end of the test.

Production for the ninth and tenth months was greater than the first month after freshening. Compare the graph records of the two cows closely. The Tonic cow's total production was 10,493 pounds—that of the non-Tonic cow, 5234 pounds.

The Tonic cow was kept in better milking trim, in condition to do her best, remained longer in full milk than the usual course, and thus was able to produce a little more than double the milk of the cow not receiving the Tonic.

The average butter fat test for the Tonic cow was 4.67%, for the non-Tonic cow, 3.73%.

The average monthly profit from the Tonic cow was $21.10, for the non-Tonic, $3.55. The total profit from the Tonic cow over and above the feed cost was $210.97; total profits from the non-Tonic cow, $35.46.

How many are 421,000 stockholders?

An Advertisement of the American Telephone and Telegraph Company

ON OCTOBER 15th, American Telephone and Telegraph Company checks representing the 152d dividend were mailed to its 421,000 stockholders. That is the largest number of stockholders of any company in the world.

The American Telephone and Telegraph Company is owned by a great investment democracy.

Its dividend checks are cashed at banks in every state in the Union, by people representing all trades and stations and professions.

No institution is more nationally or publicly owned than the American Telephone and Telegraph Company, which in turn owns more than 91% of the common stock of the operating companies of the Bell national System.

The average holding is 26 shares, and no one person owns as much as 1% of the total stock.

The Bell System was developed in the interest of telephone users and is owned by the public that it serves.

"The Truth Hurts"

National Dairy Council's Butter Exhibits Arouse Ire of Margarine Manufacturers

AS a result of the regular summer activity of the National Dairy Council in scheduling exhibits of scientifically fed experimental rats at state and county fairs, in store windows, and other strategic locations throughout the Middle West, an organized defense is under way sponsored by margarine manufacturers to offset the inroads on public opinion which these exhibits create against margarine.

For many years the National Dairy Council has maintained an experimental animal station near St. Paul, Minnesota. White rats, chickens, dogs, and pigs, raised in pairs of the same age, sex, and breeding, have been raised on special diets to show the advantage of milk and butter as necessary food in a proper diet for growth and health. The diets are prescribed and supervised by a leading nutrition authority of the University of Minnesota.

Exhibits are Widely Used

Each year an increasing volume of inquiries has taxed the capacity of the experiment station to supply these exhibits. One of each pair of animals has been fed on a basic diet plus butter and another fed on the same basic diet plus margarine. Anyone familiar with the difference in food value of these two products can predict the results which follow. The surprising fact about these experiments has been that in hundreds of cases the same diets have produced almost identical effects on the animals.

Crowds of people both from cities and farms have always gathered about the display of these experimental animals at meeting places or in store windows. At the same time the National Dairy Council supplies publicity matter for local newspapers reaching many thousands of people who do not see the animals in person. They are told about the diets and their effect upon the animals, together with a statement showing what the same results will be in the growth and health of human beings on a similar diet. Not only have the hundreds of exhibits created considerable discussion among those who witnessed them, but in many cases the Dairy Council secures letters and verbal inquiries from those who have heard of the exhibits indirectly from those who have seen them.

"Butter Made the Difference" is the slogan in large letters which always catches the eye over these exhibits. This same slogan is usually the headline for local publicity above the attraction.

"Oleo" Manufacturers Object

It is not surprising, when the cumulative effect of this widespread publicity is considered, that the margarine manufacturers should become alarmed. Reports have come to the National Dairy Council of a concentrated effort on the part of the manufacturers to put the "quietus on this source of information to the general public, particularly in the Middle West. Letters are being sent to state and county fair managers and to others whom the "oleo" people expect to be responsible for the display of this exhibit showing what butter will do that margarine cannot. Direct contact through the local representatives of margarine manufacturers is beginning to result in pressure brought to bear on business men and fair managers, calling upon them to stop the spread of what they seem to regard as effective against their business.

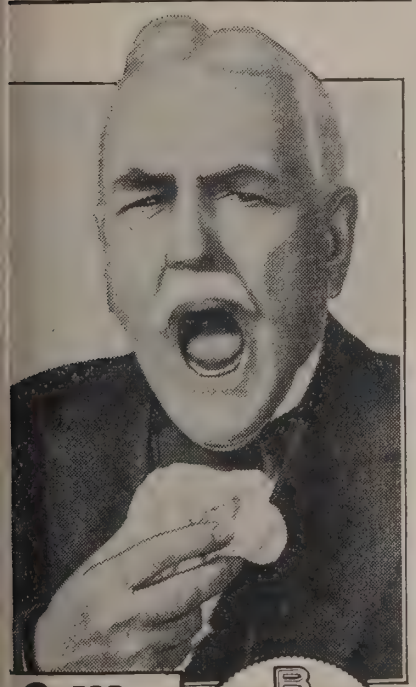
To show how effective these exhibits have been against the margarine sales in localities where people have been informed, surveys have been made of the market situation by local county agents in a disinterested capacity. At Indianola, Iowa, Claude S. Halderman, County Agent of Warren County, made a partial check of the amount of butter and oleomargarine sold by local merchants in Indianola the week previous to the showing of the experiment at the county fair and another the week following.

"I found," reports Mr. Halderman, "that there were approximately 2 pounds of oleomargarine sold through the merchants to every pound of butter. It was very interesting and gratifying to find that the merchants are selling now only 1½ pounds of oleomargarine to every pound of butter. I would like to have this same exhibit next year."

Essential Food Elements Lacking

The Institute of Margarine Manufacturers has unconsciously stated what follows when margarine is used in a basic diet in its protest "against the exhibition of sick rats or other sick animals in connection with oleomargarine and butter." The sick condition is not caused by a contagious disease, but is the direct result of malnutrition resulting from the use of margarine in place of butter. The malnutrition, in turn, is accompanied by a lack of resistance to disease

Farmers' Co-operative Creamery, Sunberg, Minn., sells its butter to the Atlantic and Pacific Tea Co., New York, and receives extra price. In 1924, 250,000 lbs. butter were made.



hich in the end often results in an nfection of one form or another, as)r. Amy Daniels of the University of owa found in her experiment work rith rats where oleomargarine was sed in place of butter.

Food is intended to build body tisue and furnish the body with energy nd it is not intended to make either ats or human beings sick. But a soalled "food" like margarine, by reason of its lack of essential food elements, can and does produce a condition which is a form of sickness as he Council's exhibit has shown thouands of people in a striking manner.

The statement in the complaint of he Margarine Institute, that "it food) does not prevent growth and evelopment" is misleading. Food is, y nature, intended to promote rowth and development. Margarine ecause it lacks growth promoting elements, does not promote growth and, herefore, its use does prevent growth ausing the very thing which the Margarine Institute says "food" hould not do. It can be truthfully aid there is "food for thought" in his shallow protest of the Institute f Margarine Manufacturers.

The National Dairy Council will ontinue to inform the American pubc in its effective displays as to the elative food value of butter versus nargarine. Many who see these xhibits exclaim to each other: "No nore oleo for me!"—National Dairy Council.

More than 7,500 patrons of 275 actories located in 45 counties in the wo leading dairy states are now marketing their cheese through the Wisonsin Cheese Producers' Association.

To break a cold harmlessly *and in a hurry* try a Bayer Aspirin tablet. And for headache. The action of Aspirin is very efficient, too, in cases of neuralgia, neuritis, even rheumatism and lumbago! And there's no after effect; doctors give Aspirin to children—often infants. Whenever there's pain, think of Aspirin. The genuine Bayer Aspirin has Bayer on the box and on every tablet. All druggists, with proven directions.

Physicians prescribe Bayer Aspirin; it does NOT affect the heart

Aspirin is the trade mark of Bayer Manufacture of Monoaceticacidester of Salicylicacid

Middlesex Ayrshires Sell Well

Ayrshire breeders went home from the dispersal sale of the Middlesex Meadows herd of Major A. Henry Higginson at Westport, N. Y., October 28, with a firm conviction that the public is eager to purchase improved Ayrshires at remunerative prices. The offering of 52 head including three bull calves, several baby heifers, and the usual dispersal sale quota of old cows was readily absorbed at an average of $296. The crowd was large, the cattle nicely fitted, and the bidding spirited.

For nearly fifteen years the cattle of Major Higginson have been conspicuous in the show rings and in the Advanced Registry, and champions in both of these endeavors have resulted. Ayrshire breeders will be gratified to know that a nucleus of the youngsters has been reserved and that just as soon as barns are rebuilt and forage produced an even greater herd is planned for Middlesex.

Winthrop Taylor, New York, topped the sale with a bid of $800 for Imperial Mayflower, a consistent prize winner on the 1926 show circuit, that has a senior three-year-old record of 14,057 pounds milk, 614 pounds fat. Mr. Taylor personally selected six very choice animals for his estate, including the two-year-old Middlesex Snowbird at $785, undoubtedly one of the most popular animals in the offering.

The estate of Seymour H. Knox, New York, took five head including the good yearling show heifer, Middlesex Carmencita, at $485.

L. L. Grow & Son, New York, selected ten choice heifers for a total of $2,590 and Henry L. Higginson, who has been quietly acquiring a select herd on the estate formerly occupied by the Middlesex herd in Massachusetts, purchased eight females for a total of $2,900.

Averages for animals of different ages were as follows: Seventeen cows averaged, $384; 8 two-year-old heifers, $428; 11 yearling heifers, $261; 8 heifer calves, $163; 3 bulls, $232; and 5 bulls, $126.

Herdmen's Short Course

Young men who would like an opportunity to spend the winter months (January 2 to March 16) preparing themselves to qualify for something better should be interested in the Winter Live Stock Short Course offered at Iowa State College at that time. This course is known as the Herdsmen's Course and consists of two winter quarters' work which may or may not be taken during consecutive winters.

The Herdsmen's Course has been found to fill a very definite need for the farm boys of the Middle West who do not feel that they can spare more time to take the longer collegiate or non-collegiate course in agriculture. It has attracted an ever-increasing number of very fine boys from over a rather wide area during the last few years. One year as many as thirteen states and Canada were represented by students enrolled in the course.

Many new cow testing associations are being organized in Iowa and adjoining states and the success of the work is largely dependent on the type of men employed as testers. One of the chief objects of the above mentioned course is to help train men to take up this line of work. This is the only course of its kind offered at Ames with this end in view and it occurs at a time of the year when men and boys can best leave the farm.

For further information, write to the Dairy Husbandry Department, Iowa State College, Ames, Iowa.

"..... Over 80% of shipments of milk *and* cream *in* cans moving on our line are now supplied with Parchment Gaskets....."

The Farmers' Best Investment

TEN years of increasing strength of the Federal Land Banks have made their Bonds a seasoned standard investment. Not a default on interest or principal. Over one Billion dollars of these Bonds now held by investors. They are guaranteed jointly by the twelve Federal Land Banks, with combined capital and reserves exceeding $70,000,000. Back of these Bonds are farms valued at more than twice the amount loaned. These Bonds are safer than any single first farm mortgage.

Federal Land Bank Bonds

Completely Tax-Exempt

You can buy Federal Land Bank Bonds at the current market price from any Federal Land Bank or from the Fiscal Agent. Denominations: $40, $100, $500, $1,000, $5,000 and $10,000.

When you need money these Bonds can be readily sold; and they make acceptable collateral.

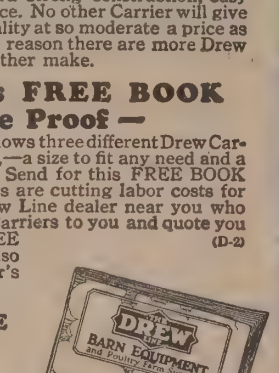
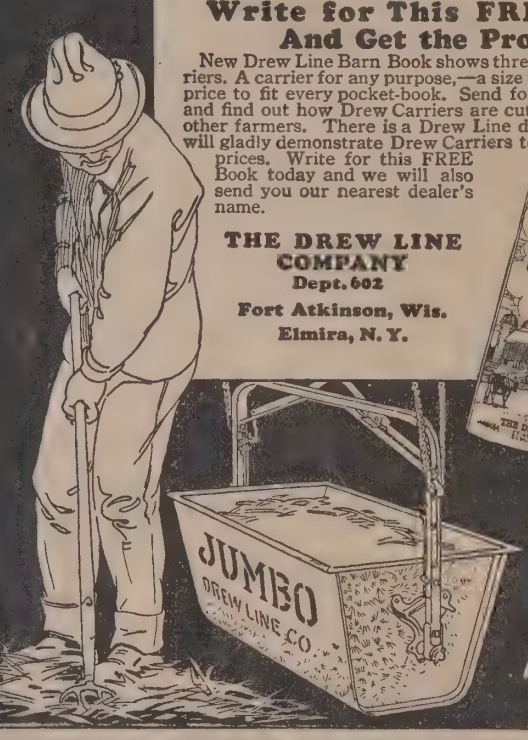
DREW LINE

Litter Carrier in Your Barn Will Pay for Itself the First Year

Put this world-famous Drew Litter Carrier in your barn and it will cut your chore time in half. A Drew Carrier will relieve you of the hardest job on the farm—the back-breaking drudgery of handling manure and cleaning up. It will increase the value of your fertilizer and give you a cleaner, healthier barn and healthier stock. Throw away your old fashioned wheelbarrow and put in a Drew Carrier. It will pay for itself easily the first year in the time and labor it saves you and the satisfaction it gives in enabling you to keep your barns clean with little work.



For Over 27 Years
Highest in Quality—Lowest in Price



Away back in your Dad's day the Drew Carrier earned its reputation of being the best on the market. Today it still holds that same good name, for extra strong construction, easy operation and long-lasting service. No other Carrier will give you as much real value and quality at so moderate a price as the Drew Carrier. That is the reason there are more Drew Carriers in use today than any other make.

Write for This FREE BOOK And Get the Proof—

New Drew Line Barn Book shows three different Drew Carriers. A carrier for any purpose,—a size to fit any need and a price to fit every pocket-book. Send for this FREE BOOK and find out how Drew Carriers are cutting labor costs for other farmers. There is a Drew Line dealer near you who will gladly demonstrate Drew Carriers to you and quote you prices. Write for this FREE Book today and we will also send you our nearest dealer's name. (D-2)

MILK STOOL PHILOSOPHY

J. J. SPRENGER, MINNESOTA

I BELIEVE I would make a good millionaire. I feel I have all the longing for prosperity and all the inclinations to spend money and be extravagant, needed by the best of them. It is only a trifling thing I lack—the money. But, being a farmer, I don't expect to get much wealth but I do expect to be happy.

Farmers are usually well-to-do but not wealthy. We live forehanded lives but seldom live in luxury. We succeed oftener in keeping our credit good at the bank than the rank and file of any other group, but we are not rich. I am not sorry that this is so, but I am sorry our credit is not quite as good as it has been. I am glad we are trying to get back because I believe we will get something out of that trying which we could not have gotten without it.

You will not need to have me tell you why we slipped a little, because everybody is already doing that. I would, however, like to tell you in a modest way about some of the things which are helping me to get back.

When it became evident that a man could produce ever so much more farm products in a given time than before he had the endless string of labor-saving machinery, it showed me that our difficulties might be increased along the line of marketing the increased quantity of products, especially at a time when so many consumers had been made poor by the war and by many other destructive agencies throughout the world. It was then that we were in need of wisdom as to the best way of meeting this new condition, and there were developed two schools of thought. The one believed the best way was to slack up so the people we were fee ing would become more liberal wi the buying power they did not hav the other school thought we mig get back by working harder and mo carefully so as to produce cheap until our weakened customers cou get on their feet and then we wou finally both be in a better position.

The people of the first school thought certainly have the argume which would appeal to the mass, b I could not see it that way. All m observations of the past point to o thing especially, and that is that the end it always pays to do our ve best. A farmer can not do that unle he throws himself, soul and body, i to his work. So the first thing I d was to extend my work so that su labor-saving machines as had prov practical could be used to the be advantage. However, had I been a small farm, I would have intensifi for the same reason because I belie there is an advantage to be gained separating the two kinds of farmi in our minds, the intensive and t extensive, because the methods of t one are not the methods of the othe

Then the second thing I did was sell products only in the form human foods because animal foo are not as much needed in a mechan cal world. In the third place, reasoned that new problems alwa look bigger to the masses and thou everybody talks about surpluses, v end each year with practically no ca ry-over of food products and at th time there is a profitable market.

But above all, I enjoy my work. have confidence in economic adjus ment and believe there are gre things in store for the progressi farmer.

Creamery Pays For Itself In Three Years

HOARD'S DAIRYMAN:—When a few farmers around about Luana, Iowa, 37 years ago met and organized the first co-operative creamery in North-

THE NEW LUANA, IOWA, CREAMERY

eastern Iowa, the venture met with considerable skepticism. There were those who said that the farmers never would hang together. Another doubtful feature of the situation was the lack of dairy cows and the preponderance of beef cattle on prairie farms around Luana at the time.

The creamery had its ups and downs, more downs than ups at first, but carried on. Then a day came when its butter began getting premiums in eastern markets.

For a good many years now it has done a huge business, but for a long time the farmers held off from investing in a new building, though the business had outgrown the old frame structure. Three years ago, however, the stockholders voted in favor of a new modern tile building, and it was agreed that each and all should leave a cent a pound on all butterfat receipts in the creamery exchequer until the building was paid for.

That was in 1925. The building was completed last year. It cost $20,000. It is already two-thirds paid fo and the entire debt will be wiped o by the first of January, 1928, sa Elliot Nelson, secretary.

The little creamery which dared be co-operative nearly forty years ag made over three-quarter millio pounds butter last year. Its June re ord for this year was 84,110 poun butter, and checks totalling $32,0 were paid out to the 320 patrons.

Since the new building has been o cupied, the creamery has made son changes in its management. Individ al cans are used this year for t first time. If cream comes in bad t farmer is notified. If it comes in b from the same farm again, the crea ery reserves the right to reject it f their own use, and to ship it to a ce tralizing plant. Secretary Nels says they have not had to resort this measure.

The Luana creamery is about fo miles from the farmers' creamery Monona and around six miles fro the farmers' creamery at Postvill Both the Monona and Postvil creameries do a big business, the san as the one at Luana. Rivalry w made taboo by the three creameri some time ago when the directors the institutions held a joint meetin and agreed that no patron of one the creameries would be accepted either of the others.

Iowa. F. L. CLARK.

"Ah shuah pity you," said a color pugilist to his opponent as th squared off. "Ah was bohn wi boxin' gloves on."

"Maybe you was," retorted the ot er, "and Ah reckon you'se goin' to d the same way."

It is never too late to read.

Built for Hardest Winter

Here's an arctic that's built for workers.

Uppers of heavy, tough cashmerette —to give double wear.

Lined with thick, warm fleece for northern weather.

Tough soles with an extra red rubber reinforcement where the hardest wear comes. Bumper-edged for rough going on frozen ruts.
Try and wear 'em out!

The Hood name across the sole shows the maker's pride in these arctics. Ask for them by name—Hood Red Treads. Other styles for all the family offer the same plus value. Look for the Hood Arrow—and save money.

HOOD THE SYMBOL OF WORLD WIDE SERVICE IN QUALITY RUBBER PRODUCTS

The Fire Died at Midnight!

Cold gray dawn. Windows covered with frost. Dead ashes in the old stove. What a dreary way to start the day!

Even after the fire is started, corners will be cold all day. Floors drafty. Mother will keep a shawl over her shoulders. Baby will have snuffles. Cold feet a habit with the whole family.

Junk the old outfit and get one that is up-to-date.

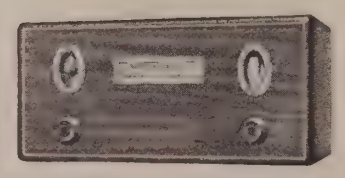
YOUR family is entitled to modern heat in the house. There's no need to freeze at night and shiver in poorly distributed heat all day. A modern outfit will fill the house with mellow warmth, will glow with comfort all night, utilizing all possible value from the fuel instead of sending it roaring up the chimney.

When you buy a new outfit you want results and economy. Turn to a manufacturer who has worked out designs from years of study and experiment. Trust an institution where every man is proud of the company's reputation, from executive in the office to molder carrying splashing crucible of white-hot metal. Such are the advertisers in this paper. They make good equipment and their guarantee counts.

Steady warmth that circulates, leaving no cold corners, will keep the family vigorous and full of hustle, without the dragging handicap of colds. All this, yet economy that keeps your pocketbook cheerful.

Firepots carefully cast, with metal compounded so they will not warp, crack or burn out, doors accurately machined so they fit, solid character and sound design in every part. That's what you want to buy.

You Can Depend on the Heating Systems Advertised in This Paper



It pays to own a genuine Radiola

WHEN you buy a Radiola (and an RCA Loudspeaker) you know that you are getting the best in radio.

Back of every instrument bearing the RCA trademark are the resources, not only of the pioneer and leader in radio research—the Radio Corporation of America—but also the pioneers and leaders of the whole electrical industry—the General Electric and Westinghouse companies.

Three radio instruments designed by the engineers of these companies are specially adapted to give perfect radio reception and reproduction in communities away from the congested centers of population.

RADIOLA 16—Storage battery receiver of great compactness. For selectivity, sensitivity and tone quality, it sets a new standard for receivers in its price class. The cabinet is finished in mahogany.

Less accessories	$69.50
With Radiotrons	$82.75

RADIOLA 20—Dry-battery-operated receiver, with amazing sensitivity and many times as selective as the average antenna set. Ideal for distant reception. Can readily be adapted to socket operation. Ideal to use with the new RCA Loudspeaker 100-A.

Less accessories	$78.00
With Radiotrons	$89.50

These are the new, compact, storage-battery operated Radiola 16, the popular dry-battery operated Radiola 20, and the new RCA Loudspeaker 100-A.

Either of these fine receiving sets, when used with the wonderful new loudspeaker, will faithfully reproduce the programs from the great broadcasting stations—the best music, university extension courses, crop and weather bulletins, and the news of the world. And either of these sets can be adapted for operation from the electric light circuit by the addition of socket power devices.

RCA Radiola

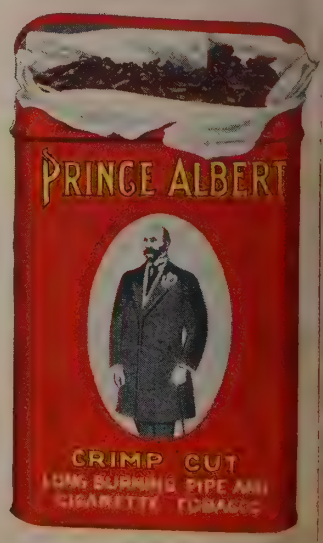
I call this living!



A PIPE and P. A.—what a wonderful combination for pleasure! I often read about "what ten books" a man would choose for companionship if he had to spend the rest of his days on a desert island. I'd want books, of course. But the thing I'd insist on would be a warehouse full of Prince Albert!

I would never be lonely anywhere with my pipe and plenty of P. A. In fact, I'd be lonely in a crowded city *without* them. You'll begin to understand "why" when you get that first fragrant whiff of Prince Albert as you tamp it into your pipe. You'll know for sure when you light up.

Cool as a referee. Sweet as a decision for *your* side. Mild as cambric tea. So mild that you can smoke pipe-load after pipe-load without a stung tongue or a parched throat. Yet P. A. has that rich, full tobacco-body that satisfies to the limit in every pull. A grand old smoke, Men.

I don't know what your present smoke-program is and I'm not going to ask questions. But I'm going to state in no uncertain terms that you don't know how good your pipe *can* taste until you load it to the brim with long-burning P. A. Millions of other contented jimmy-pipers will tell you the same thing. Why don't you find out for yourself?

P. A. is sold everywhere in tidy red tins, pound and half-pound tin humidors, and pound crystal-glass humidors with sponge-moistener top. And always with every bit of bite and parch removed by the Prince Albert process.

PRINCE ALBERT

—the national joy smoke!

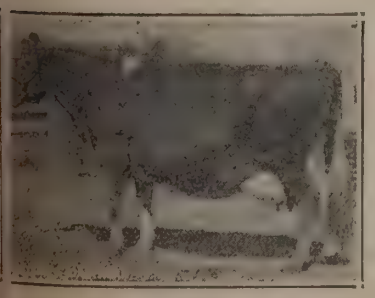
Seasonable Live Stock Notes

N Indiana subscriber in a recent letter after telling us about the results of the benevolence of ridence and his good management the year 1926 concludes with, s year if nothing happens we will s well if not better than last year. at yielded 29 bushels per acre; 47 bushels; corn, 65 bushels; po- es, 300 bushels. Everything look- fine and doing well."

eading between these lines we see xpression of the spirit of the sea- This dairy farmer is thankful bountiful harvest; he is content- ith his opportunity to live in the country and work with nature ie production of crops and in the andry of good live stock. He ap- ches Christmas time with that t of good will that has perpetu- the gift of a great man for near- ,000 years.

Cleanliness and Customers

producer of market milk writes say that his customers complain n undesirable taste in his milk to ask by return mail what can o about it.



"seasonable live stock notes" may ade to include the care of milk in out of the cow barn, may we sug- under winter housing conditions cleanliness is a great factor in fying customers. We realize that all undesirable flavors in milk from uncleanliness but a great y of them do come of this cause. odors, dirty flanks and udders, less cleaning and sterilization of sils, and failure to properly cool all may contribute to undesirable rs in milk. Bad habits of barn agement are worth breaking if would satisfy our customers.

egume Hay Essential Roughage

few weeks ago we listened to a rer on foods and their combina- with respect to human nutrition. ing the talk the speaker cited an riment with rabbits in which a n of alfalfa hay and cereals fed to one group and a ration cereals alone fed to another p. The experiment was to have inued for two years but at the of 14 months the rabbits receiv- cereals alone had all died, where- hose in whose ration alfalfa hay fed continued in normal health. t this time winter feeding is in swing. The roughage part of the y cow's ration is of great impor- e. Furthermore, we are inclined he opinion that good quality le- e hay is the most important part ny roughage combination. Feed ty of good roughage.

o They Drink All They Need?

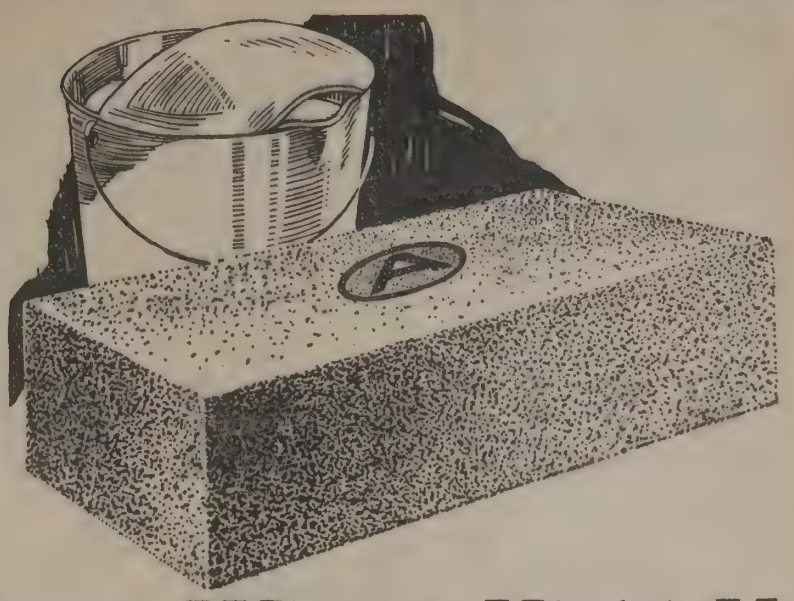
hen icy winds sweep out of the thwest it's a great satisfaction to v that water is being offered to herd under conditions that the nals will drink all they need. It has been repeatedly demonstrated that cows adequately fed and capable of producing large quantities of milk will restrict their production when, for any reason, they are not persuaded to drink all the water they need. Ice cold water is one reason for restricted production of capable cows.

rleen's Byrl of Meadow Brook, the h highest producing pure-bred Guern- cow in the world for class AA (ma- e cow, carrying a calf for 265 days of year's record). She was bred and de- ped by William Bock of Wisconsin and duced 12,842.7 pounds milk and 841.9 nds fat during the year.—The Ameri- Guernsey Cattle Club.

A Shortage of Feed

A letter from a subscriber indicates a shortage of roughage for the winter needs of the herd. Plenty of silage is available but the hay is limited to only about half enough and it is of inferior kind to be fed with silage, being mostly timothy. Shock corn can be bought locally or alfalfa hay may be shipped in. We advised buying the alfalfa hay on the basis that to feed silage, timothy hay, and shock corn would require the purchase of comparatively large quantities of high protein concentrates to be mixed with home grown grains. We also advised the elimination of low producing cows, if any, as one means of putting the limited amount of feed to the best use. Now is the time to plan how to overcome the handicap of a feed shortage.

Feeding Calves on a Minimum of Milk



A Kansas subscriber wants to know how he can get his calves from birth to a full ration of roughage and grain on a minimum of milk. His safest procedure is to start the calves on whole milk, leaving them on this for about 20 days and then gradually substitute powdered skimmilk for the whole milk. The powdered skimmilk is mixed with water in the proportion of one pound of milk to nine pounds of water; it is fed warm or at a temperature of 98 to 100° F. One should take at least 10 days to make the complete change from whole milk to powdered skimmilk. At 30 days of age one should place equal parts of ground grain, such as corn and oats, before the calves as also hay, preferably clover, alfalfa, or mixed hay which is at least 50 per cent clover or alfalfa. The powdered skimmilk should be continued until the calves are at least six months old. After calves are accustomed to grain they will do just as well on the whole grain up to six months of age as on the ground grain.

Give the Hogs Some Hay

Two important swine problems come to mind as being important at this time. The first is that of suitable rations for pregnant sows; the second is that of suitable rations for fall pigs. The most common fault in feeding either the sow or the shote is that the ration is confined too closely to the cereal grains. Try some alfalfa or clover hay this winter along with cereal grains. It protects fall pigs against rickets and insures the birth of strong, large pigs from the sows. Besides, it's a very good way to supply protein and some minerals.

Fitting the Flock to the Floor Space

The tendency in housing poultry during the winter is to place too many chickens in a given space and for that reason we suggest now as a good time to cull the flock, removing all diseased birds, if any, and such others as are so poorly developed that they will not come into laying until March or April. On many dairy farms the dairy herd has first claim on the grain feeds available and this is a good reason why the poultry flock may well be restricted to the better birds that can be more comfortably housed and adequately fed.

Keep Winter Yield Up

Comfortable, healthy cows don't "fall off" in winter. It is only when they are *uncomfortable* from cold and dampness, or when they are sick, that their yield decreases.

One of the surest ways to protect health and to prevent a diminished yield is to floor every stall with Circle A Cork Brick. They make a warm, dry and thoroughly sanitary floor that is nonabsorbent, nonslippery and decidedly comfortable to stand or lie on. They *insulate* your cows against the chill and dampness of the ground and conserve their natural bodily warmth.

Circle A Cork Brick are not a luxury but a downright necessity for every herd, no matter how small it may be. They are so economical and so easy to lay that every dairyman can easily afford them. Write for the illustrated book, "Circle A Cork Brick" and for a sample brick. Both will be mailed free on request. Address ARMSTRONG CORK & INSULATION COMPANY, 112 Twenty-fourth Street, Pittsburgh, Pa.

Thoughts From National Grange

O other farm organization has served the American farmer continuously as long as the nge. Its sixty-first annual meet- was held recently at Cleveland, , at which time Louis J. Taber, ter, presented in his annual ad- s many of the problems signifi- of Grange activities. We pre- extracts of the more important cs from Mr. Taber's address:

Agriculture's Future

Much that will never happen is licted about the farmer. On one eme we are told that peasantry is ad for rural life. On the other, America will go hungry because farmer has failed to keep step mechanical progress. Each ap is in error.

Peasantry will never come in erica unless American agriculture the government become incom- ibly stupid and shortsighted.

When it comes to the danger of erica going hungry, again the fear groundless, unless stupidity and ow policy guide the nation's agri- ural destiny. We have the acre- ; we have the man power; we have scientific resources and we have mechanical equipment to feed and he all who will live in this Repub- for centuries to come.

Our Big Problem

There are big problems before us his period of change and readjust- t, not only in agriculture but in y avenue of life. Numerically, culture has moved from the ma- ty to the minority side. Our farm ulation will further decline. All iencies of life are toward organ- ion, and agriculture will find itself elessly handicapped unless it ts organization by organization.

Farm organizations must continue grow. Whenever more than 50 cent of our farmers are organized, problems will begin to disappear. hey are social or educational, we have sufficient membership to ect them. If they are economic, will have the numbers and finances their adjustment. If they are slative, there will be the numerical ngth to insure correction.

Present day inequalities are not result of any desire to injure ag- lture for the benefit of other ups, but remain because the farmer been unable thus far to utilize the e agencies that have been effec- in the nation's commercial affairs.

Export Debenture Idea

The export debenture idea as ad- ated by the National Grange one year ago, has received wide discussion and much favorable comment.

"This plan is a straight-forward, honest attempt to bring tariff benefits to articles of which there is an exportable surplus, and to do it in the simplest, most efficient, and economical manner, without the creation of expensive machinery or the introduction of agencies that might in the future be dangerous to rural life.

"When we read carefully the history of tariff legislation in America, we find that other groups have been seeking to take care of themselves, and as we analyze the methods and practices employed, we can but conclude that agriculture has neglected its own opportunity in this regard.

"It is entirely possible to make tariff adjustments so that the debenture plan would not cost the government a penny.

"The debenture is no more a subsidy than the operation of the tariff under many conditions. It can not be considered as class legislation or special favor to any one group. It simply seeks to remove inequalities and to bring to the basic industry the same tariff benefits enjoyed by others.

Present Day Problems

"Unfortunately, a number of well informed people have allowed themselves to believe that some type of farm relief legislation is the only matter of importance confronting rural life. This is a grievous error. Agriculture, like every other calling, must make a daily and continuous struggle to keep abreast of the times, to adjust inequalities and improve conditions. Co-operative marketing has had the support of the Grange from its very beginning.

"More important than marketing, however, will be the development of agencies to guide our production in a more intelligent manner.

Research

"The place of the chemist and scientist in modern civilization is outstanding. Every great industry has its research department. Much of the progress along industrial lines has resulted from painstaking study, by competent authority, of the intricate production problems. Recently, as a result of the Purnell Act, advocated by the Grange, there has been renewed emphasis placed on the economic problems of the farmer.

"We need research directed toward the finding of new uses for food products, other than as food for man and beast.

Taxation

"One of the heaviest drains on farm income during the past few years has been the increasing tax burdens, local and state. Economy, efficiency, elimination of waste, abolition of unnecessary offices, and cutting out of frills in government can assist in lightening tax burdens. Agriculture should cooperate with industry, tranportation, finance, commerce, and labor in seeking the honest, economical expenditure of public funds.

"Every state in the Union should have a debt control law that will prohibit borrowings for current operating expenses and limit the life of bonds to the life of the improvement purchased. Every state should have a workable budget law that will not allow the expenditure of money not collected with the fiscal period and that will require taxing officials to prepare budgets, and open them for public inspection and hearings before approved.

Respect for Law

"A danger signal that we cannot ignore is the growing disregard for law. With twelve thousand murders in the United States during the past year, we can appreciate the perils that threaten our welfare unless American people realize the gravity of present day apathy toward law and constitutional authority. A serious menace in this disrespect for law comes from the fact that many of our citizens are trying to choose which laws they themselves are willing to obey.

Citizenship

"A dark picture of present day tendencies is the fact that sons and daughters of those who died to secure the franchise for themselves and their children, do not go to the polls, exercise their right, and accept their responsibility. The decline in the number of those participating in our elections has been marked. In the last election, when we selected the chief executive, all of our congressmen, one-third of our senators, many of our governors, and practically all local and country officials, less than fifty per cent of the qualified electorate participated.

Education

"There is an old Assyrian proverb which tells us that 'The man who is the best educated, is the most useful; and the test of his education lies in his ability to serve others.' We doubt if modern thought has ever given a better test of education than this. 'Knowledge is power' and as our knowledge increases, our power of necessity increases, but unless that knowledge and power can be used in service for the good of others, the individual and the world are none the better because of the training and education received."

SILOS

Preserve Summer Pasture for Winter Feeding

Silage can be produced for $2.50 per ton. Two tons are the equivalent in food units of one ton of hay which has a market value of from $12 to $24 per ton. This is but one of hundreds of items of profitable information contained in this book.

Independent Silos

Triple Wall Tapestry Tile Wood Stave

Masterpieces in their respective lines. Used and endorsed by more than 40,000 farmers and stock raisers in the Northwest.

FREE BOOK

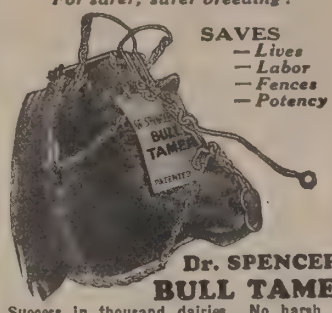
Just off the press and filled to overflowing with truthful information about Independent Silos and of vital interest to any farmer considering the purchase of a silo. This is the most complete manual on the silo subject ever published.

Write Quickly and Get your Free Copy.

BUY NOW-PAY LATER

No Money Down—Pay first installment next fall. Final payment in the fall of 1929 which can be paid with the extra profits the silo has made for you.

ROOF FRAME GIVEN



In order that we may get an early start in factory production for the big business we expect this year, a Hip Roof Frame will be given with all early orders. An early order will not change your date of payment or delivery, but will help us in our manufacturing departments.

Noah Lott — What Noah wants is more speed.

"Willie Just Has to Have His Own Way"

In a family where we used to visit, the youngest child was a boy named Willie. He was a good deal younger than the six other children and the meanest little boy I ever saw. His mother was a fine neighbor and the best natured person possible to imagine; everyone loved her but she had a grievous weakness and that was Willie.

She was famous all around the country for her good cooking and liked to please everyone with it—but most of all, Willie. She would plan things that she thought would please him and often work hard to make them only to have him push his plate away with a snarl and refuse to eat. Then, instead of taking him in hand, she would laugh in a comfortable, humoring way and say with a chuckle of pride, "Seems as if Willie's going to get there all right; he just has to have his way about everything."

All we knew in those days was that Willie was the most disagreeable child for miles around and that we other children despised him. Now I know that instead of disliking him we should have done a little thinking; then we would have seen that his mother was at fault for his yellowish eyes, his pasty face, and his wretched temper for she catered to a perverted appetite instead of making him eat wholesome, health-giving food.

The day of the whining child, picking and choosing his food, is happily passing and more and more we see round-faced, healthy youngsters eating food that would have thrown Willie into convulsions of rage. Mothers now know that their big job is to make their children into desirable citizens of the world and that right feeding is one of their biggest problems.

Miss Helen Parsons at the University of Wisconsin is a nutrition specialist who spends all of her time experimenting with foods and the results they produce in the body. She has recently worked out a card for scoring children in the matter of meals and already it has received nation wide attention.

Forty points are allowed a child who takes two pints of milk a day or one and one-half pints if a physician has advised this amount. If less than this amount is taken the child is allowed ten points for every cup. This includes milk taken in cooked foods as well as milk to drink. If the milk is skimmed the fat must be made up in the form of cream or butter.

For the right kind and right amount of protein each day the child is given 15 points. The child from three to six years of age should, according to Miss Parsons, have in addition to his milk one or two servings of the following foods: poached eggs if eggs agree with him, sponge cake, cottage cheese, custard, or a small helping of fish, chicken, beef, or liver. (It is not well to serve meat more than once a day but egg every day if possible.) Other protein foods which are good for him are: peanut butter, other egg dishes, and cheese dishes which have been cooked at a low temperature.

For eating two generous servings of vegetables other than potato he gets 25 points. Ten points are allowed the child who eats one generous serving of fruit (preferably fresh) each day. An additional five points is allowed if at least one of the servings of fruit or vegetables has been from the following list: fresh or canned tomatoes, raw, grated carrot or rutabaga, chopped raw cabbage, lettuce, oranges, or lemons.

Iron makes blood and if the child's diet contains this substance, five points may be added. Foods rich in iron are: spinach, beef, beef juice, dandelion greens, and egg yolk.

Energy foods are necessary but should not be eaten to the exclusion of other foods. These include bread, cereals, beans, macaroni, potatoes, peanut butter, bacon, plain cake and cookies, simple puddings, honey, molasses, jam, and jelly. Fatty foods which are particularly good for the growing child are cod liver oil, egg yolk, butter, cream, and whole milk.
—LUCY THOMPSON.

Neighborly Notes

It was a still, hot night in the country. For hours all had been wrapped in darkness and peace. The hands of the clock crept slowly around until they measured off the hour of midnight. Suddenly the quiet in every farm home in the community was shattered by the shrill ringing of the telephone. Long rings, short rings, every sort of ring was given in an effort to awaken the sleeping countryside. As they awoke and hastened to the phone to find the reason for such a disturbance in the nighttime, the cry flew over the wire of "Fire! Fire! Fire! All of Martin Johnson's buildings, except his house, are on fire."

Rushing to their windows as they struggled into a few clothes, the neighbors gazed upon what had been a world of darkness suddenly transformed into a world of red light, centered around a mammoth, raging, red blaze as the flames leaped higher and higher into the air. The roads became alive with people, half dressed, running along, and cars hurrying to the relief of a neighbor. Most of the neighbors within a mile or two were soon there but little could be done. The night was still, with no wind, and as the house stood a little apart from the other buildings it seemed safe. The other buildings, with the exception of a tool shed, were all ablaze, one having caught from the other as tinder. A very meagre amount of machinery had been saved and the horses and cows that were in the pasture when the fire started.

The women stood about, dazed and helpless, watching the buildings as they tottered and fell as the flames roared and soared upward. Children huddled together in a little group, some crying quietly, others shrieking hysterically. The men rushed about with water which they pumped from the cistern, frantically throwing it here and there. It was impossible to reach the well and gasoline engine, for the fire raged all about them.

Unknown to the watchers, a gentle breeze started up. Suddenly a flame broke out on the roof of the house. At first everyone became panic stricken. Then the men left the other buildings and rushed to the scene. A bucket brigade was formed and men took turns pumping water from the cistern. Women rushed into the house and dragged out all that they could lift and saved a good share of the household goods. But soon all of the water was used and the supply was exhausted. All worked valiantly but to no avail. The house could not be saved. The little breeze that had arisen unawares fed the fire and kept it beyond control.

In the morning a sorry group stood hovering about the scene. The charred ruins still smoldered. A variety of half burned articles lay in a heap on the grass. Household goods were piled in a field of ripening oats. Cars kept driving up with curiosity seekers bent on seeing the destruction of the night before. The stock had to be fed and there was nothing to feed it; cows needed to be milked and there was no place to tie them and no pails or cans for the milk; the family needed a place to live and food to eat, and there was neither. Only one building remained standing, a fair sized tool shed with a floor, door, a few windows, four walls, and a roof. This, they decided, must serve as their home through the next few months. Neighbors were back early in the morning with lumber to build out-of-door stanchions for the cows and sacks of oats and barley. The women brought baskets laden with food for the Johnsons and the men who were assisting them. By night the tool shed had been thoroughly cleaned and the Johnsons, with what furniture they would need, had been installed in their new home.

That evening the men of the community met around the ruins of the fire to discuss the problem of ample fire protection; not by insurance, for that was up to each and every individual, but some means by which they could have the use of a fire engine and equipment for just such occasions as this had been. The matter was thoroughly and seriously discussed. They could not expect the nearest city to send forth its truck, for they had been forced to refuse to do this, since a very serious fire had broken out one day when the truck was out in the country. As the truck had been purchased by the city to protect the city, it had been decided that it must be kept within the city limits. The meeting this evening resulted in a committee of three men being elected to study the question of fire protection and see what solution could be offered.

It took these men three months to gather the data that they wanted. Then the community was called together in the new barn of Martin Johnson's which was nearing completion, to hear their report. They had met with the council in the nearby

Mrs. Leonard: Mrs. Harker is t ty-three, but you couldn't tell it.
Mrs. Lennox: Nevertheless, I —Good Hardware.

and the council had offered this position: If the three townships surrounded the city would purchase a small fire engine, the city would provide a place to keep it in, and forth a crew of trained firemen ready to any call in the country, and the expense of the upkeep on the truck, if in return the city might have the use of it, should it ever happen that they needed more than their own truck at a fire.

The fire at Martin Johnson's had received a great deal of attention and publicity. Farmers and town people from miles around had driven to see the ruins in the days following the fire. Everyone was agreed that something must be done to prevent the repetition of this serious affair. No one knew how it started but in the course of a year there are many serious fires of unknown origin in the country Had they been able to secure a fire truck promptly, the house, at least, could have been saved.

The men in this community set about to convince the other two townships of the necessity of owning a fire truck. At the town meetings the following spring these three townships voted to purchase this truck and today they are enjoying ample fire protection, and are resting secure in the knowledge that when they need a fire there are trained workers they can depend it. A distance from this community, a fire truck was purchased and placed in the town by popular subscription among the farmers, and the truck goes only to those farmers who helped to pay for it. In still another city a truck was purchased and owned by the city for rural use. It goes into the country at a certain charge per run. The time has arrived when every rural community realizes that it needs fire protection and is adequate.—ETHEL MORRISON HUDSEN.

What They Talk About

"A friend of mine wrote me some time ago that she was going to organize a club I was certainly surprised that she is not the organizing type but this is what she wrote:

"I've finally got my dander up and have reached the point where I'm going to do something about it. I go to church and there the women talk sick; I go to community meetings, grange, to ladies' aid, and everywhere it is the same; all the women talk shop until I am ready to scream. Now you know my people were particularly well educated but we never read the daily newspaper at home and we talked about what was in it—and it wasn't the murders, either.

"We hardly ever got to hear a fine concert back home but somehow we knew who the great musicians were when we talked about them. Days when I get so tired of the sight of milk cans that I think I can never look another one in the face, I just long for someone to talk to about things that are clear away and out of my life. I'd like to hear what someone else thinks about.

"I adore my husband and children—you know I do—and I love country life but I don't want always to be talking about whether they just won't eat cabbage cooked this way or that and I do like to escape chickens once in a while—and diseases and operations.

"So I am going to organize a club and the club is going to subscribe for one or two magazines that haven't got one word in them about clothes and housekeeping and that wouldn't print a recipe for a million dollars. And we're going to read those magazines and talk about what's in them and anyone who gets in the club and doesn't like it will just have to get out. I'm going to try to have my children interested in things beyond their small horizon, too, and the only way I can see to do it is for me to blaze the trail for them. It won't make them dissatisfied; it will make them all the more contented."

I have changed the letter only enough to conceal the identity of the writer though I doubt if she would care about that. Thousands of farm women have these same longings and her idea seems to me an interesting one and one that it would pay any woman to tackle in her own community if she has the energy and a bit of leisure, for there is nothing that lifts us out of our daily grind like getting a view of people far away and different from ourselves.—LUCY THOMPSON.

What Else Can We Have?

Christmas always finds a goodly number of tired mothers who have got the meat and pie ends of the dinner ready but who have been too utterly busy to give much thought to the in-betweens, taking a chance on having an inspiration at the last minute.

Now onions for Christmas dinner may not seem very exciting but onions, French style! That's a different matter. And you'd be surprised how many well regulated Christmas dinners include a dish of this common vegetable—smelly but so good.

To make the French style onions, divide about a dozen of them into quarters, put into a sauce pan with a quarter cup of butter, cover very tightly and cook till tender, stirring occasionally and seasoning at the last with salt and pepper.

You'll nearly all have apples in the house and they make another fine last-minute dish. Pare and core as many as you require, put into a pan and add boiling water to nearly the top of the apples. Cover and cook, not too fast, until the apples begin to look clear. Add sugar and a little grated lemon rind if you have it and cook until the apples are completely clear. If you have any red cinnamon drops, dissolve a few of them in water and add to the apples while cooking to make them red and Christmassy.—LUCY THOMPSON.

Mothers and Daughters

About a year ago one of our women's magazines of large national circulation offered a first prize of $100 for the best letter from a girl on, "Why I Do Not Confide in My Mother." The letters published as a result of this contest were extremely interesting and, in spite of the pessimistic tone, they must have been exceedingly helpful to mothers of girls in the process of "growing up."

The prize-winning letter stated that most girls do not confide in their mothers because the mothers do not invite the confidence; that up to 12, say, mothers are responsive to the problems of their children but after the maturing process has begun, when a girl's ideas seem queer and hazy, the mother loses patience with her and confidences are shut off, never to be naturally resumed. The mother becomes frightened about possible happenings and comradely talk changes to ominous warnings and admonitions.

The magazine conducting the contest listed its findings under the following heads: 517 mothers deliberately lied when questioned about sex and the source of life; as many more evaded the question; 351 betrayed confidence; 335 were too old fashioned; 227 were too busy to listen to their children; 196 were not interested in their daughters' confidences; 172 were too critical; 161 did not trust their daughters; 143 forgot that they had ever been anything but perfect and were too easily shocked; 139 laughed at childish confidences; 133 insisted on managing their children's affairs at any age; 118 did not solve their children's religious problems satisfactorily; 114 never invited confidences and gave none; 93 were not affectionate; 71 nagged; 65 were unfair; 54 were dictatorial.

If you have a mothers' club in your community it would be interesting to take this list along to one of the meetings and discuss it frankly for if there is as much wrong with our young folks as the world at large seems to think there is, the regaining of children's confidences on the part of mothers would go a long way toward setting things right.—LUCY THOMPSON.

Good Ventilation

"We are beginning to realize that the carbon dioxide content of the air is not nearly so important to the health of human beings as the temperature of the air, its circulation, and moisture content."

This remark is a comment by the Wisconsin State Board of Health of the findings of the New York State Commission on ventilation and is particularly timely at a season when houses and other buildings are closed to keep out the cold and when many persons are shut up in rooms as they are all through the school year.

It was once thought to be very dangerous for one person to breathe into his lungs air that another had breathed out and we still consider it very distasteful and to a certain extent dangerous but we know now that there are other problems to be considered in connection with ventilating.

Many persons feel that everything

is all right so long as they are warm enough but it is a safe guess that many more people have been injured by being too warm than ever were hurt by being too cold, though the latter is more uncomfortable.

The New York Commission referred to above studied the cases of 2,500 school children distributed through 58 class rooms in eight different school buildings and 3,000 other children distributed among 76 rooms in 12 different schools. The health of the children was watched carefully for eight weeks during the first season and for 12 weeks during the second season. Each room studied was ventilated in one of three ways: (a) by a low flow of cold air, (b) by a low flow of cool air, (c) by a high flow of warm air.

When records for the two seasons were analyzed they showed that the amount of respiratory illness in rooms of the (a) and (b) type was about the same, while type (c) rooms showed an eight per cent excess of absence of pupils due to respiratory diseases and a 70 per cent of excess illness due to the same cause among pupils in attendance.

Rooms of the (a) and (b) type were kept at mean temperatures of 59° F. and 66.5° F. respectively, while rooms of the (c) type were kept at a mean temperature of 68.5° F.—LUCY THOMPSON.

Apples With Pork

I think the practice of many people of never having pork without apples is a good one. Pork fat seems, somehow, greasier and heavier than other fat and it is acknowledged, I believe, to be harder to digest. Apples take away to a large degree the heaviness that so many people object to in pork, especially when it is fresh, though I do not know that they make it any more digestible.

If your pork is roasted you can make a pretty effect by surrounding it on a platter with baked apples or apple rings. To make the latter, cut clear across the apple slices from one-fourth to one-half inch thick and cook them gently in a clear syrup or in one to which you have added a few red cinnamon drops. These give the apples a nice rosy look and make them taste better, too.—LUCY THOMPSON.

Butchering Recipes

If you buy your table salt in five-pound cheese cloth bags you will find them very convenient to use for packing sausage at butchering time. Sausage put up this way should be kept very cold—freezing won't hurt it—and when it is to be used slice it, bag and all, with a very sharp knife and peel off the cloth before frying. Sausage may also be packed into large stone jars, covered with a layer of melted lard, and kept in a cold place or it may be fried in cakes and packed away in jars which are sealed by pouring on hot lard.

The following recipes which I think you will like come from the University of Wisconsin:

For head cheese, boil 25 lbs. of pork taken from the head, heart, tongue, and trimmings. When the meat separates from the bones cool the mixture and take out the bones. Chop the meat into small pieces, or grind it and add these seasonings: ¼ lb. pepper, ½ lb. salt, ¼ ounce allspice, ¼ ounce cloves, ½ ounce caraway, 2 quarts broth in which the meat was boiled. Mix thoroughly and cook twenty minutes. The cheese may be put into a clean hog paunch or into a two-inch pan to cool.

To make old fashioned scrapple, prepare the meat the same as for head cheese—25 lbs. of it—and add ¼ lb. pepper and ½ lb. salt. After all the bones have been removed return the meat to the liquid in which it was cooked. Heat to the boiling point and add corn meal slowly, stirring constantly, until the mixture becomes thick like corn meal mush. Stir well and boil for 15 minutes. Cook slowly on back of range for an hour longer. Put away in shallow pans.—LUCY THOMPSON.

White Fruit Cake

There are many people who do not care for the regular type of fruit cake but practically none who do not like the white kind. This recipe was given me by a friend and I liked it so well that I am passing it on as one that is easy to make, delicious, and not prohibitively expensive, though all fruit cakes are more expensive than most of us can afford often.

½ cup butter
1⅓ cups sugar
½ teaspoon vanilla
½ teaspoon orange or almond extract
1 cup water
3 cups pastry flour
½ teaspoon salt
4 teaspoons baking powder
½ cup chopped candied cherries
¼ cup chopped candied pineapple
2 tablespoons chopped candied orange peel
Whites of five eggs

Cream shortening, add sugar slowly, and beat till light. Add flavoring and a little of the water, then part of the flour sifted with the salt and baking powder, then the remainder of the water and the remaining dry ingredients, then the fruit which has been slightly floured. Fold in beaten whites of eggs and bake in a round loaf in a moderate oven about fifty minutes. The usual icing for this type cake is the white boiled frosting.—LUCY THOMPSON.

Too Tired to Eat

"I'm tired, I don't feel like eating."

"There is a particular significance to this feeling of grown-ups, when we stop to realize that this may apply to children as well as adults," advises Miss Ada Lockhart, nutrition director of the National Dairy Council's Ohio unit. "Pediatritians—those doctors who specialize in child care—have a favorite saying, 'A tired child won't eat.' Yet many times children are hurried to the table, direct from play or study, and obliged to compose themselves in the right mood or adjust themselves to the form necessary, with hardly a minute's preparation. Little nerves may be all taut from an exciting game or equally distracting disagreement. Little minds may be troubled or tired from study or music lessons."

Miss Lockhart points to the well-known fact that children do not know when they are overtired. Their se of judgment, their training in s control has not yet taught them stop. A call to supper a half h before actual meal time, with an portunity to "wash up" in ord fashion, and the requirement for teen or twenty minutes absol quiet and relaxation, prepares body for taking care of the f which is so important a factor in growth and health of boys and g

The next time Johnny or M complains that "I can't drink all t milk," or that "I don't want any s ach," mother or dad should stop consider the real reason may be t they came to the table tired out that the poor appetite could be me ed and improved in a large meas by the simple short rest period fore the meal, concludes Miss L hart.

Lucinda Matlock

The Chinese are a resposeful p ple and their calm is always a buke to our feverish western ha Have you heard the story of the v ing Chinese statesman who was b taken around New York? His h were hurrying, hurrying, getting rapidly about from one place to other; never stopping to enjoy a thing when they got to it but rush on to the next place. Finally one them said to the statesmen tri phantly, "We saved a whole min there by catching the subway," the Chinaman replied, "But what you do with it, now that you h saved it?"

Lack of repose is everywhere; p ple are hurrying more frantically the time and the ability to enjoy quietly seems to be passing per nently away from us. Some o when I see the high pressure at w life is going on I think with joy simple Lucinda Matlock. If you h read Spoon River Anthology you remember that she is one of the m characters who, speaking from t graves in Spoon River cemetery, how they happened to lie there. cinda's is, I think, the finest stor the book. Here is part of it:

"I spun, I wove, I kept the house, I n
the sick,
I made the garden, and for holiday
Rambled over the fields where sang the
And by Spoon River gathering many a
And many a flower and medicinal weed
Shouting to the wooded hills, singing t
green valley.
At ninety-six I had lived enough, that i
And passed to a sweet repose.
What is this I hear of sorrow and weari
Anger, discontent, and drooping hopes,
Degenerate sons and daughters?
Life is too strong for you—
It takes life to love life."

—LUCY THOMPSO

Shoe Bags—Nos. 3 to 3183, Inclusi

Here is an accessory the well ordered bc that will be very g appreciated. These bag readily attached to the door and keep the sho proper place at all t They come in three size you will note by the illu tions shown. Prices a follows: Bag with pockets, 65 cents; bag eight pockets, 85 cents with 12 pockets, These are made of quality, heavy unbleached muslin. Pockets are of f color material in the f ing colors: Red, blue, and maize. They ar made and bound cor with metal grommets i for attaching to the Be sure to specify colo size desired when order

Cleaner Stockmen

)ARD'S DAIRYMAN:—There has a lot written about bigger and r county fairs, and about cleaner ty fairs. But I want to urge ier stockmen at our fairs.

helped show cattle at several of county and state fairs this fall. of the fairs furnished excellent ters for the stock and "wash-s" for the cattle, but made little o provision for sleeping quarters "wash-racks" for the men who care of those same cattle. If e was an empty stall, well and ; if not they could sleep in the behind the cows. At no county did we find a ghost of any provi- for the men to bathe, and one e superintendent assured us that re attempted to use the cattle sh-rack" (except after midnight) washing stockmen they would us in."

ne state fair, whose governor had picture posted up all over the fair nds proclaiming him the "patron :" of the state fair, had two vers tucked away in one corner of of the cattle barns. One of the vers was out of order and no pro-n was made for heating either of n.

nother state fair had a little len building with four showers, a r, and a man to keep water hot. t was surely appreciated. Still her state fair had a very nice nitory for cattle men and one ver but they disconnected the er in the shower during fair week, eby saving the state several dol-

ersonally we do not mind sleeping n empty cow stall or even in the behind cows, but we do object to g five or six weeks without proper ities for taking a bath. A small ling, not necessarily having a ing plant but with one or two vers, can be put up very cheaply no county fair should be without

any of our showmen are young who have formed habits of clean-s at home and they should not be cted to go out and work hard, ing, keeping clean, and showing a g of cattle for from 5 to 9 weeks not have the facilities for keeping n themselves.

ou hear a lot of "holler" about ex-ing questionable shows and hav-a clean county fair, but I say let's a positive step and have clean men or at least give them a ice to be clean.

isconsin. ROBT. HARGRAVE.

Children and Work

OARD'S DAIRYMAN:—Many well ning people believe children ld be kept from work in order to ue an education. Many consider a misfortune, a penalty of pov-

believe work is education and that king habits must be formed in y years if they are to be formed ll.

know a girl, the daughter of fair-ell to do parents, that as a child always eager to work, wanted to her hands which is a normal thing children. Nobody took any pains her, thinking it a disgrace to k. She did not have to earn her g and consequently that instinct ected, died down. Today she is interested in anything, she is simply a good for nothing girl. If she had been trained to work she would have made a wonderful woman and a useful citizen.

What a pity a life should be wasted in this way! I think work is good for children and those who are kept busy will thank their parents in later years. All of our great men had to work while they were young and it is just this thing that made them great.

The work of the world has to be done and each child should have his share. It's a natural, normal thing for a child to want to work. He wants to do things and make things. They should be taught to work, otherwise they are likely not to acquire the habit at all.

Experience has taught me that work for children is not slavery; on the contrary, it gives them confidence and will help make them better men and women.

Illinois. (MRS) FRANCIS J. ORR.

Commendation

HOARD'S DAIRYMAN:—I wish to thank you at this time for the many good points on breeding, feeding, and all other good points I have learned from Hoard's Dairyman on dairy farming in the last ten years. I don't think any man that is in the farming game can afford to be without it. I started five 2-year-olds in the C. T. A. last year and the lowest finished with 368 lbs. butterfat with the herd averaging close to 400 lbs. and must give your journal credit for many of the good points in building up this herd.

Wisconsin. W. C. TAYLOR.

An Appreciation

HOARD'S DAIRYMAN:—I have just read in your October 25 issue the splendid reply you made to the inquiry signed "W. P. R.," Milford, Mass., regarding abortion cures and control.

I want to express my appreciation of this article and also of the stand you take on refusing to accept advertisements for so-called abortion cures. Your article is one of the most sensible I have seen anywhere and I think it is high time that more of our dairy papers gave the farmers the true facts about this trouble.

Michigan. W. H.

The Sign That Worked

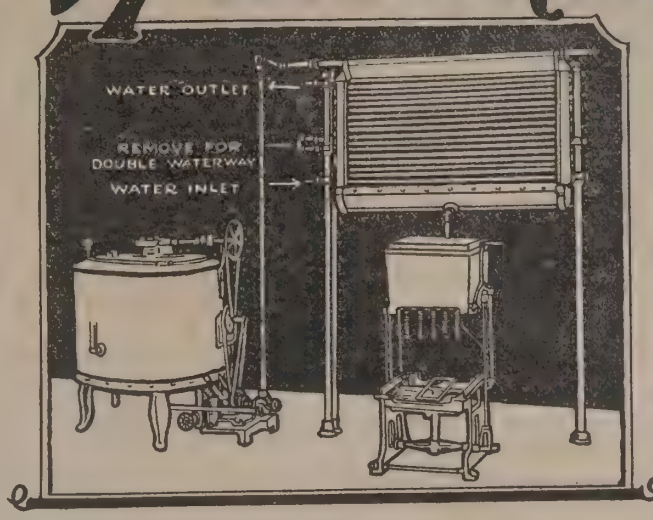
He was a burglar.

After effecting an entrance into the bank he found his way, easily enough, to the strong room. When the light of the lantern fell on the door he saw this sign written in rather conspicuous red letters:

"Save your dynamite. This safe is not locked. Turn the knob and it will open."

For a moment he ruminated.

"Anyhow," he reflected, "there's no harm in trying it if it really is unlocked."



He grasped the knob and turned it.

Instantly the office was flooded with light, an alarm bell rang loudly, an electric shock rendered him helpless, while a panel in the wall opened and out rushed a bulldog which seized him firmly.

An hour later, when the cell door closed on him, he sighed:

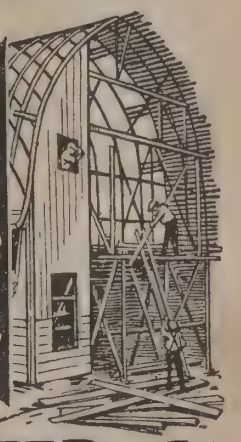
"I know what's wrong with me. I'm too trusting. I have too much faith in human nature."—Everybody's Magazine.

VICTOR DAIRY PASTEURIZER

for the FARM DAIRY and SMALLER PLANTS

REALIZING the need for a simple, efficient and economical milk pasteurizing outfit for smaller plants and farm dairies, *CP* offers the Victor, illustrated above.

The outfit consists of a combined heater and holder, sanitary pump and Alaska cooler. (Bottle filler is not included, but can be supplied at extra cost.) Operation is simple and conforms with all state health boards' requirements.



With a Victor Outfit the small dairyman can produce good, wholesome pasteurized milk just as cheaply and efficiently as the big city dealer. Pasteurization provides safe milk and will increase your business. The Victor is a business builder. Write for full information and prices.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

A Club Boy and a "Runt" Pig

NOBODY wanted that runt pig. Nine boys and nine pure-bred Duroc-Jersey sow pigs were about to form a pig club. Eight of the pigs weighed 50 lbs. each but one —the runt—only tipped the scales at 35 lbs. The pigs were numbered, and the numbers placed in a hat for a drawing. But there was the runt. Nobody wanted her. The boys refused to draw while she was in the lot.

Oh, yes, there was one boy braver than the rest. He had visions. He wanted to raise a prize winner just as much as the other fellows did. Perhaps he was sorry for the runt. Perhaps she winked at him.

Lee Griffitts wanted to be a pig club member. If nobody took the runt there might not be a pig club. So Lee Griffitts stepped up to County Agent Baker and volunteered to buy the runt. County Agent Baker at first refused, but Lee insisted and was finally granted his request. The other boys then drew numbers for the eight, and all paid $15 apiece for their new pets.

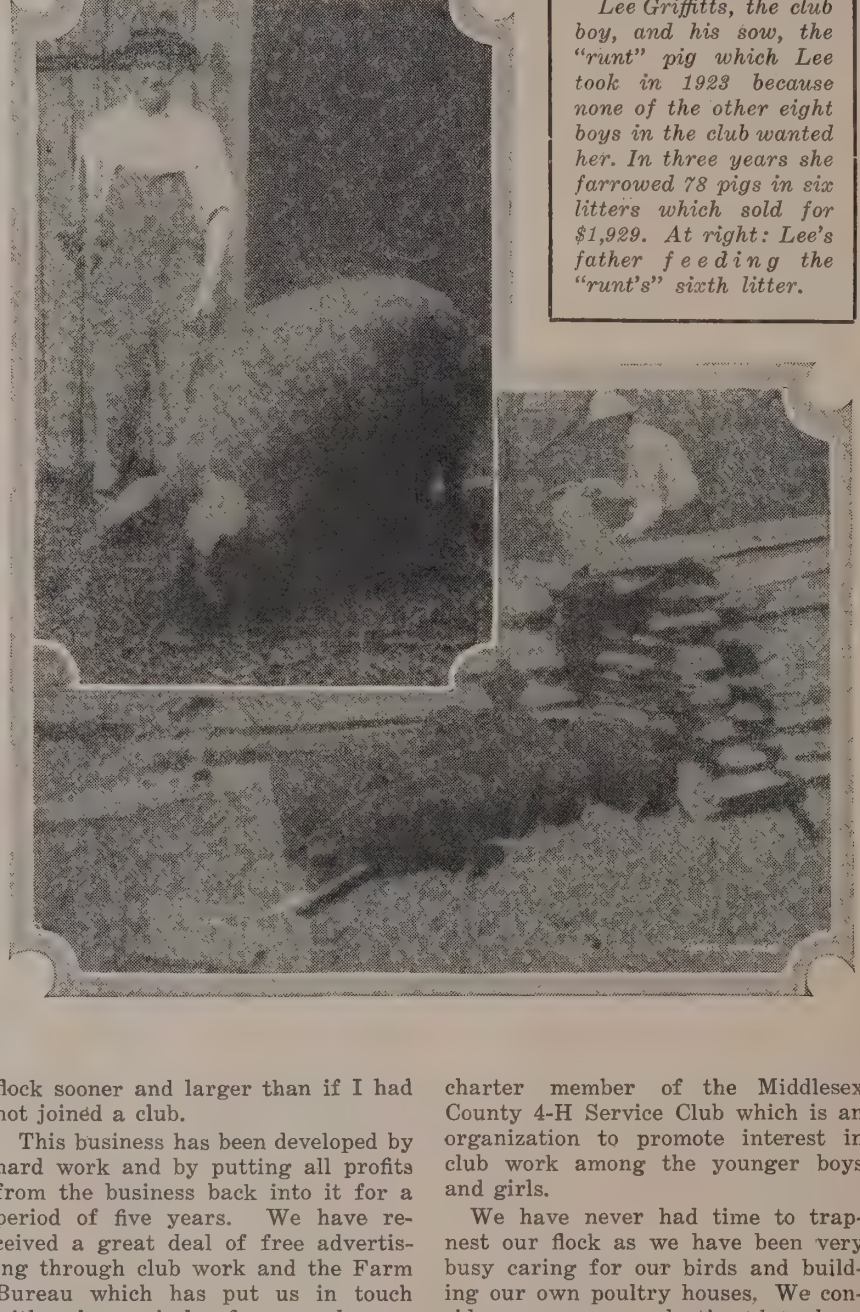
That was back in March, 1923. Lee took the runt home. He gave her special care. He had challenged the other boys at the drawing and he intended to make good. He did. It was the runt that won first prize in the fall when the nine pigs and boys met in competition.

"A balanced ration—corn, tankage, and skimmilk, regular feeding and good care turned the trick," Lee told the boys when his pig was declared champion.

In the three years that followed, the "runt" farrowed 78 pigs in six litters which sold for $1,929. Add to this the value of the sow and you have a total of $2,004. Not bad for a "runt" pig and a club boy in three years, is it?

The sow and the boy both must have had considerable to be thankful for because when Thanksgiving Day rolled around each year another litter of pigs was born. On three successive Thanksgivings the "runt" farrowed litters. It must have been her way of giving thanks to her owner for befriending and taking such good care of her.

The sow produced three large litters in 13 months as follows: Her first litter contained nine pigs Thanksgiving, 1924, she farrow pigs; on May 1, 1925, she farrow pigs. The fourth litter was bo Thanksgiving, 1925, and contain pigs. Every one of the 46 pigs rowed in the first four litters raised. The fifth and sixth litters tained 16 pigs each, and 13 a pigs were raised respectively.



The feed given the fifth litter how Lee Griffitts grew out his for market. The 13 pigs cons $27 worth of shorts, 1,000 gallo skimmilk valued at $20, 130 b of corn valued at $65, and we lowed the run of a rape and oa ture valued at $8, making a tota cost of $120. The pigs were s six months of age for $520, leav profit of $400 above feed cost.

On the six litters from his run Griffitts realized a net profit of or a net return of $312 a year. that for a runt?

Fred Griffitts, Lee's father, leading dairyman of Loudon Co Tennessee. Before Lee joined pig club, no hogs had been ke the Griffitts' farm. Today Mr. fitts says he would not be witho least one good sow. "Cows and go together" is the way he state matter.

He milks 15 cows which ma net profit of $830 last year in tion to furnishing skimmilk fo hogs. Milk and corn with some age and shorts are a wonderful bination for producing cheap ga hog feeding, according to Griffi

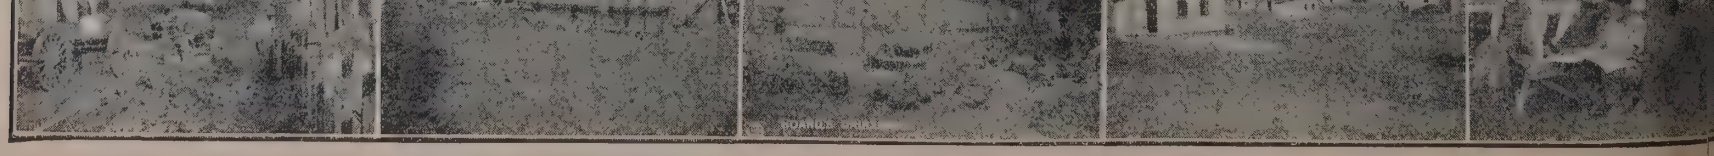
Besides hogs and a dairy herd Griffitts grows corn, wheat, h small acreage of tobacco, a good den, and keeps bees and chicke his 335-acre hill farm, 150 of wh in timber. When Lee is away at s and he has been away teaching father takes care of the "gold sow and her piggies, the runt made good.

Lee Griffitts, the club boy, and his sow, the "runt" pig which Lee took in 1923 because none of the other eight boys in the club wanted her. In three years she farrowed 78 pigs in six litters which sold for $1,929. At right: Lee's father feeding the "runt's" sixth litter.

Gastler Brothers Build a Big Poultry Business From Club Work

HOARD'S DAIRYMAN JUNIORS: —I started in with club work in 1918 when it was first organized in Middlesex County, Connecticut. While I always liked the farm, these clubs were organized with the slogan, "Help win the war." After once belonging to a club it was just natural that I should stay in club work.

In 1921 a poultry club was organized in Durham and it was from this time on that we started increasing our poultry flock on our farm. While I was always interested in poultry and had a small flock before joining the club it is probable that it changed my ideas and that we increased our flock sooner and larger than if I had not joined a club.



This business has been developed by hard work and by putting all profits from the business back into it for a period of five years. We have received a great deal of free advertising through club work and the Farm Bureau which has put us in touch with a large circle of men and women who are prospective customers or who will refer us to such, which could not have been reached as satisfactorily in any other way. We originally planned on a commercial egg farm but we have had to change our plans to meet the demand for baby chicks.

I have been in club work since 1918 which would make 10 years. I was 21 years old last March, and I am now no longer in club work, but I am a charter member of the Middlesex County 4-H Service Club which is an organization to promote interest in club work among the younger boys and girls.

We have never had time to trapnest our flock as we have been very busy caring for our birds and building our own poultry houses. We consider our egg production has been very good as we have averaged as high as 156 eggs per bird on a flock of 980 birds.

We market our eggs in a nearby city mostly at wholesale although we have a small retail trade. These eggs are all candled. Our broilers, roasters, and fowl are sold to a wholesaler who gets them right at the farm. This wholesaler sells to the summer resorts and shore trade and for this reason and because our stock i Barred Plymouth Rocks, he pays premium for them.

We feed our flock as recomm by the Connecticut Agricultura periment Station at Storrs. Ou tire flock is handled as a bre proposition and not as a comm farm. The birds have mash t them at all times and in the la ternoon they are given a heavy fe of scratch grain which is enou that they will have all they wa eat before they go to roost, a that some will be left in the litt their early morning feed. We our birds germinated oats, and liver oil mixed in the oats, and t fed in the morning. During the ter the birds have all the ca they can eat and in summer

Minnesota Champion

With his grade Jersey yearling,
e, doing her part by winning the
ors of her class at the Minnesota
te Fair and Northwest Dairy Ex-
ition, Harold Larson, 16-year-old
boy of Redwood County, has been
lared grand champion dairy calf
member in Minnesota. This con-
is based on the record of the boy
girl as a dairy calf club member,
record made at the state fair, and
oral examination.
I selected a Jersey for that is my
orite breed of cattle," says Har-
. "I named her Babe and kept her
pasture the first month and a half.

HAROLD LARSON AND BABE

In the evening I turned her into the barn and gave her two pounds of a mixture of equal parts of ground oats and cracked corn together with a handful of oil meal. She had free access to alfalfa until morning when she again received her grain and was turned out to pasture.

"For the last 45 days I kept her in the barn and increased the grain to five pounds a day. In the evenings I exercised and trained her, and she surely enjoyed it after a hot day in the barn. After washing and polishing her for the show ring I felt well repaid for my efforts."

Our Review Column

[A regular feature of the junior department, reviewing the contents of Hoard's Dairyman for the previous issue. Let's talk it over.]

For further discussion of the following, see the November 25 issue of Hoard's Dairyman.

Why should milk be a part of the food eaten by young and old? Because it is the one food that makes the diet fool proof, according to Dr. G. K. Abbott of the Washington Sanitarium and Hospital, the largest institution of its kind in the South Atlantic States. "Milk containing lime, plus the essential vitamins, can sustain life indefinitely." (See page 1091.)

What is the production record of the Kansas state herds? Five hundred ninety-one cows averaged 9,837 lbs. milk, 333 lbs. fat last year. Since 1918, the number of cattle in the 12 state herds has increased 77 per cent and the total milk yield has jumped 173 per cent. (See page 1092.)

How many cows have been culled as unprofitable? Since 1922, when testing was begun in the Kansas state herds, 310 cows have been culled as unprofitable.

How many types of electric motors are recommended for the average dairy farm? Three—1, individual, such as a motor for the milking machine or the separator; 2, a small utility motor can often do a half dozen seasonable jobs, such as turning the churn, the grindstone, the sausage grinder, and the fanning mill; 3, the large utility motor, probably 5 H-P, will run the feed grinder, the concrete mixer, and the wood saw. (See page 1094.)

What is a profitable market weight for pigs? There is more net profit in marketing hogs at the weights between 175 and 210 lbs. than at heavier weights. (See page 1106.)

How should salt be fed to the poultry? It should be mixed in the mash, using fine salt at the rate of 1 per cent, or 1 lb. per 100 lbs. mash mixture. (See page 1120.)

Should coarse oyster shell be a part of the poultry ration? Yes, just as much a part of the ration as a grain mash or other ingredients. An average hen will consume about 3½ lbs. oyster shell per year.

Why is cod liver oil fed to laying hens? Usually it is fed as a preventive for paralysis, poor shell texture, low production, and egg eating. The usual recommendation is 2 per cent added to the dry mash. It may also be fed as one pint per 100 hens weekly in milk, moist mash, or scratch feed.

Junior Letters

Earning an Education

Hoard's Dairyman Juniors:—I graduated from the eighth grade last year and have my diploma and this fall I am going to high school. I picked strawberries to get enough money to take me through a year of school and when I got through with strawberries I helped at home with whatever I could. My address is R. 1, Bush Prairie, Wash. Alice Jenny.

My Cow

Hoard's Dairyman Juniors:—Father gave me a grade Jersey calf to raise. I named her Cherry. When she became a cow she gave over four gallons of milk a day. I sold her when we sold out at the auction sale, as a second calf heifer. She brought me $87. I paid father for the feed and bought some good clothes with the rest. In case other Juniors want to write to me my address is Escalon, Calif.

Carl Trink.

A New New Zealand Junior

Hoard's Dairyman Juniors:—I am a 14-year-old boy working for my dad. We have about 85 pedigree Jersey cattle now and hope to breed more. We have about 16 young bulls to break in to take to the bull sale.

We have about 180 acres of land altogether and all has been broken in. It is mostly hills and hollows which shelter the cattle when there is a gale on. It is also sheltered with trees; most of the paddocks are watered by creeks or troughs.

We have six cows under C. O. R. test. Most of them have done what they are supposed to do, and some are doing more. We have one heifer which is not quite a 2-year-old and for the first month of her testing she produced 43.58 lbs. butterfat and 913.8 lbs. milk. All the cows that are under C. O. R. test get a little bran and moose nuts to make them produce more milk.

New Zealand farming is quite different than American farming because we do not have to house the cattle in the winter. Instead of housing the cattle in winter we feed them hay and turnips. We feed a few carrots and mangolds if they need them. We send our cream to the largest butter factory (the New Zealand Co-operative) in the world.

I have to thank the club for the watch fob, badge, and creed of which I am very proud.

If any of the Juniors wish to write to me my address is "Tyntesfield," Okauia, Mata Mata, North Island, N. Z.

Ronald R. W. Garland.

YOUR business is primarily the production of butter-fat.

Our business with you is primarily the purchase of butter-fat to market in various forms throughout the world.

But you must not forget that we offer you a cash market at all seasons of the year for the products of your farm.

On every farm reached by this paper there is, for instance, an average of 25 hogs. Besides hogs, calves form a highly important product. We are also continually in the market for chickens and eggs. In addition to all these prime products, we provide you with a market for cows and bulls, that may be used in the preparation of meat foods.

We meet you on a fair competitive basis, giving you the best price we can afford on an open market. We need your products; and you need our services. It is therefore to our interests to encourage you, by fair dealing, to sell to us; and it is equally to your interests to avail yourself of the marvelous manufacturing and marketing organization we have built up throughout this country and in foreign nations in the course of 60 years' successful business.

DAIRY MARKET NEWS

November Condensed Milk

(From Report by U. S. Dept. of Agriculture)

During November, according to reports from 116 factories manufacturing both case and bulk condensed and evaporated milk in various sections of the United States, producers received from $1.88 to $3.10 per hundred for 3.5 per cent milk f. o. b. factory, the average price being $2.20. Reports from an additional 23 factories manufacturing bulk goods only show an average of $2.39 per hundred, the range being from $1.94 to $3.10.

Manufacturers' wholesale selling prices for sweetened condensed and unsweetened evaporated milk were as follows for October:

	Range	Ave.
Condensed, per case	$5.60— 6.75	$ 6.28
Condensed, per cwt.	9.25—13.00	10.38
Evaporated, per case	3.63— 5.20	4.51
Evaporated, per cwt.	7.23—10.50	8.83
Condensed skim, per cwt.	5.19— 7.25	5.93
Evaporated skim, per cwt.	2.50— 4.50	3.53

Cold Storage Holdings

(U. S. Department of Agriculture)

The following is a report of the cold storage holdings of dairy products on November 1, figures being given in thousands of pounds (000 omitted):

	Nov. 1 5-yr.-ave.	Nov. 1 1926	Nov. 1 1927
	Lbs.	Lbs.	Lbs.
Butter, Creamery	96,227	100,871	118,768
Cheese, American	62,218	72,491	58,867
Cheese, Swiss	7,861	7,903	7,633
Cheese, Brick	1,728	1,381	1,761
Cheese, Limburger	1,264	1,544	2,054
Cheese, All Other	6,291	6,466	7,115

These holdings include stocks in both cold storage warehouses and packing house plants.

Connecticut November Milk

The Connecticut Milk Producers' Association announces the following prices for Grade B milk delivered during November at market milk centers:

All milk sold in fluid form, 9.5 cents per quart for 4 per cent milk, and 4 cents per point allowed for other tests; all milk made into cream that is sold in fluid form, 22.5 cents per pound fat above the average monthly price of 92-score butter on the Boston market; all milk made into butter, at a price per pound fat equal to the month's average on 92-score butter in Boston.

Iowa September Butter

The Iowa Creamery Secretaries' and Managers' Association reports that for the local creameries reporting, patrons received 51.08 cents a pound for fat in September as compared with 49.46 cents for the same month a year ago. The price paid per pound of fat ranged from 45 cents to 55 cents, with the average fat handled per creamery being 25,302 pounds.

Butter and Cheese in November

Butter averaged 49.7 cents on the New York market for the first twenty-six days of November, which is 1.3 cents above the previous month and one cent below the November average of the previous two years. Prices advanced steadily during the month and the market appeared to absorb the fresh butter at advancing prices despite the use of storage butter by many dealers. There is disagreement as to what the trend of the market will be in the immediate future. The lighter production and the tariff wall tend to support the strong outlook. The opposition calls attention to the slower movement out of storage and it is of the opinion consum of butter is not as favorable as a year

For the first time this year the market registered a serious decline, and tended to discourage imports. The de however, has been largely made up an average on the Wisconsin boards wil proximate 25.7c for the month. This is cline of one cent from the previous but is still approximately two cents November of the two previous years.

Twin City October Mil

The Twin City Milk Producers' As tion of Minnesota paid $2.60 a hundre 3.5% milk delivered in St. Paul during ber. The association handled 20,281,65 milk, of which 37% was surplus.

Cream patrons were paid 56 cents a for butterfat in first grade cream durin tober. This is 7.6 cents above the av price of 92-score butter on the New market.

The Feed Market Situat

(By the Grain, Hay and Feed Market Service Bureau of Agricultural Econ U. S. Department of Agriculture.)

The supply of feed grains and feeds thi son is much the same as a year ago there is much more hay on hand. Except ly fine weather in October favored the crop and the supply of corn, includin crop and carryover, is placed at about 000,000 bushels more than a year ago.

Cottonseed meal continues to advance quotations are now over 10 per cent h than at the low levels of a year ago. sumers seemed disposed to buy for imm needs only at current quotations but cr were holding their offerings firmly and s unwilling to quote liberally for deferred ment.

Stocks of cottonseed meal of about 1 tons on November 1 were the largest o date in recent years. The carryover int season was considerably smaller than a ago but about 45,000 tons more were cr in the first three months of the season out shipments totaled about 46,000 tons Crushers had about 100,000 tons less c seed on hand on November 1 than a yea

Linseed meal prices also advanced i face of liberal production of this feed. C ings continued to be of good volume be of a good demand for linseed oil at the prices for several years but the offerin linseed meal seemed to be taken readily. mills and resellers were offering free Buffalo although at firm prices. Howeve casional large lots were sold at concessio order to provide needed shipping instru from time to time. Prices showed a f advance at Chicago where the demand fo moderate offerings was only fair. Buyi jobbers and feed mixers helped to ad prices at Minneapolis where country d were not buying ahead.

Gluten feed continued to move readily consuming channels and dealers at Ch were also quoting this feed for January ment at a 50c premium over December p although December feed was still availa that market. Both independent mills an sellers were offering this feed freely at l lo although the Corn Products Company quoting only for December shipment at point at prices 50c above November quota

Alfalfa meal averaged nearly a dollar h for the better grades. Best inquiry con to be for top qualities of this feed which tinues to be scarce because of unusual in the principal producing sections last mer. Trade reports indicate that more o feed is being fed in Colorado than last and that Colorado mills are enjoying s trade to the East and South. Demand a cago and Omaha was only of fair volum Kansas City mills complained that w grinders were able to under quote the cause of favorable freight rates.

Tankage continued to move freely into suming channels at unchanged quotatio

November butter averaged 49.7 cents in New York as compared with 50.6 cents i 1926 and 50.7 cents in 1925.

Make 1928 your Best Dairy year

Time, now, for putting your best thought to increasing milk profits in the new year. "Turn over a new leaf," without endangering milk production. Put your herd on the proper Quaker Dairy Ration and reduce your production costs to a minimum. Follow the common-sense advice that says:

"Pick the Feed that Fits Your Farm, Your Herd"

Quaker Boss Dairy Ration is the ideal **24%** grain ration for cows receiving timothy hay, grass hays, straws, corn stover, or poorer grades of clover.

Quaker Big Q Dairy Ration exactly **20%** meets the need of those herds receiving poor alfalfa hay, fair clover hay, or real choice mixed clover and grass hay.

Quaker Dairy Ration has no superior **16%** when cows are receiving choice clover hay, good alfalfa hay, or an excellent grade of fine mixed grass-and-clover hay; a good ration for dry stock and for young growing stock.

Quaker Sugared Schümacher Feed, as the exclusive grain ration, has a real place when the herd is receiving liberal quantities of the very best grade of alfalfa hay. For blending it combines beautifully with any Quaker high protein feed. For all stock—dry stock, horses, sheep, swine and steers—it is unexcelled.

All Quaker Feeds contain molasses in dried form and are rich in the minerals cows must have to make milk.

Send for the FREE book—"The Dairy Herd"—it tells you just how to meet the feed requirements of your farm, your herd.

Pacific International Live Stock Exposition

(Continued from page 1134)

make perhaps the best Jersey show ever seen at the Pacific International, brought the dairy division to a high standard of excellence. Throughout the barns high quality extended more p'aces down into the judging than has been the case at Portland before. Particularly was this true of the Jerseys and Holsteins. While the Jerseys were remarkable because of the great improvement over last year when the exhibits of this Island type were not much above mediocrity, the show yet must be considered a Holstein show. Competent judgment called it the best Holstein show of the year in the United States. Always a good Holstein show during the past two or three years, it has reached a high standard.

NORTHWEST CHAMPION STOCK JUDGING TEAM, BOYS' AND GIRLS' CLUBS

Left to right: Howard Loe, high scoring individual, winner of Plummer scholarship, Chester Loe, Kenneth Dahl.

Guernseys were in fair numbers and better quality than heretofore, due to the presence of two eastern herds. There is a question, however, if the presence of two eastern herds of high quality in this breed was helpful to the show. Guernseys are comparatively new on the Pacific Coast and there are not yet large numbers of cattle of the best show type. Progress is being made in approaching type ideals and the herds are growing larger, but the presence of two or three of the best herds in the United States dampens the enthusiasm of the local breeder and prevents his exhibiting. It would probably build this department of the show faster to limit eastern entries, and thereby encourage growth and development of the new Guernsey breeders of the West.

The Matador Segis Walker trophy, offered by the Carnation Stock Farms, for the best breeders' young herd of registered Holstein cattle, was captured by the Forum Holstein Farm, Iowa. The same farm was awarded the John L. Smith trophy for the best Holstein produce of dam bred by the exhibitor.

The Holstein silver tea set trophy, presented by I. E. Staples for the best Holstein calf herd, was awarded to the Carnation Milk Farms, Washington. The Jersey silver tea set trophy for the best Jersey calf herd was taken by the La Lomita Rancho, F. R. Bain, California. The Guernsey silver tea set trophy for the best herd of Guernsey calves was given to the William Larsen Canning Company, Wisconsin. E. W. Van Tassell, Washington, took the Ayrshire silver tea set trophy for the best herd of Ayrshire calves. The Brown Swiss silver tea set trophy for the best herd of Brown Swiss calves went to Peringer & Salzman, Washington.

The Holstein Sale

Only one dairy cattle sale was held this year. Forty-six head of Holst were auctioned for an averag $200. The offerings had few rec and could have been improved s what in fitting to advantage. high bull sold for $280 and the cow for $325.

The Holsteins

Judge: Axel Hansen, Minnesot

The Holstein line-up was sai competent observers to be the quality in the United States year. Certainly it has not been celled at Portland during the se years in which the Portland show been markedly a stein show.

The best class o show was the aged class in which N sack Irma Segis, grand old cow of Carnation herd, on eral bloom and c tion, was a na first over Forum tiac Queen of the herd. A strong was Fair Oaks De Nellie. The two ners in this class gether with the wi of the 4-year-old class, Long H Mercedes Butter Boy, who finall came grand champion, made a tr wonderful matrons. Carnation Bonnie owned by Carnation Farms was junior champion.

The aged bull class, second probably, to the aged cows, bro out the grand champion to head line-up in Harry Waldorf of Cer owned by James C. Chamberli Washington. Junior champion was Carnation Romeo Cola owned by Carnation Milk Farms.

The Brown Swiss

Judge: P. M. Brandt, Oregon.

The Brown Swiss show was a couragement. It was entirely a cific Northwest show in which breeders brought together a very bunch of this useful dairy b There is a spirit of progress pre ing among the little group of B Swiss breeders in the Pacific N west that is beginning to leave mark. This year the young stock the bulls were unusually good, a dition which is eminently correct a showing of cattle of the relat undeveloped status of Brown S in the Pacific Northwest.

This year a new Oregon was in the list, and it a popular decision when out this herd, that of F. W. Freur Sons, came the senior and g champion bull, Nellie Ella's Lad. of the Brown Swiss herds in the are working dairy herds and par larly is this true of the Freund

BROWNE OF C. H., JUNIOR AND GRAND CHAMPI BROWN SWISS FEMALE

has to make money for its own- a commercial dairy herd up in igh country of Central Oregon. yd's Lady, owned by Peringer and an, a cow with great evidences pacity and a good top line, took place over a stablemate. This lso took first as an aged cow g an official yearly record, but shown as an Advanced Registry vith two of her progeny, was d by her stablemate, Mascott's y. The grand champion female Browne of C. H., a senior heifer owned by Peringer and Salz- Washington.

The Guernseys

lge: Ralph Tratt, Wisconsin.

ht exhibitors of Guernseys made first class show. Two eastern , that of the Wm. Larsen Can- Company, Wisconsin, and the J. enney herd from Emmadine , New York, gave the tone to ntry list. The former herd took grand champions, while Em- ie Farm presented the junior pion bull, Resolute's Eminent, an eated junior champion of the n. The grand champion bull was r King of Roberts from the line-up in which class he defeat- orewood Resolute for the third this season. Last year Shore- Resolute was too good, winning ecision two or three times, but xtra finish and condition of the nsin entry could not be denied season.

e great cow, Imp. County Flow- Langwater from the Larsen was grand champion after hav- been placed first in the aged lass which was the best class in uernsey show. Second place in lass was won by Imp. Gem's of the Gron. Both these cows been class winners at the Na- Dairy Show, and this year the r was second at the National second at the Eastern States. ner Emmadine entry, Admira- f the Prairie, lent quality to this taking third place, the same ng made at the recent National. urning to the aged bulls, the place winner, Weiser's King is a good bull and only the extra of eastern entries kept him .

The Ayrshires

dge: P. M. Brandt, Oregon.

e Ayrshire show was light, exhibitors only making entries. nigh light of the line-up was the from Fairfield Farm, Kansas. E. an Tassel, Washington, was the western exhibitor. Fairfield n took all the champions. Cava- Fox Trot was senior and grand pion bull without any particular ilty. Junior and grand cham- female was Fairfield Spicy Girl, was placed up over the four- old Cairncroft Primrose, winner ass at the recent National and l champion at Waterloo.

The Jerseys

dge: Sam H. Crabbe, N. Dakota.

e Jersey show with 152 entries the best ever held in Portland, nly approach having been the y show of 1920. The line-up, dominated by the entry of F. R. . California, attracted larger ds to the ringside than any other ng in the arena. The out- ling class in Jerseys was the cow class. Thirteen excel- individuals were brought before udge. The first five or six were lent, but the interest of the ring- centered around the first three. ably no single moment in the ng throughout the entire dairy division held greater grip on the ring- side than that which marked the plac- ing of Bain's Brampton Snow Pride, at the head of this class, from which point she went on to be senior and grand champion.

The Jersey bull classes were good, the aged bulls and two-year-olds par- ticularly so. The latter class con- tained three champions of Pacific Coast state fairs of the current sea- son. The winner was the Bain entry, Molly's Count of La Lomita. The senior yearling class brought out the grand champion, Imperial Oreole's Prince, also from the Bain herd.

The Purina Quart is the Cheapest

Milk Pail Proof

JERSEY, Holstein, Guernsey, Ayrshire, Brown Swiss, Milking Shorthorn—Purina-fed cows have broken more than sixty state, national, and world records in all these breeds.

Yet these records don't tell the whole story after all. They only prove again that Purina makes more milk. They don't prove anything about Purina producing a cheaper quart of milk—and *that's* the thing that every dairyman wants. But here's what *does* prove Purina produces a cheaper quart.

Twenty thousand more dairymen are feeding Purina this year than fed it last year. When twenty thousand dairymen—the big ones and the little ones—the owners of purebred herds and the owners of grade herds—the eastern dairyman, the western dairyman, the northern dairyman and the southern dairyman—when *twenty thousand* change to one feed in one year, it says a lot more than any feed salesman can say about the Purina quart being the cheapest!

FARMS FOR SALE

The Dairyman in the Ozark region of Southern Missouri and Northern Arkansas operates with 9 or 10 month's open grazing on clean rolling pastures—pure fresh streams of mountain spring water—fine grained clay soil producing a wealth of grass. Mild and healthful climate, average winter temperature 41.6, average summer temperature 78.9. Proximity to the great markets of St. Louis, Kansas City and Memphis makes quick delivery and good prices. Prosperous growing communities, good schools and fine hard surfaced roads. Land can still be bought or farms rented at reasonable prices, insuring good profits for the dairyman. Write for more information about this land of great opportunity. FRISCO RAILWAY, 881 Frisco Bldg., St. Louis, Missouri. 20-Spl

215 Acres, 33 cattle, 3 horses, harvested crops, hay corn, oats, ensilage, potatoes, vegetables, auto, gas engines, machinery, vehicles, poultry, hogs, etc., all included; owner borrowed to buy farm, paid for it complete in few years and enjoyed abundant living; on stone road near RR town, hay cut usually over 100 tons; 125 acres tillable, pastured over 50 head; abundance wood, good orchard, 12-room slate-roof house, 100 ft. cement basement barn, swing stanchions & water buckets, 90-ton silo, etc. Real business chance at $9500 on good terms. W. H. MAYNARD, Strout Agency, P. O. Bldg., Canastota, N. Y.

For Sale—756 acre river plantation, 400 acres of which are in cultivation. Nice 9 room residence, piped with artesian water and natural gas, 17 tenant houses, large mule barn, dairy barn, milk room, two 100 ton silos, commissary, 70 head Jersey cattle, 40 head beef cattle, 13 head mules and horses, 30 head hogs. All kinds of farm equipment. Will sell as a walk-out proposition or will sell land separately in tracts of 250 acres. W. W. McDONALD & SON, Motor Route A South, Monroe, La. 23-2

Land in North Dakota—$5,200 is the average income per farm in North Dakota this year. Mixed farming has brought a good crop of wheat, corn, alfalfa, livestock, poultry, honey. Come to North Dakota now while acreage is still cheap and before diversified farming doubles land values. Congenial neighbors, splendid schools and churches, good roads and railroad facilities. Write for details. GREATER NORTH DAKOTA ASSN., Dept. 6, Fargo, N. D. 22-2

40 Acres Mid-West Farm with team, 10 cows and young stock, hens, harnesses, machinery, vehicles, hay, grain, etc., included; on improved road, few steps school, convenient several fine towns; 25 acres tillage; warm 5-room house, good barn for 18 head, garage, poultry house. Only $2600 complete, part cash. Details page 124 big illustrated catalog—free. STROUT AGENCY, 255-DL, 4th Ave., New York City.

240 Acre Alabama farm. Mild climate, year round grazing. Ideal location. Good markets. Write for particulars. Easy terms. W. A. KIRKSEY, Lincoln, Alabama. 23-2

Dairy Ranch 140 acres. $60 an acre including 26 cows. Southern California. BOX 343, Blythe, Calif.

FARMS WANTED

Want two 120 acre farms fully equipped. WALT MILLER, Carpenter Bldg., Milwaukee.

Fitting the Feed to the Cow

(Continued from page 1131)

of the production of the herd as it is now fed with the production from a ration and feeding according to the suggestions herein made. In making the comparison it will, of course, be necessary to weigh the milk from the herd for at least a week under present feeding and after the new ration and rate of feeding is in force for a week or so to again weigh the milk for a similar length of time. We urge that reports be made to Hoard's Dairyman of results obtained from changes made in feeding practices based on suggestions made in this article.

We realize that many dairymen may have feeds and conditions that do not come within the limitations of this article in which cases we urge personal correspondence with the editorial service of Hoard's Dairyman if suggestions are desired on how rations and feeding practices may be improved. To compile the most economical ration we should have the kinds of feed available and their prevailing local prices, as also the kinds of roughage.

We will pass over the calculation of rations according to nutrient analyses and feeding standards and in the next issue discuss air, water, minerals, vitamins, herd management, and dairymen.

U. S. National Holstein Sale

Haeger, Baird, and Darcey had a very successful U. S. National Sale at Waukesha and Watertown, Wis., Nov. 15—18. Most of the 315 registered Holsteins which they sold were good ones, a few were very good, indeed, and a few were very ordinary. It seemed to us a good sale where cattle brought pretty well what they were worth,—a sale to suit both buyer and seller.

The 315 head brought $84,190, an average of just over $267. One hundred sixty animals averaged $287.50 at Waukesha; at Watertown 155 head averaged just over $246. Sixty-three head sold for $300 or more, 21 reached $500 or above, and five went for four figure prices.

The outstanding animal of the sale was Maggie Calamity Hartog, a 9-year-old cow consigned by Houck Bros. of Ontario. Not only is Maggie a cow with excellent type and good records,—she has two records of over 1,200 lbs. butter and one 1,370 lbs.,—but she comes of a good producing family and she is the dam of Decreamco Calamity Posch, the Detroit Creamery Co. Farms' junior herd sire that has been a winner wherever shown this fall. A good many breeders would have liked to own the cow, and several bid on her, but in the end she was struck off to the Detroit Creamery Co. for $5,000 with R. V. Rasmussen of Illinois the last contending bidder.

The highest priced bull and the second highest priced animal of the sale was Logan Ormsby Segis Fayne, a yearling son of that great cow, Side Hill Ormsby Segis, that produced 941 lbs. milk, 38.5 lbs. butter in 7 days and over 1,100 lbs. butter from 26,000 lbs. milk in a year in subdivision B. The bull was consigned by John R. Logan & Son of Illinois and purchased by the Side Hill Bull Club of the same state.

All of the other animals reaching the $1,000 mark were bulls. Houck Bros., Ontario, consigned a 10 months' old calf whose dam made 32 lbs. in 7 days and is making over 1,200 lbs. butter, 28,000 lbs. milk in a year as a 4-year-old, most of the time being milked only twice or three times daily. He went to the Jefferson County Asylum for $1,550.

A 35-lb. son of Sir Inka May consigned by Carnation Milk Farms sold to C. H. Anderson & Co. of Maryland for $1,500, and a 4-year-old son of Wisconsin Pride 2nd and Admiral Ormsby Fobes consigned by E. L. Hotchkiss, Virginia, brought $1,325 from H. C. Tills and Dave Lorfeldt of Wisconsin.

Haeger, Mack, and Wood did the selling.

Those animals selling for $300 or more and buyers are listed below:

C. H. Anderson & Co., Maryland	
Sir Inka May 11th	$1,500
Steinbach Bros., Wisconsin	
Segis Artis Dorothy	$400
Burton Rita Prospect	400
Thos. R. Vincent, Wisconsin	
Walcowis Ollie Ormsby Canary	$480
Baltz Hoesley, Wisconsin	
Carnation Josephine Ormsby Canary	$330
A. C. Oosterhuis, Wisconsin	
Milford Pontiac Ormsby	$500
Martin F. Morgan, Indiana	
Pabst Prilly Virginia Johanna	$550
Lee Larimer, Pennsylvania	
Oriole Home Netherland Star	$300
Otto Zimmerli, Wisconsin	
No. 224	$325
George Schumacher, Wisconsin	
Jessie Pontiac Polkadot	$325
R. F. Clark, Wisconsin	
Creamelle Sir Ollie Madrigal	$310
Carl E. Rudolph, Illinois	
Sir De Kol Ollie Creamelle	$310
Bess Ormsby De Kol Burke	575
Side Hill Bull Club, Illinois	
Logan Ormsby Segis Fayne	$2,000
Wis. State Reformatory	
Juneau Homestead Fobes	$340
Pabst Arbutus Burke	450
Paul Smith, New York	
Ormsby Pabst Burke	$875
Wis. Industrial School for Boys	
Mercedes Barbetta De Kol	$335
Bess Terracelawn Ormsby	350
L. G. Blood, Wisconsin	
Ollie Ormsby Mercedes	$350
Alvin Burbach, Wisconsin	
No. 264	$300
L. R. Siebecker, Wisconsin	
Hoesley Veritis Homestead Joe	$575
Milwaukee Co. Institutions, Wisconsin	
Sir Ollie Pontiac De Kol	$500
D. W. Norris, Wisconsin	
Miss Ormsby Pride Supreme	$325
Lena Pontiac Colantha	380
Wis. State Hospital for Insane	
Branline Lena Pontiac	$310
Nockdair Homestead Fobes	350
Geo. J. Weiner, Wisconsin	
Sir Perfection Ormsby Pontiac	$460
T. C. Hoesley, Wisconsin	
Ormsby Pontiac Walker Oldenburg	$370
C. K. Fleming, Wisconsin	
No. 341	$370
C. W. Newman, Indiana	
No. I	$500
Toledo Bull Association, Ohio	
Dutchland Creamelle Prince Denver	$675
H. C. Tills & Dave Lorfeldt. Wisconsin	
Admiral Ormsby Pride	$1,325
Edw. E. Carman, Minnesota	
Governor Admiral Ormsby	$725
Arbu Farm & Kennels, Michigan	
Mountain Ash Colantha Ormsby	$675
Colantha Mutual Fobes	410
Miss Pietertje Maid Mixture	775
Waukesha Co. Asylum, Wisconsin	
Mountain Ash Colantha Valentine	$400
Wis. School for Deaf	
Sir Ollie Korndyke Ormsby Johanna	$460
Heidelkiss Ophelia Pride	350
C. E. Tuffle, Wisconsin	
Swartz Pontiac Honor	$400
H. A. Nelson, Wisconsin	
Meadowmere Ormsby Queen	$315
E. J. Hanson, Minnesota	
No. 46	$725
Detroit Creamery Co., Michigan	
Dicmere Ann De Kol Ormsby	$630
Beauty of Highland Farm 4th	350
Maggie Calamity Hartog	5,000
Mercedes Jewel Ormsby Queen	630
Colantha Parthenea Netherland	350
S. S. Foster, Wisconsin	
Korndyke Pontiac Rue Bess	$300
J. J. Stieb, Indiana	
Monclova Prilly De Kol Clytice	$350
Wm. A. Nehrbass, Wisconsin

This Book Saves Hours of Needless Hard Work

THE other day, a prominent farm paper editor made this startling statement: If the average dairyman would sell a third of his cows — even letting a blind man pick out the ones to keep — and feed the remaining two-thirds according to the latest methods, he would make more money with a third less work. And he proved it with figures!

Why work your life away needlessly, when a postage stamp will bring you this free book of practical, tested rations for business farmers? Learn how to make higher profits per head, with Linseed Meal and your home-grown feeds.

Mail the Coupon! **Linseed MEAL** The Universal Protein Feed

A Vest Pocket Herd Book is a good investment

Swedish Cow Testing Associations

(Continued from page 1136)

finished, giving the results for each cow and totals for each herd.

7. Report to the supervisor any inaccuracy or doubtful practices on the part of the owner of the cows.

The association officers, working gratis:

1. Keep a record of the finances in the association.

2. Control the work of the tester.

3. Report to the supervisor any doubtful practices regarding the work of the tester or members of the association.

The duties of the supervisor are:

1. Superintend the work in the county associations.

2. Enlist more farmers to test their cows.

3. Give an annual printed report of the results obtained in each association during the year. In this report the names of all men in the association, number of cows, and their average production are given.

Government Aid Given

The state and county spend a great deal of money in keeping up test association work. In addition to hiring the supervisor the state gives each starting association about $110 for buying equipment. Small farmers get the preference in this aid because associations having more than 500 cows or less than 8 members do not receive so much. County appropriations vary in different counties but as an illustration, one county in central Sweden, Ostergotland, gives $30 to a starting association having at least 8 members. Thereafter it gives an annual graduated sum, depending on the number of cows in the association. Those with 251 to 300 cows receive $20, with 201 to 250 get $30, and those with less than 200 get 55 cents per cow up to a $45 limit. In addition each member with less than 25 cows receives 55 cents per cow to help pay the tester's fees.

Swedish testing associations are usually smaller than those in the United States, there being few associations with as many as 600 cows, while some have as few as 150. If a herd has more than 50 cows the tester spends at least two days on that farm. When the herd number exceeds 150 he works there at least three days and the number of the herds in the association will be correspondingly less.

Three Testing Periods in Use

The testing program in the entire country starts the first of November and ends the 31st of October the next year. This, for statistical purposes, is far superior to the system in vogue in the United States where the associations begin and end their year in every month. In most associations in the United States the monthly testing period is used. In Sweden, however, there are few associations working on monthly periods, for it is felt that this does not give reliable enough figures to serve as an indication of the productive ability and breeding value of the cow. This period is used only in associations with small herds or in herds where no breeding stock is produced, as dairymen raising stock for breeding purposes must test their animals at least once every 21 days. Most men rearing animals to sell as breeding stock test every 15 days. The number of herds in each association will therefore depend on the length of the testing period.

Cost to Farmers is Low

The tester's salary ranges from $250 to $300 a year with free board and free transportation from farm to farm, as well as free railr transportation in the district. S of the farms in the association many miles apart, so the tester r reach them by train. The farm expense for the testing runs f 25 cents up to $1.00 per cow year, depending on the size of association and the amount of mo spent by the county. Becaus county aid many farmers with s herds pay very little.

Farmers usually milk their c three times daily so long as they more than 25 lbs. of milk a The tester weighs the milk from cow at each milking and takes a s ple for fat test. This sample certain per cent of each milking cured by running a pipe with a ing end to the bottom of a cylin cal pail. The samples are kep small glass bottles in a locked The fat content is then obtained a Lindstrom buturometer, a Swe test similar to the Babcock.

Tests Made on Yearly Basis

All figures are given for the a al year and not for the lacta year. In that way they get a time record for the cows. The testing association member have all of his cows tested. He is allowed to take away some of poorest unless he disposes of t entirely. Even though a cow comes sick, has an abortion, or fers from other abnormality, her erage must be figured with the of the herd until she is sold. Sh a cow that has once been milke dry for six months in a year, average would still be figured on year basis. A farmer receives advantage from manipulating the tation period of the cow to get a production in a single year, fo the long run a cow will give the b est production when she drops a a year and it is the long time re a Swedish farmer looks for. records for sale catalogue purp are figured for at least three secutive years unless the femal question is too young to have su record behind her.

Results of Testing Work

The Swedish farmer does not g for spectacular yearly productio individual records are probably so high there as in the United St However, there are some very s ing examples of the value of work. The average production the cows in a single breed comp well with those in America. In county, Ostergotland, where the tal number of cows tested is 21 thirty per cent of all pure-bred shires gave more than 10,000 milk a year. Fifty per cent h fat content of more than 4 per In this same county 39 per cen the pure-bred Holstein-Friesians more than 11,000 lbs. milk and 400 lbs. fat. In one association Ayrshires averaged 8,542 lbs. and 352 lbs. fat. These aver hold in spite of the fact that a the cows owned are averag whether they were milking the y year or not.

There has been a steady incr in the production of animals in ing associations there. In th years from 1911 to 1921 the ave butterfat production for all the on test in Sweden rose from 218 to 229 lbs. In the county of Ma Southern Sweden, the average duction for 10,960 cows on te 1901 was 6,266 lbs. milk and lbs. fat. This average had incre

(Continued on page 1175)

Artificial Lights

few years ago any flock owner tried to boost production by the f artificial lights was considered candidate for some detention col- Aside from lack of proper bal- he was also accused of cruelty to als and "busting up" the hen's . The first person to try any venture or innovation is accused e same way but others gradually n line and follow the lead. The has happened in this case since ood flocks now lighted are be- ig exceptions.

ong the experiments designed to ver the actual money value of vs. no lights was that at Ne- a. They found that one pen of ghorns that were lighted during riod of six winter months re- d $25.44 more than another pen ghted.

npilations at Ohio show that the costs per dozen eggs in lighted was 15.3c while in unlighted it was 21.1c. A profit over feed $1.37 per bird when lighted and er bird when not lighted.

hts will not necessarily increase uction for the year but they will to increase the per cent of eggs ned during the winter months. station found that the use of increased the average profit ten per bird after paying for the care.

When to Use

ere are four general systems in 1, morning; 2, evening; 3, morn- nd evening; 4, night lunch. sed on economy of fuel, No. 4 is ost efficient because of a shorter f lights.

actual practice morning lights ost used because of ease in ing a clock switch, giving lights ore time and because of greater arity. It is also easier to get the down off the roost. Lights at or 5:00 a. m. will give almost leal twelve-hour day.

ening lights offer greater opportu- y for irregularity because of so- ngagements, afternoon meetings, other excuses. It is necessary to some sort of dinner with this m.

ne flock owners are so situated lights for a short time in the ing and again in the evening ing at dusk is most advisable. rning lights are cut off as soon becomes bright in the house. ing lights start at dusk.

of the systems have their adher- all of them give results when rly used; all of them can go g if improperly used. The first only principle consists of using s not in excess of twelve to thir- hours a day, absolute regulari- nd heavier feeding. The extra means all the hard grain that the will clean up.

Light Arrangement

ctric lights, gasoline lanterns, or kerosene lanterns may be used. sene is best suited as a dimmer lectric lights as a means of get- ting the flock back to roost after an evening feed.

New York State College of Agriculture recommends:

1. Lamps

a. One 40-watt Mazda lamp for every 200 square feet or major fraction of floor space.

b. Locate lamps six feet above floor and about ten feet apart.

2. Reflectors.

a. Cone shaped, sixteen inches in diameter, four inches high.

b. Reflecting surface painted with three coats of aluminum bronze.

The Delaware Station derives the following conclusions:

1. Artificial lighting increases winter production.

2. Artificial lighting makes the production curve approach more nearly the price curve in winter.

3. Lights were of no value after March 1 in stimulating production.

4. Lights must be discontinued gradually to prevent disaster.

5. Early hatched pullets, subject to fall molt, may be carried over this period by lights.

6. Eggs can be produced cheaper with lights in winter than under natural conditions.

7. Pullets in lighted pens return greater profit over feed than unlighted pullets.

8. Use of lights is not harmful to flocks when one does not exceed twelve to fourteen hours a day.

9. Proper arrangement of lights is important.

10. Artificial lights, properly installed and managed, are a profitable investment.

Results

Artificial lighting is held accountable for many ailments. Some believe that lights tend to force production and result in poor hatches the following spring. Anything when carried to extreme can be harmful. If one forces production by lights to such an extent that a loss of weight is noticed and the fowl is run down, poor results will be noted. Heavier feeding is required.

It is also important to have a constant supply of water available. This means except when milk is fed.—J. B. HAYES.

Paralysis

We are having trouble with paralysis in our cockerels, pullets, and old hens. Can you tell us a cause of this and give us a remedy? We had no trouble until chicks were eight weeks old. We had them in new houses on new ground, entirely away from hens, and are on free range in alfalfa fields, with fresh running water.

West Alexander, Penn. C. L. K.

This paralysis which you are experiencing in your flock can, of course, be due to worm infestation and it may also be possibly due to another form of range paralysis that has apparently just been discovered recently. This too seems to be associated with a very minute type of worm that a casual observance would never detect, but can be upon laboratory examination.

I should suggest that one of the sick birds be sent either to your experiment station or to a veterinarian equipped to make a very thorough examination of these in order to definitely determine the cause.

I don't know of anything that a person can follow in the way of treatment except prevention, such as you have attempted at this time. Even though you may have trouble with this, I believe you will find that the results obtained by following out the program which you are now doing—that is, clean range and various things of that sort, will react favorably anyhow.

Some of the eastern farms have even found it necessary not only to follow the practice of using clean range, but also to screen with fly screen the windows and doors of the colony houses and also cover the small outside range which the chicks may have available for them, in order to prevent the spread of tapeworms particularly through the flies.

If we knew definitely what the cause was by examination, we might be in better position to give a definite recommendation.—J. B. HAYES.

Wisconsin Egg Laying Contest

Persons desiring regular reports of the Wisconsin Egg Laying Contest may secure the same by writing Secretary E. W. Bentzien, 200 18th Street, Milwaukee, Wisconsin. These reports will summarize the production and feeding of contest flocks as also the expense and income derived therefrom.

At the Canada Experiment Farms in an experiment in which one lot of birds received 4 c. c. of cod liver oil daily, no appreciable effect was noted in increasing either the gross egg weight or the weight of the shell.

Abortion—Retained After Birth—Calf Scours

Free Book tells what to do

How to turn losses Cows Calves Poultry Pigs into Profits

For 15 years we have been watching the use of B-K on the farm and checking up our observations with laboratory tests. Our book gives you the results of this vast experience without cost. The book covers:

Abortion is caused by germs of several kinds. What they are and what can be done in prevention and control is told in our book.

Retained Afterbirth—How to reduce adhesions, bring safe, natural removal without manual help, and heal the tissues.

Calf Scours—The cause, how to prevent and save your calves.

There is No Substitute for B-K

B-K is made by our special process, which produces the only stabilized hypochlorite ever approved by the American Medical Association. Its germ destroying power is 10 times greater than that of undiluted carbolic acid, yet B-K contains no poison, or acid, and leaves no odor.

B-K is dependable. Your money back if not satisfied.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Functioning of Udder Quarters

There is a common belief to the effect that when a cow loses the function of one quarter of her udder the remaining quarters take up the work of the lost one and produce practically as much milk as would the normal udder. There must be some grounds for that belief considering its popularity and the persistence with which it is asserted by many dairymen; but, theoretically, at least, it is not based upon sound anatomical or physiological facts.

It has been proved by experimentation that there is no connection between one quarter and its mate, or between the two halves of the udder. The two halves are separated by a well marked partition or septum of fibrous tissue and the quarters are as perfectly separated, although one cannot see a dividing partition as one can when dissecting one-half of the udder from the other half. The fact that there is no connection between the quarters has been proved by stripping the udder clean, injecting a different colored fluid into each quarter in turn and shortly afterward slaughtering the cow and examining the treated quarters. It has been found by so doing that there is no mixing of the colored fluids; that injected into each quarter retains its original color. From this it must be concluded that each quarter secretes or elaborates its own quota of milk in readiness for each milking time and that one quarter does not send milk into another quarter; but there is another consideration which must be taken into account and that is the blood circulation of the udder.

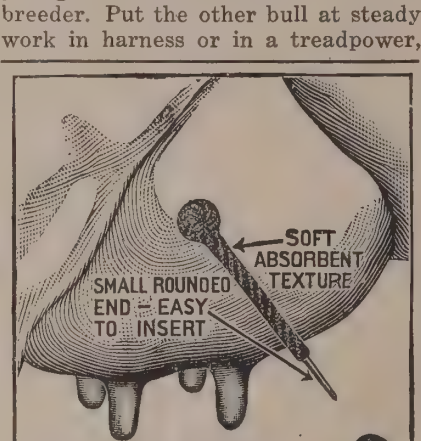
The udder or mammary gland is richly supplied with arterial blood from which is derived all of the ingredients of milk. When anything occurs that lessens the flow of blood to the udder, the quantity of milk diminishes. Should circulation of blood suddenly cease, milk secretion may entirely be suppressed, the nervous system being simultaneously affected. When the amount of blood flowing through the udder is increased, secretion of milk, theoretically, should likewise increase and it does, in some measure. Both the quantity and quality of the milk produced depend upon the quantity and quality of the blood, the latter attribute depending, of course, upon the nutrients derived from the digested ration which are carried to the udder by the arteries for the manufacture of milk.

It may, perhaps, be true that when one quarter of the udder loses its function of milk secretion a large amount of the blood that normally would flow to it, and no longer needed by the idle quarter, goes to the other quarter of that half of the udder and induces it to secrete or manufacture a larger quantity of milk. That some increase of milk does occur has been noticed by dairymen but we have no actual proof that the mate of the blind quarter greatly increases its quota of milk production. The increase, if any, probably averages among the three active quarters and it does not fully make up for loss of milk due to inactivity of one quarter. The important matter, in all instances, is fully and completely to feed the cow that she may produce a maximum yield of milk, see that the ration is of proper quality, and prevent all influences that may lessen milk yield. The "three-teated" cow often is a menace, usually is a nuisance, and seldom is worth retaining.

Dehorning Cows

Please advise what period during gestation it is most desirable to dehorn milk cows, or does dehorning have any injurious effect? Is it liable to cause abortion?

Eudora, Kans. G. C. C.



It is best to dehorn cows before they are bred. Dehorning during pregnancy possibly may induce abortion or so shock the cow that her fetus incidentally is injured. The operation may also cause a shrink in milk yield. Do not dehorn cattle in very cold or very hot weather and not when they are being fed sweet clover hay. Fatal bleeding is liable to occur when cattle that are being fed sweet clover hay are dehorned or castrated. Old or moldy hay of that sort is most dangerous.

Barren Cows

I have trouble getting my cows to breed. I think it is the fault of the bull. He is four years old and in good shape. He is in a 2-acre pasture by himself; has good grass, plenty good water, and am feeding him green fodder with the corn on. He is awful slow to perform and the cows fail to get with calf. What is the remedy?

Columbus, Kans. J. W. C.

Better breed the cows to a vigorous young bull that is known to be a sure breeder. Put the other bull at steady work in harness or in a treadpower,

or make him take active outdoor exercise daily in some other way. Letting a bull butt at a big smooth stump or block of wood suspended by chains from an overhead beam in his paddock is a good way of inducing exercise. A big empty oil or molasses barrel placed in the paddock also serves the purpose. Stop feeding corn and substitute oats, bran, and oil meal along with a legume hay and some roots. If the cows do not conceive when served by another bull it will be necessary to have your veterinarian treat their generative organs with antiseptic solutions.

Garget

Will formaldehyde kill the garget germ in cows? How much and how should it be injected in the bag and how much should be fed to a cow? I have a cow that a while ago had it in one of her hind teats, then the other one, and now she has it in the front teat; it seems to travel in her bag.

Becker, Minn. T. S.

Formaldehyde (formalin) is given internally as a remedy for mastitis or garget. The dose is 2 to 8 drams, given in one quart of milk, night and morning, for 3 or 4 days, under direction of the veterinarian. The medicine is a strong irritant and therefore must be carefully used. It should be discontinued at once if any derangement of the digestive organs is noticed. It must *not* be injected into the udder. It may be added that established mastitis is incurable. Isolate an affected cow and cleanse, disinfect, and whitewash the stall she has occupied, including the floor and gutter. Destroy abnormal milk. Have your veterinarian give hypodermic treatment with anti-mastitis serum at the outset of an attack, and treat the unaffected cows with a herd autogenous mastitis bacterin as a preventive.

Heaves

I would like to know if you could give me any information on how to help a horse with the heaves.

Austinburg, O. W. D.

Heaves (emphysema of the lungs) is incurable when established. The distress may be relieved and the horse enabled to work by the following procedure: In summer, let the animal live on grass, without hay. In winter feed oat straw or oat sheaves and bright corn stover instead of hay. Also feed oats, bran, and carrots. Add ear corn in extra cold weather. Do not give any bulky feed at noon when the horse has to work, and do not let him work immediately after a meal. Keep the bowels active. Wet all feed with limewater. If these measures do not suffice, also give one-half an ounce of Fowler's solution of arsenic, night and morning, sprinkled on the feed or given in a little water by means of a dose syringe. Proprietary heave powders are also helpful.

Chapped Teats

My cows all have chapped teats. They have a dry place day and night.

Oshkosh, Wis. L. B.

Cleanse the teats each time before milking and milk with dry, clean hands. After milking immerse the teats for 5 minutes in warm water containing one teaspoonful of coal tar disinfectant per pint. In the evening apply a soft paste of cold-pressed castor oil and bismuth subnitrate. After two days of treatment omit the immersion process. If any sore is tardy in healing apply strong iodine ointment once or twice daily.

About Pennyroyal

If a cow eats pennyroyal will it cause her to abort?

Endeavor, Wis. A READER.

Oil of pennyroyal has poisonous properties; keeps mosquitoes away, and in large doses, taken internally, so deranges the digestive organs that abortion incidentally may occur. We have never heard of the green plant injuring animals.

Swedish Cow Testing Associations

(Continued from page 1172)

by 1923 for 31,338 cows on test to 8,700 lbs. milk, 294 lbs. fat.

Utilization of Cow Testing Association Figures

Originally the main purpose of the cow testing association work was to give farmers advice as to the right way of feeding and to show the difference in the way individual cows would utilize the feed. As time has gone on, however, the figures have taken on more and more importance in breeding work. They have received more and more official value until now they have become the basis for the whole breeding program and for the awarding of prizes at shows.

In every sales catalogue, yearly records for the females in the ancestry are given and these records must always be an average of at least three years' production, providing the animal is old enough. The records for all animals in a pedigree can now be secured for several generations back. The feed units consumed, the percentage of fat, pounds of butterfat, pounds of milk, and even the kinds of feed consumed can be secured for the ancestry of every bull or female offered for public auction today. No bull can be sold for breeding purposes in any official sale or be awarded prize of any kind from governmental funds or admitted under the government scheme for improvement of the cattle breeding, either crossbreeding or pure breeding, if he has not behind him complete production records for all the females in his ancestry during three generations on both father's and mother's side. No one will buy a female for breeding purposes if she does not have a similar production pedigree, because sons can not be sold from her for breeding purposes.

Production, too, has become a necessary qualification for admission into the herd books for all the breeds. It is not enough to be a good show animal or to have a pedigree ancestry, for unless the female of, for example, the Ayrshire breed, produces at least 242 lbs. fat for a three-year average and gives milk with a butterfat percentage of at least 3.5 per cent, she cannot be registered. All in all these records are the basis for most of the constructive work in dairy breeding and feeding that is being done in Sweden at the present time.

Feeding Iodine to Pigs

When we think of feeding iodine to live stock we usually think of it in connection with the prevention of goiter or hairlessness in pigs, calves, and lambs. John M. Evvard of the Iowa Experiment Station has pushed the inquiry further than this by showing that iodine has beneficial effects on the growth of pigs in a section where goiter or hairlessness in pigs rarely occurs.

During 14 years at that station where from 300 to 800 spring pigs and from 150 to 300 fall pigs were farrowed annually, no recognizable goiter symptoms were observed. In spite of this, three carefully controlled experiments resulted in a significant influence of iodine in each of them.

The first experiment conducted during the summer of 1920 was a comparison of two lots of 50-lb. pigs grazed on rape pasture. In addition to pasture, each lot had shelled corn mixed yellow and white, self-fed; plus a supplemental protein, vitamin, and mineral feed mixture composed of tankage, 30; corn gluten meal, 15; corn oil cake meal, 20; linseed meal, 10; cottonseed meal, 20; bone meal, 3; and flake salt, 2 pounds, self-fed, plus block salt, self-fed. One lot received, in addition to rape pasture and the above feeds, potassium iodide incorporated with the supplemental feed mixture at the rate of one-tenth pound to each 1,000 lbs. of the supplemental feed mixture.

The average daily gain of the iodide-fed pigs was 8.4 per cent greater and the feed requirements for 100 lbs. gain 12.5 per cent less than for the pigs not receiving iodide.

The second iodine feeding comparison was made in 1921. Two groups of 50-lb. pigs were fed in dry lot. The check group to which no iodide was fed received a basal ration of shelled corn self-fed; plus a supplemental feed mixture composed of prime cottonseed meal 80 parts and Armour's dried blood meal 20 parts; plus 10 per cent of a mineral mixture composed of 33.33 pounds each of finely ground high calcium limestone, flake salt, and bone meal. The supplemental feed mixture and the mineral mixture were put together in the proportion of 100 lbs. of the feed plus 10 lbs. of the mineral mixture and this was self-fed.

The iodide-fed group was fed exactly the same except that one-tenth of one pound of potassium iodide was mixed with 100 lbs. of the mineral mixture and then 10 pounds of this new mixture incorporated with each 100 lbs. of the supplemental feed.

The pigs receiving iodine made 8.3 per cent greater average daily gain on a feed requirement of 9.4 per cent less than for the pigs that did not receive the potassium iodide.

A third iodine feeding trial was made during the winter of 1923—24. A check lot of pigs weighing about 67 lbs. each was self-fed shelled corn supplemented by a protein feed mixture composed of cottonseed meal, 30; corn oil cake meal, 20; linseed meal, 15; standard wheat middlings, 10; soy bean oil meal, 14; peanut meal, 7; and alfalfa meal, 4 pounds, self-fed. In addition to this, these pigs received a mineral mixture composed of flake salt, 20; finely ground high calcium limestone, 40; spent bone black, 40 pounds, self-fed.

The iodide fed pigs received the same feeds as were given the check lot but in addition, .05 lb. or one-twentieth of a pound of potassium iodide was mixed with each 99.95 lbs. of the mineral mixture.

The pigs receiving iodine made an average daily gain of 13.05 per cent more on 8.04% less feed per 100 lbs. than the check pigs that did not receive iodine.

The results of the three experiments averaged show that the average daily gain was increased by 9.91 per cent and the feed requirement for 100 lbs. gain reduced 9.98 per cent as compared with similar pigs fed exactly the same but without the iodine.

Greatest Return From Skimmilk

Numerous feeding trials have demonstrated the superior merit of skimmilk as a supplement to cereal grains for feeding swine. In feeding this valuable supplement the proportion of it to grain fed is of considerable importance in getting the greatest return for a given amount fed. Experimental evidence indicates that maximum returns are had when 2 to 3 pounds of skimmilk are fed with each pound of grain. This applies only in dry-lot feeding and when skimmilk is the only supplement fed. If alfalfa hay is also put before pigs the amount of skimmilk could well be reduced.

Corn Not Enough

The effect of a ration of straight corn in comparison with a balanced ration is strikingly shown in experiments conducted at the Iowa Experiment Station. Yearling sows fed corn alone farrowed pigs that averaged 1.85 lbs. at birth, whereas similar sows fed corn and tankage containing liberal amounts of lime and protein farrowed pigs that averaged 2.42 lbs. at birth. Pigs from gilts fed corn alone averaged 1.74 lbs., while pigs from similar gilts fed corn and alfalfa hay averaged 2.29 lbs. at birth.

This striking comparison suggests that inadequate foetal nourishment may be the forerunner to the runt pig.

Record Breeding Dates

A timely reminder is that the dates of breeding each sow when recorded and filed safely will come handy next spring. A good many sows have had to farrow in unfit places because their owners failed to record the dates of service and thereby failed to provide proper housing facilities in time to save the pigs.

W. H. Peters of the North Dakota Experiment Station makes the following conclusions from observations of pregnant sows fed alfalfa hay in cheaply constructed racks as a supplement to a grain mixture of two parts crushed barley and one part bran by weight fed as a thick mash with warm water:

It was possible to replace one-third of the grain for sows with alfalfa hay. It required 1.04 lbs. alfalfa hay to replace one pound of grain. The feeding of alfalfa afforded an excellent means of getting the sows to take more exercise than they do when fed grain alone. No trouble was experienced by any of the sows when farrowing. The sows fed alfalfa hay appeared to milk better and nurse their pigs a little better than did those not receiving hay. The results obtained indicate that it is practical and advisable to feed as much alfalfa hay to brood sows in winter as they will eat, regulating the additional grain to keep the sows in proper condition.

Obtaining Money From Intermediate Credit Banks

(Continued from page 1135)

ability to feed. Other borrowers want to send some dry cows to the butcher or add to their herd. By putting up some or all of their other cows as collateral they frequently can borrow full purchase price. However, the ordinary procedure is to lend 50 to 60% of the value of the dairy cattle and take a chattel upon them and the other stock, horses, and implements.

In different parts of the country collection practices vary. In some the loans are made with a provision for repayment over a series of months. Where the dairyman is delivering milk or cream to a creamery, cheese factory, or condensery, such a method may simplify collection materially if the dairyman agrees to the institution's deducting the monthly payment from the amount due him and mailing it directly to the credit corporation. Frequently such loans run 15 to 20 months. In other instances loans are usually made for 12 months, at the end of which time settlement in full is made. In still other cases the lending agency collects directly from the farmer a stipulated amount each month or three or six months until the loan is paid off.

Agencies which rediscount agricultural paper with the Intermediate Credit Banks can not at present charge more than 7% on live stock or dairy loans.

Throughout the United States there are 557 rediscounting agencies doing business with the 12 Federal Intermediate Credit Banks and the number is increasing. To date they have rediscounted more than 130,000 individual loans aggregating in excess of $180,000,000. Direct loans to farmers' co-operative marketing associations have exceeded $400,000,000 whose membership is approximately a million farmers. These co-operatives have borrowed on wheat, wool, cotton, tobacco, raisins, peanuts, broom corn, beans, rice, alfalfa, red top seeds, hay, nuts, canned fruits, vegetables, syrup, dried fruits, coffee, olives, and olive oil. Strained honey and powdered milk will likely be added to this list in the near future.

Let me but do my work day to day
In field or forest, at this desk or loom,
In roaring market place or tranquil room;
Let me but find it in my heart to say,
When vagrant wishes beckon me astray,
"This is my work; my blessing, not my doom,
Of all who live, I am the one by whom
This work can best be done in the right way."

—HENRY VAN DYKE.

Corn Improvement in Various States

(Continued from page 1135)

between moisture in the corn, quent low temperatures, and the ntage of germination. The corn ation studies in Nebraska have referred to elsewhere. Studies the prevalence of root rots of in Nebraska have shown little le from that source as yet. es in inbreeding and crossbreed- f varieties have been under way veral years.

Minnesota, some excellent work een done in the crossing of dent flint varieties of corn in the en- r to increase hardiness and The results have been fairly actory. Selfing and crossing are an important feature of the Min- a corn program.

J. Kinney of the Kentucky Ex- ent Station says that, like every experiment station, they are g every method of corn breeding seems to offer chances of im- ement. An endeavor is being made present time to get a good strain rn for Kentucky by selfing corn number of years and then com- g the best of the inbreds.

the Iowa station the crops de- ent has been sponsoring the corn yield contest. This work eceived national attention. Hun- of farmers have entered this st and the testing of varieties different sections of the state elped to establish many of the yielding strains. The Iowa Sta- co-operating with the U. S. De- ent of Agriculture under the ion of M. T. Jenkins, is carrying very intensive program of selfing us corn belt varieties. Some es have been made and are being out. Within a very few years outstanding varieties will, with- oubt, have been originated.

Kansas, it has been established the variety, Pride of Saline, is minently adapted to the eastern hirds of the state. In the time- unting and method-of-planting iments, listed, surface planted, pen furrowed planted plots have ed approximately the same. In ime-of-planting tests, the early have, on the average, been t to give the best results. The yields over a period of years are y the same from the 10th of to the first of May.

porting for Oregon, E. N. Bress- of the Oregon Agricultural Col- says that the planting of the ty known as McKay yellow dent ilage has been the biggest step corn improvement. Intensive ling work will be carried on with variety. Striking results have secured with land plaster (cal- sulphate) on seed corn. Greater of seedlings and a cleaner and r growth of plants has been not- llowing its use.

e Dakotas and Montana are pay- ncreasing attention to corn each and the acreage devoted to this has been increasing. In South ta a variety of corn has been ated through the combining of al varieties, and it is called All- ta. Work in South Dakota has ed in increasing and decreasing ercentage of oil and of protein in In North Dakota variety tests number of years have resulted e determination of seven varie- which are recommended for dif- t sections of the state. The use osphorus and manures on corn esulted in increasing the earli- of maturity of several varieties. nsive work in inbreeding is now e North Dakota corn breeding am. Montana Station authori- hrough variety trials have estab- lished the best varieties for the differ- ent sections of the state. Northwest- ern Dent, Minnesota 13, Gehu flint, and Dakota white flint have proved to be especially valuable varieties.

It may be said for most of the corn states at the present time, that the best varieties have been pretty well established and that work along cul- tural lines and especially along in- breeding and crossing lines will henceforth predominate. Despite all that we have learned about this cere- al, the field of investigation is still large and one finds it hard to prophe- sy as to just what the future will re- veal in this interesting line.

(EDITOR'S NOTE:—This is the first of a series of articles on corn by Mr. Biggar. The next article will appear in an early issue.)

Hunter of Kewaunee

(Continued from page 1133)

forth the candle molds. They were usually arranged to make candles about a foot in length. They were made of tin and tapered towards the tip. A wick ran through the center of each mold and was held by cross stick. Since deer were plentiful, most of the candles used in our family were made from deer tallow. These burned longer and gave a better light than beef tallow candles.

These candles were used for several years. But the time came when can- dles were a thing of the past. The kerosene lamp had come to stay. In those days petroleum was so impure that explosions were quite common. I remember distinctly at seven or eight years of age seeing my father quickly open the door and throw a fluttering lamp out into the snow. Candles were used the rest of the evening.

People cherished these lamps and dressed them up so that they really became an ornament in the home. People were so economical that they often sat and told stories by the big fireplace or in front of the cook stove. It was quite common for the family and neighbors to sit around large fires outside especially in the summertime. There was a profound feeling of friendship existing between all set- tlers. If one had sorrow, there were hundreds to share it.

My grandfather always had a weak spot in his heart to own lands, so con- sequently he purchased several miles of heavy beech and maple land south of Kewaunee bordering on Lake Michigan. He purchased it directly from the government at $1.25 per acre.

We used this property for several years as a sugar bush. Making maple syrup and sugar was popular among the settlers as they had to pay money for brown sugar of an exceed- ingly poor quality. We never wanted for sugar as we tapped several hun- dred trees.

Many of the foreign settlers did not really know the art of making sugar and frequently you would find them tapping the beech, elm, and basswood, as well as the maple trees, and they wondered why sap ran from some trees and not from others. Some oozed out bitter sap, and some of the sugar made was as bad as the early butter. My grandfather was an ex- pert sugar maker and made sugar of fine quality.

The sugar bush was a noted place for the young people to gather and tell stories and sing songs during the evening. There was no social circle at which you did not hear singing. The old songs were based upon some interesting facts or legends.

Many people played instruments. The boy usually took to the violin and the girls played a melodeon or organ. It wasn't uncommon to have dances in the homes or to set the fur- niture back for a dance after an en- tertainment in the schoolhouse.

(To be continued)

BROWN SWISS

Brown Swiss Bulls Mark Imprint on Grade Herds

Extra large production in a herd of grade cows may be gained by breeding with a Brown Swiss bull. They sire strong calves of a uniform type, well adapted for the general dairy farm. Mature bulls weigh between 1,800 and 2,500 lbs.

We will be glad to help you secure a Brown Swiss bull and, if you desire, a heifer or a cow.

Jersey Bull Calves
We are offering at reasonable prices a few bull calves sired by Vive La France's Darling Son and out of cows of rich Sophie's Tormentor breeding. Vive La France's Darling Son is out of Vive La France, the first cow to make over 1000 lbs. fat and the cow whose average of 890 lbs. butterfat for first 6 lactation periods exceeds that of any other dairy cow. He is sired by Darling's Gallant Boy, the silver medal sire and full brother to Darling Jolly Lassie, 1141 lbs. fat as Jr. four-year-old. Two of these bull calves are out of granddaughters of Sophie's Agnes, the first Jersey cow to make 1000 lbs. butterfat.
THE GOLDEN GLOW JERSEY FARM KENSINGTON, MD.

Bohstedt Returns to Wisconsin

Gustav Bohstedt, chief of the animal industry department of the Ohio State Experiment Station at Wooster since 1921, has been appointed to head the research work in the animal husbandry department at the University of Wisconsin. He fills the chair vacated by F. B. Morrison who left Wisconsin this fall to direct the New York Experiment Stations.

Born in the province of Holstein, Germany, Bohstedt came to this country as a boy and spent the first three years on an Iowa farm. Moving to Texas he soon worked up to the position of foreman on a large ranch. Returning to Iowa he attended the West Des Moines high school, graduating with honors in three years' time. In 1911 he enrolled in the agricultural course at the University of Wisconsin.

Bohstedt was a brilliant student and prominent in campus activities, forensics and athletics, rowing on the varsity crew. Upon graduation from the University of Wisconsin, he was appointed as assistant in the animal husbandry department and obtained a Master of Science degree.

He then went to Ames as an assistant in the animal husbandry department at Iowa State College, and while there worked closely with John M. Evvard on nutritional research. He returned to Wisconsin and was an assistant professor in animal husbandry for several years. In 1921 he went to Wooster, Ohio.

Mr. Bohstedt has served as secretary-treasurer and also president of the American Society of Animal Production.

Premier Breeders and Exhibitors at the National

Awards for premier exhibitor and breeder in the five breeds shown at the National Dairy Exposition have been announced after complete compilations of the awards have been verified. The prize banners are being sent out to the following list of winners:

Jerseys: Exhibitor and breeder—Longview Farm, Missouri.

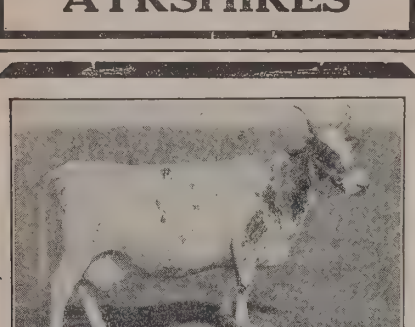
Ayrshires: Exhibitor—Strathglass Farm, New York. Breeder—Adam Seitz & Sons, Wisconsin.

Brown Swiss: Exhibitor and breeder—The Hull Bros. Co., Ohio.

Guernseys: Exhibitor—Wm. H. Williams, New York. Breeder—Emmadine Farm, New York.

Holsteins: Exhibitor — Carnation Milk Farms, Washington. Breeder—Forum Holstein Farm, Iowa.—National Dairy Association.

Love of Farm Life Brings Success



(Continued from page 1132)

Greenwood Dairy is one of the outstanding dairy farms of Crow Wing County. There is the improved soil, the fine barn built in 1922, the new combined dairy house and garage, a roomy, comfortable farm home with running water, bath, furnace heat; there is the electric power for running the milker, separator, and other machinery, and for lighting the farm buildings—in fact, there is just about everything one could even wish for at a farm home. It is unusually attractive. And best of all, it is all paid for and the Storstads have money in the bank.

Theirs is a happy family. We didn't get to see the twelve-year-old boy as he was in school that day. But we did have a good time answering questions asked by the nine-year-old daughter. When we went to take a picture of the old barn, first used by Iver, she thought it would add to the interest of the view if she were in the loft window—and so there she is!

We left the Greenwood Dairy thankful for these new friends. This Americanized son of Norway had given us a lot to think about. He had deepened our faith in the ever present opportunities of American agriculture waiting only upon human vision, intelligent work, and thrift. So long as folks like the Storstads are finding success and happiness in building real farm homes, we need not worry much about the future of America.

— Twice-a-day Milking

ANTON'S KING CONFIDENCE—43517 A. R.
Photo taken when two years of age.

SIRE—Anton's May King, sold for $7000.00. DAM—Ma Chere Confidence who has a two year old record of 511.82 lbs. butterfat and a junior four year old record of 764 lbs. butterfat. Ma Chere Confidence is one of the outstanding daughters of the famous Jardinier's Masher. A. K. C. sires excellent udders, long deep bodies, straight top lines, and real production.

You can buy bull calves out of his daughters and sired by outstanding bulls, from us very reasonably. Do not write us if you want a serviceable bull. Our males are always sold before they are old enough for service. Buy a young calf, raise it yourself, and save money. We have several nice ones on hand now — and they are priced to sell.

HERD ACCREDITED

Hoard's Dairyman Farm, Fort Atkinson, Wis.

Loeb Farm Holstein Sale

The dispersion of the Loeb Farm Holstein herd at Grand Rapids, Mich., Nov. 1—2, brought out an excellent attendance of Holstein men but because the cattle were out of condition and a number of the cows showed very poor udders, prices did not rule high. One hundred forty-three head averaged $167 with one animal going to $850, and only three others reaching the $500 mark.

The top price was for a six months' old son of that great record cow, Kolrain Marion Finderne (35,339.5 lbs. milk, 1,278.56 lbs. butter), purchased by Blissveldt Farms of Michigan.

The sale was under the management of the Melin—Petersen Co. Mack, Hansen, and Baxter did the selling with G. R. Melin in the box.

The following list includes those animals selling for $200 or more and buyers:

Walter B. Green, Michigan	
Charlevoix Ormsby Marion Boy	$315
D. E. Waters, Michigan	
Carnation Mutual Matador	$505
Carl D. Bradley, Michigan	
Kolrain Marion Finderne	$410

B. A. NORRIS, Anoka, Minn.

Three out of Five Cows can give More Winter Milk

DAIRY authorities agree that the biggest thief of dairy profits is expensive winter feeding that fails to register in the milk pails. It is claimed that three out of five cows—in the average dairy—are capable of giving more milk for the feed they consume.

Where is the leak? What is the trouble? In most cases it is a failure to fit the feeding procedure to the changing conditions of the season. Very few cows have the natural vigor and bodily health to suddenly change from pasture to barn-feeding without a let-up in production. The milk-flow falls off just when feeding costs are highest.

Outside aid is needed—something besides good feed and good housing. *Assimilation*—the ability to turn good food into milk—is the key to money-making cows in winter. Kow-Kare supplies just what every cow needs during the winter months. It acts directly on the organs of digestion and assimilation—strengthens, regulates, rebuilds.

While aiding the cow in getting from her feed every possible ounce of milk, Kow-Kare at the same time builds into her the vigor to resist disease. Its use costs nothing; the added milk yield pays for it many times over. To avoid break-downs, to insure full milkings, use Kow-Kare regularly. The investment is so slight—the results so sure. It requires only a tablespoonful of this highly concentrated regulator with the feed, one to two weeks each month, to keep each cow on the profit side of the ledger. A few cents per cow per month is a small price to pay for this profit-insurance.

Stamp Out Expensive Cow Disorders

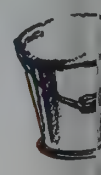
Kow-Kare—through its direct invigorating action on the digestive and genital organs—has a 30-year record of money-saving service to cow owners. In the prevention and treatment of Barrenness, Retained Afterbirth, Abortion, Scours, Bunches, Milk Fever and similar troubles Kow-Kare enjoys a well-earned reputation from coast to coast. Dairymen who know its benefits never fail to call upon this proven remedy in case of trouble.

Home-Mix Your Own Complete Mineral

With Kow-Kare you can easily mix your own complete mineral at a surprisingly low cost—a mixture of recognized conditioning value.

Simply mix 30 lbs. of salt, 30 lbs. fine-ground lime, 30 lbs. steamed bone meal and four cans (large) Kow-Kare. For well under $6 per hundred you will have an unbeatable mineral. Use 80 lbs. of this mixture to a ton of grain.

Use Kow-Kare Before Calving—It Pays



The dual function of milk-product and raising a healthy calf each y involves a strain too severe to al a valuable cow to undergo without posi outside aid. Elements that are lacking the feed—no matter how efficient the ra —are needed to aid the cow in the ter strain of the freshening period.

Kow-Kare supplies the needed help the genital organs. It builds up vitality insure the cow against the serious disor that so often follow calf birth. Feed a blespoonful of Kow-Kare with the grain two to three weeks before and after fr ening. It will be the best investment ever made. Feed dealers, general sto and druggists supply Kow-Kare. Large $1.25, six cans $6.25; small size 65c. If y dealer is not supplied, we will mail dir postpaid.

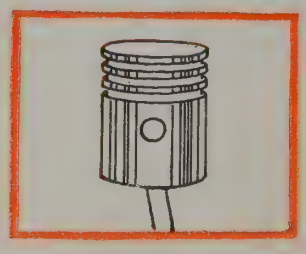
Winter dangers

which may easily cost more than a whole year's supply of oil

EXPERIENCE teaches you that cold-weather operation may be hard on the engine of your automobile or motor truck. Repair expense may pile up.

But do you know the cause of most winter engine troubles? Do you know the remedy?

Poor or incorrect winter oil in your crankcase speeds wear—perhaps 25%.



Poor or incorrect winter oil prevents quick engine response to the starter. Your batteries may need recharging frequently.

In winter, due to more frequent use of the choke in starting, extra gasoline slips by your piston rings to dilute your crankcase oil—perhaps as much as a pint in a few difficult starts.

Eight hours of cold weather driving may put a tumblerful of water into your crankcase. How? Water vapor, a product of gasoline combustion, passes the rings and is condensed on the cold walls of your crankcase before your engine becomes heated.

How to avoid winter troubles

Many cars require different oil in winter than they use in summer. The Mobiloil

PISTONS

If your car is not listed above, consult the complete Mobiloil Chart at Mobiloil dealers' for your winter grade of Mobiloil.

Engineers have gone into this perplexing problem from all angles. Through the accuracy of their recommendations and the engineering margin of safety it assures, Mobiloil has become the most popular oil in Canada, Norway, Sweden and other countries where cold is severe.

The engine in your automotive equipment has been analyzed by these experts under all extremes of temperature. The Mobiloil Chart tells you exactly which grade of Mobiloil provides adequate lubrication and brings utmost relief from hard starting, rapid wear and crankcase dilution.

This chart is approved by 609 manufacturers of automobiles, motor trucks, farm tractors and other automotive equipment.

Your nearby Mobiloil dealer has the complete Mobiloil Chart. He will give you a substantial discount on orders for barrels and half-barrels of Mobiloil. He also has the newly-designed 10-gallon drum which may give you a sufficient supply of winter oil for your car, truck or tractor.

When you turn to Mobiloil you do *not* buy a cheap oil. But you do buy the most economical lubrication.

WHICH SHALL IT BE

Phenomenal Production or a Good Average

E. L. ANTHONY

HE spotting out of a few superior producing cows, while a good thing, will not bring about rapid breed improvement. In order to produce, such animals must have the inheritance for this production. If it is there it will take care of itself in breed and herd improve-
. The vital thing, however, is to spot the low producers, those with a lack of er inheritance. They constitute the real cle to progress and must be eliminated from erds and breeds. In this our European cous- through their developed practices in herd gement and breeding, have some real lessons is. These methods we must adopt in a greater ss degree if we are to continue to move for- in our future cattle improvement. It is gen- knowledge, I believe, that the registration and g systems in Europe are much different from

hink it is a generally accepted opinion that present system of cattle registry here in the ed States is fundamentally unsound in its ba- rinciple, in that just because the sire and dam calf may be pure-bred and registered, it fol- that the calf is auto- cally qualified also to egistered and worthy e used for breed devel- ent. Such a system inues in ever increasing bers to propagate and y on undesirable ani- , and thereby lessens value of the registra- of all animals.

ch a system as we now tice with our breeds is tically unsound and of the greatest drags to d improvement that it is ible for us to practice. practice is daily be- ing worse. As we start breeders into the dairy ness and into improve- their herds with pure- s, unless they have wise guidance and sel, it is natural that will be fitted out with cheaper pure-bred cat- which in the majority cases are really cull -breds, and should in ity have been culled out slaughtered and not be wed to be used for ding purposes. New ders saddled with such ndicap are indeed to be d. Our present system egistry and dissemina- of pure-bred cattle fos- this practice. In ope such a system could be developed.

Denmark, Holland, Scotland, which are the most progressive dairy cattle sections, and in most other cattle sections of Europe, there is practiced a much more rational system of cattle registry. The Danish system, which I think one of the most rational, fairly well typifies the rest and is a system which we can well study.

In brief, only animals may be registered in the Red Danish Herd Books or Jutland Black and White Herd Books if they come from dams with certain known production records. These animals for whom registry is sought cannot be registered even if from satisfactory producing ancestry, unless they themselves are of satisfactory type and conformation. This practice, together with rational testing systems, has brought about and developed in seventy-five years' time a new breed of cattle in the Red Danish breed whose high *average* production and fixation of type is a marvel in the history of dairy cattle development and could well be the envy of any of our best breeds in America today.

The Northern European dairymen are also much ahead of us in the rational development and use of records. Their whole record system has been developed to benefit the mass rather than the individual. The whole idea and purpose of record is different with them than with us. Their control work is not developed on the basis of authenticity, but on the basis of locating undesirable cows. Records are naturally honest. There is no purpose in being dishonest. They have not developed their record work with the idea of singling out a few high producing animals for the purpose of animal, herd, or family line exploitation. They have developed it on the basis of eliminating the unprofitable cow from the dairy and thereby eliminating her from the animals which are selected for herd and breed development. The whole idea of record work is to raise the average for the herd unit and, in turn, the breed, not by spotting the occasional high producing cow but by quickly spotting out the low and undesirable producers.

European breeders cannot point out any world's record cows or class leaders in some seventy-five different classes, but they can point out with pride their whole herd average—not only for one year but more often for a five-, ten-, or fifteen-year period. They can and do point to their district average, their county average, and their average for the whole land which is well above the line of unprofitable production. The European cattle breeders are using their records for the real purpose and justification of records, the spotting out of undesirable cows and for breed improvement.

Cow testing association records are the basis for all record work in Denmark, Holland, and Scotland. There are no separate systems of Advanced Registry as we have here. All cows in a herd are tested.

In Denmark there is now a total of approximately 1,275,000 cows in milk. In 1926 more than one-fourth of all the cows in Denmark were under control in cow testing associations, while in the dairy sections this runs as high as 50 per cent. This would give, allowing one calf per cow per year and 50 per cent of these bulls, approximately 150,000 bull calves each year from tested dams. There are a total of 63,000 bulls over one year of age in service in Denmark. Allowing the use of a bull for four years there is an estimated bull replacement each year of some 15,000. With the 150,000 bull calves born each year from tested dams, nine bull calves from every ten can be discarded each year and still keep every breeding bull in Denmark a bull from a tested and selected dam. Contrast this with the herd sire

How Testing Built A Good Herd

"If They Put Too Much Feed on Their Backs, I Sent Them to the Butcher," Said This Successful Minnesota Dairyman

THE first time we saw Wallie Anderson's name was in the Minnesota annual cow testing association report covering the results of the several associations for 1924. This report said that his dairy herd consisting of 27 grade and registered Holsteins averaged 452.9 lbs. fat. From this we decided this man Anderson was worth seeing. In order to be doubly assured that Anderson's reputation as a good farmer and community citizen was in keeping with the fine record made by his cows, we wrote County Agent L. E. McMillan, whom we knew, and asked him to confirm what we had reason to believe by reading between the lines of the cow testing association report. We find in our letter to him the following: "We hope you realize the necessity of our confining stories of this character to men who have made what success they have made out of their own skill, thrift, and industry in managing their dairy farms."

WALLIE ANDERSON AND SON, LEWIS, WHO, WITH ONE HIRED MAN, DO THE WORK ON THIS FARM

THE ANDERSON HERD THAT AVERAGED 452 LBS. OF FAT

McMillan's reply convinced us more than ever that we ought to see Anderson.

The first time we saw the man was on July 20, 1926. He was riding a binder around a 20-acre field of wheat. It was about ten o'clock in the forenoon. The sky was cloudless; the sun beat down fiercely, untempered. By noon corn here and there began to curl. In the afternoon a near neighbor took his horses off the binder to the shade. It was a scorching hot day.

A short lane leads back to the Anderson farmstead. As we, McMillan and the writer, drove in, we noticed a native pasture on the left. It was bare, burned to the grass roots; on the right was a field of alfalfa standing erect, beating back the scorching sun, challenging some pigs to help themselves.

Mrs. Anderson told us where to find her husband in the harvest field. Before going, she told us the hot, dry weather had put them hard up against it for cow feed. The pastures were all spent and they were forced to feed a full ration of silage and grain.

The Andersons were born and reared within five miles of the farm they now own. It is a quarter section of level land, well improved, with a public road on three sides and a private one on the fourth side. Mr. Anderson has few fence disputes. They have lived on this farm for twenty years, the first twelve of which they paid rent. In addition to their own farm, they rent and operate 160 acres about a mile away.

One tractor and six horses furnish the power to operate this half section of land. That a large portion of it is under cultivation is shown by the fact that nearly 10,000 bushels of grain are produced annually. The factor representing crop acres per unit of horse power is unusually high.

Man power is supplied by Mr. Anderson, his son, Lewis, and one hired man. Anyone who knows anything at all about the amount of work to be done on a dairy farm knows that man labor is used efficiently on the Anderson farm.

Woman power is supplied by Mrs. Anderson, but the men folk help her. Mr. Anderson, recognizing the advantages of labor saving equipment for his work, has provided equipment that make his wife's work easier. Even though the Andersons are well supplied with labor saving equipment, we do not want to create the impression that they are on an 8-hour day. They are all busy and as Sam Salt of the comic strip says, "You may lay to that."

MRS. ANDERSON CALLS HER FLOCK OUT FROM THE SHADE TO HAVE A PICTURE TAKEN

When the Andersons moved on this farm twenty years ago, they brought with them a grade Holstein cow—a good milk cow. This cow dropped a bull calf which was later used for a year as a herd sire. Mr. Anderson bought his first pure-bred Holstein bull in 1913 for $65. It was two weeks old and he hauled it home in the back of his auto.

A thing that had considerable influence in ing the Andersons to make dairying their m farm enterprise was a severe hailstorm bac 1914. This storm came in June and it was too late to replant for a crop of corn and grain. The second crop clover came on in a dance that fall and it was this clover hay fe cows that enabled them to pay their rent and essary living expenses. They decided that if were good property in emergencies, they good at other times as well.

The herd was gradually built up by buying looking grade Holstein cows at sales. Right Mr. Anderson played a master stroke that men might well heed. He did not depend on looks of these cows to make money. For a nu of years every cow he bought was subjected production test. Samples of milk from each were tested for fat by the local buttermaker they put too much feed on their backs, he them. In other words, he decided that the kind of cows he could afford to keep were whose greatest asset was production and not or or conformation.

After a time he began replacing grades pure-breds but he required his pure-breds measure up to the same production standard required of grades. A pure-bred cow had to a place in his barn by performance at the rather than on the recorded history of ancestors.

The results of this kind of herd building ar teresting. With this kind of management, Anderson herd of 27 cows averaged to pro 452.9 lbs. fat the first year they were in cow ing association work. This is a remarkable re when the number of cows and the fact part of them were grades are considered.

Mr. Anderson believes in cow testing ciation work but at the same time he that any man who really wants to improve production of his herd can easily do so out membership in an association. We not know what the average herd produc was ten years ago. We have some reaso believe that the production has been dou in ten years' time. Mr. Anderson did without belonging to a cow testing ass tion and no one herd sire has left an standing number of daughters compared the production of their dams. In fact, wh pure-bred bull gets up against the use of Babcock test and milk scale herd for ten years, he's go be some bull to make owner know his regi tion papers are w something.

Anderson is a good er. He says that man uses the teste milk scale, he must also learn how to swing feed basket often and with the right contents winter he feeds silage, fodder, clover or al hay supplemented with a mixture of ground oats, barley, bran, and linseed meal. In the mer he continues to feed some grain to ce

As The World Shrinks Does Our Vision Widen

H. L. Russell

INTERNATIONAL trade has grown apace with the annihilation of time and distance through the improvement in communication. The more we see and know of the products of other lands, the more we want to lay them under tribute to serve our needs. A generation ago the frugal breakfast our forefathers consisted of home-grown prodts with the exception of coffee and its sweetng. Now California, Florida, or Honduras ust supply our breakfast tables with fruit, and r cereal must be prepared at agara Falls, Battle Creek, or some distant state.

It is this exchange in wants at is the basis of internationtrade and consequent relanships. Britain cannot conue to take our cotton unless buy some of her Scotch eeds and Manchester weaves. uth America needs our steel t she has to pay for it in fee and fertilizer. Japan d China furnish us with the w silk from which is fashied those lustrous fabrics at so delight the eye. Once were clad in homespun. w the world is ransacked r the most delicate of fabrics meet the demand of modern gue. We pay for these silks d satins, for the fine weaves, r the tea, the coffee, and the ices of the Orient, in automobiles, in sewing machines, cash registers, and ner devices of Yankee ingenuity, in gasoline d cotton—in a myriad of things which they have rned to like.

If We Would Sell, We Must Buy

Trade cannot be all one-sided. Trade is like soal intercourse in life; one cannot always get and t give. You cannot indefinitely accept invitans without issuing some in return. You cannot l a nation or a country continuously without in me way making it possible for them to sell you mething. What we can best sell is that which can best produce. That which we can best proce is that which we can most economically grow make.

In the production of any commodity considera-n necessarily has to be given not only to the raw aterial from which the article is made but labor d other expenses that enter into its manufacture. me nations are preeminently favored in the mat-r of low costs of production. Perchance through abundance of natural resources, or through me especially favorable condition as low cost of bor, they are unusually well suited to compete th the rest of the world. It seems strange that ese natural advantages are not recognized and ilized more than they are. For a surplus-produc-g nation it is imperative that such conditions be preciated. Such a nation may go too far in atmpting to grow and produce everything it uses. lf-sufficiency is a laudable ambition, but it lim-s necessarily the outlook and aspirations of a na-n as it does an individual. Its outlook is toward e past rather than the future. Such a position llowed to its logical outcome is an eighteenth, not twentieth, century viewpoint. In these days when ne and space have been almost annihilated, a w attitude of mind is needed if we expect to be le to do business with the rest of the world.

In a trip last year to the Orient and the Australian continent I had an excellent chance to study me of the methods a nation finds that it must adopt when once it attempts to place itself on a level that is different from the rest of the world.

Australia is a country that is dominantly agricultural in its economic output and is likely to remain so until increase in population is much more marked than now. Most of the six million population, even though over one-half of them live in cities rather than on the broad acres of this island continent that is as large as continental United States, derive their living indirectly at least from the land and its products.

Australia's agricultural surplus cannot be consumed at home. It must go abroad. In the last eight years 42 per cent of the products of her farms have been exported, mainly to the home land of Britain. With wheat and wool the island continent is in a position to match anyone. Cheap land and extensive use of labor-saving machinery produce cheap wheat. While the high cost of gasoline and oil limit the use of automotive power to a much greater extent than here in America, the abundant supply of horse power makes possible a wide extension in the use of lands. Moreover, the correlation of wheat culture and wool growing aids in the retention of fertility and improved yields. Instead of growing wheat year after year as with us, or at most summer fallowing for a season to permit of the accumulation of moisture in the soil, the dry belt farms of Western Australia, which are undoubtedly going to assume constantly increasing importance in the wheat program of the Commonwealth, follow a rotation in which sheep utilize the land for one year out of three. By top-dressing the land with commercial fertilizer (90 pounds of superphosphates to the acre), an excellent crop of grain is assured. When the grain crop is removed, sheep are turned into the long stubble, as the harvesting process strips off only the heads of the grain. With this application of fertilizer, weed growth is facilitated as an aftermath, but on this stubble 250 sheep to the half section of land can be readily maintained. Practically a wool clip is produced at a minimum cost, the fertility of the land kept up, and the offal cleaned up by the use of live stock. The following season fallowing is practiced to conserve moisture. In a country where the rainfall is only about ten inches a year it needs two seasons' precipitation to produce a crop of wheat.

With low freight rates by water, distance is wellnigh annihilated. Even though the surplus production is disposed of in the far distant British market, Australia can hold her own with wool and wheat by reason of relatively low cost of production. Not so with the newer and less developed agricultural industries, such as sugar, rice, cotton, flax, tobacco, and fruits. Here the government has sought grower support by the allowance of a bonus on all of the crop exported if it can be shown that only *white* labor is employed in its production. The situation is justified on the "white Australia" policy, which maintains that the country at all hazards shall be kept wholly white. Under no condition will an alien race of any other color be introduced even for menial labor.

With a recently introduced crop such as rice that is grown on the irrigated lands, the bounty was applied not merely to the crop exported, but to the entire production, providing the growers would

(Continued on page 1216)

TEN THOUSAND TONS OF WHEAT AT A SINGLE COUNTRY SHIPPING STATION

With cheap land and extensive use of labor-saving machinery both for planting and harvesting, Australia is in a position to hold her own in the wheat markets of the world. With her limited population she is only able to consume about one bushel out of every five or six which she raises. At present, Eastern Australia produces the bulk of the crop, but the rapid expansion of wheat culture, in regions of low rainfall, by summer fallowing the soil bids fair to expand production in large measure. In this dry belt elevators are not even needed for storage pending shipment.

SUGAR CANE, TEN MONTHS OLD, FROM NORTH QUEENSLAND

Australia can grow sugar cane readily in her northern warmer sections as is shown from this ten months' old crop. She insists, however, in growing it wholly by "white labor," which entails such a cost that heavy export subsidies are paid to producers to enable them to compete at all in the world's markets. Last year nearly $3,000,000 were expended in export bounties to enable the surplus production to be sold abroad. In spite of this tax which is necessarily heavy on the limited population of this country, popular sentiment is universally opposed to the introduction of any alien races of color.

Creed of a Dairy Farmer

I believe in myself because without this faith I cannot hope to succeed.

I believe in my wife and family because they are my choicest possessions.

I believe in the home because it is the foundation of our nation.

I believe in 4-H club work because it develops the boys and girls who are the citizens of to-morrow.

I believe in the dairy cow because she is the chief sustaining force of the human race.

I believe in treating the cow kindly because she is a mother.

I believe in the use of genuine dairy products in my home because of their unusual food value and because it shows faith in my own product.

I believe in dairy farming because diversification helps maintain the productivity of my farm and protects my sources of income.

I believe in the use of a pure-bred sire from proven ancestry because he can increase the value and production of my herd.

I believe in the herd improvement association because it finds the boarder cows and helps me make more money from my dairy.

I believe in the tuberculin test for my dairy herd because it protects me against losses and safeguards human life.

I believe in properly housing my live stock because it pays dividends in comfort, satisfaction, and labor savings.

I believe in the future prosperity of the dairy industry because it supplies a basic food, and because it is the greatest branch of agriculture.

I believe in feeding good rations because I cannot expect to get more out of my herd than I put into it.

I believe in cooperation, because man should not live for himself alone.

I believe in organization because it is a logical and profitable outgrowth of true cooperation.

I believe in vaccination because it protects my hogs from cholera.

I believe in the use of machinery because it takes drudgery out of work and makes it a pleasure.

I believe in farm records because farming is a business.

I believe in studying my business because knowledge brings greater satisfaction, more enjoyment, and greater profits.

I believe in the legume, especially alfalfa, because it is an excellent feed, a good milk maker, and replenishes the soil upon which it is grown.

I believe in fertilizing my fields because the soil can yield in abundance only in accordance with its state of fertility.

I believe in crop rotation because it protects against insect pests, weeds, and plant diseases, and helps maintain soil fertility.

I believe in paint because it lengthens the life of my buildings and machinery, and makes their appearance more attractive.

I believe in the use of electricity because it is a servant ready to work day and night, takes no vacations, and the harder it works the less it costs.

I believe in standing squarely on my own feet and accepting responsibility for my own acts because this is the only real way to succeed.

Hunter of Kewaunee

An Account of an Exciting Encounter With a Wildcat

RANSOM A. MOORE

YING nearly in the center of Kewaunee County was a large tract of waste land, called the Dikeman Swamp, some three miles wide and six miles long. The major portion of this swamp was scrub cedar which grew so thick that one could scarcely penetrate it.

ıe catamount had practically taken possession ıis swamp, and lived quite largely upon par- ges, rabbits, and deer, h were very abundant. high land around it soon me quite thickly settled. wildcats became so nu- ous that they came out he swamps at night and ed the settlement, killing es, sheep, chickens, and hing they could lay their s upon. The settlers me very much alarmed did not dare go near swamp. The county r d offered substantial ıties upon the wildcats the state also gave a est bounty. In spite of inducement, people were id to go into the swamp r them.

ecause I was brought up ınter and trapper, I felt r bound to help clean the wildcats, as I had e a rather complete y of these animals. While y commonly were wn as catamounts, yet word "catamount" more erly applies to the pan- . In the fur trade these nals are known as the cat. While trailing deer through the snow, I n found that one of these catamounts had come n the fresh trail. After following the deer for a le, the cat would leave the track and make a le sufficiently far and cautiously enough so as not to attract the attention of the deer. After getting around in the direction in which the deer was feeding, he would go up a tree on the opposite side from the deer and get away up on some protruding limb.

When the deer got within fifty or seventy-five feet of the catamount he made a desperate spring upon the deer, nearly always striking just over the front shoulders. Immediately those great claws went into the underside of the deer's neck, and the long, sharp, lancelike teeth penetrated the top of the neck, practically paralyzing the deer. The shock of striking practically always carries the deer to the ground, and while I have observed dozens of instances of this kind I have never known the largest deer to get more than a few feet from where he was struck down.

The cat feeds upon the deer several days. Common wildcats, smelling the deer, also come to feed. When finding deer thus killed, it was my practice to set traps near the carcass.

I repeatedly told my father that in the head of the swamp I had discovered tracks twice as large as any I had ever seen before, and that these must be lynx cats. It was my first year teaching school in the home district, and I was planning for a favorable Saturday to have a day's hunt where I had discovered those enormous tracks, about six miles from home.

One Friday night I made arrangements for the trip. My hound was in excellent shape, not having hunted for several days, and I planned the trip cautiously. While my father seemed to dislike to see me go after these savage animals, yet he was aware that I handled a rifle perfectly and went properly prepared with knife and hatchet to protect myself in close quarters. I usually hunted the lynx cat with a .44 Ballard rifle, but something occurred which changed my plans.

The night was clear until about three o'clock when it began to snow heavily. By daylight there seemed to be at least six inches on the ground. I felt that I could not keep the sights of my rifle open going through the snow-laden cedars. Furthermore, I knew if I got a shot at all, it would be only a few feet away, as the wildcat does not like to tree when there is snow in the trees.

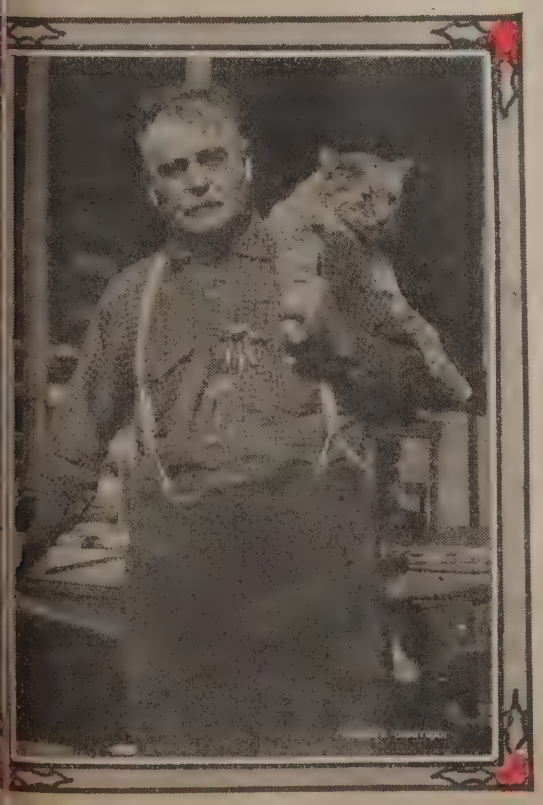
I had an excellent new double barrel shotgun, and I felt by loading it quite heavily with buckshot it would be just as deadly at close range as the rifle. So at the last minute I hung up my rifle and took the shotgun. I started early with my hound, and after I got about a mile or two, it began to clear off somewhat in the Northwest. It was quite cold, and before I reached the hunting grounds the stars were out, and everything was crisp with scarcely a breath of wind blowing.

I went into the swamp, just about sunrise, on an old logging trail which was grown up to brush but afforded me a fine opportunity to get through without being covered by snow from the cedars. The swamp was about a mile wide at this particular point, and I had not gone more than a quarter of a mile before I discovered that two large catamounts had come out from the cedars and followed the old logging road for a distance. I saw at once by the immense footprints that these were the animals I was after. Their tracks were perfectly fresh, as it had stopped snowing only about an hour before.

My hound immediately showed signs of nervousness and an earnest desire to have me take off the collar. However, in hunting cats it is desirable to get as close to the cat as possible before letting the hound loose. By doing this, usually the cats immediately run up a tree or make a few short circles to find out just what is following them. If the hunter is near at hand, he has an opportunity to get a shot while the animal is treed. If the hound starts barking too far away, the cat makes a circle and strikes out on a long trip.

I proceeded cautiously after the cats left the road, but soon found it an impossibility to keep my gun dry. We did not have breech loading shotguns at that time, and had to depend upon the ordinary cap lock muzzle loading gun. I tried to keep the locks of the gun under my hunting blouse, but found that in going through the dense cedar growth, the snow fell down upon me to such an extent that it moistened the tubes and locks of the gun.

However, after going into the swamp forty or fifty rods, my hound began to stop, always a sign that we were near the quarry. She uttered very low whines and would not move even though I pulled on the chain. When I patted her she would move along, only to stop again after going a few



Author Kills Another Lynx With Hunting Knife

Lake Hilbert, Hunting Camp, Northern Wisconsin, Oct. 24, 1927.

HOARD'S DAIRYMAN:—It seems strange that after 42 years I should again get mixed up in a lynx cat encounter. Several farmers around here have had sheep and calves killed recently. They wanted me, a hunter, to try to solve the mystery. They thought that a bear was doing the killing, but upon looking things over carefully I felt it was the work of the deadly lynx cat. I set out traps and, strange to say, a small one, which I least expected to do the work, got him. I did not chain this trap solidly, for the cat would have smashed it in trying to escape. Instead, I cut a small sapling to which I attached the trap. I attended to the traps regularly for three days without success. On going to this particular trap this morning, I followed the accustomed trail. The cat had been caught by one toe of the hind foot during the night and had carried the trap along the trail on which I was approaching. The brute lay crouching beside the path. I was wholly unsuspicious of danger, not even having a gun with me. However, I always carry my hunting knife for quick action. The brute jumped, but I struck a blow with the heavy cane I was carrying, warding him off. I then closed in and as he sprang back and made the final leap, I drove the hunting knife into his neck. Thus ended the struggle. My clothing was somewhat torn and I had one cheek slashed. The lynx cat drew first blood, all right.

R. A. MOORE.

P. S.—A fourteen-year-old neighbor boy had been staying with me nights. He came almost a mile through the woods every evening after dark to bring me milk. He had been very courageous but when he saw the lynx cat that I had killed and the scratch on my cheek, he positively refused to come alone but had his brother drive him up to the cabin thereafter.

he hunter of Kewaunee and his kill; note the length of the and the scratch on Professor Moore's right cheek.

A close-up of Moore's "last wild cat" which he killed with his hunting knife October 24, 1927.

feet. I knew that the animals were near, so I unbuckled the collar and let her go.

She went off like a bullet. In a few moments I heard her barking sharply. I knew at once that she had started the animals because it was the sharp, quick bark of hot pursuit. I rushed forward to get as near to the hound as possible and came out of the dense cedars to a little black ash opening. I soon saw one of the largest catamounts that I had ever witnessed plunge out of the cedars.

If I had had my rifle, I would have killed the animal then and there, but it was entirely out of range of a shotgun, so I made no attempt to shoot. As the cat plunged into the swamp on the opposite side of the black ash swale, the dog came out into the open and started to run across. Just then the cat made a short swing in the heavy undergrowth and came out again. I saw at once that the cat was curious to know what was following her.

The dog, intent upon running down the cat, did not notice the animal that had come out of the swamp on the other end and was going back again two or three rods from the trail on which she went down. However, the cat was entirely out of range and again I could not shoot, but blamed myself for not taking my rifle.

The dog, not expecting this quick turnabout of the cat, overran the track and it took four or five minutes before she got straightened out, but then she came tearing out of the cedars down the opening and into the dense woods again. I was expecting that the cat would make another circle, but not so. The hound took a bee line toward the end of the swamp about two miles distant.

I followed along the trail and finally wandered off into a larger growth of cedars where I came upon an old deer trail. I had run across this trail a few years before, and knew that it continued to the head of the swamp, which ended at the Scarboro Creek. The deer had used this trail so much that it seemed almost like a path through a dense forest. I followed for a short distance and found a large cedar that leaned over the trail. The top limbs had caught the snow so that the large root protruding near the ground made a comfortable seat free from snow. The hound had already gone out of hearing, and there was nothing that I could do but wait.

I concluded that the catamounts would follow the swamp as far as possible, but wouldn't cross the creek because it had not yet frozen over. I felt that there was some possibility that when this animal turned to go back towards the center of the swamp it would get on this old deer trail where it was cleaner running and the snow would not drop into its fur.

I remember distinctly the exact situation. It was one of those quiet, cold mornings; the stillness of the air was almost intense, leaving such positive quietude that sounds could be heard at a great distance. I must have sat on my seat at least a half hour when all at once I seemed to hear my hound yelp away down at the head of the swamp. I listened intently because I was not positive.

Two or three minutes later I heard the yelp distinctly and knew that the hound was coming toward me. From the rapid yelping I knew that the catamount was being pursued by of the swiftest hounds that we ever owned. It was also evident my conjecture about the animal's ting on this trail was correct, as sound indicated they were coming rectly toward me. I hadn't long wait before, looking down the trai saw the big catamount coming a swift trot.

Being perfectly acquainted hunting bears and other ferocious imals, I did not seem to be exci but calm and decisive like one sho be under such conditions. My pl were to let the animal get within feet of me, then fire the first shot, if the animal was only wounded have the other barrel in reserve. plans would have worked out all ri had it not been for a mishap.

Before the animal came in sigh got off the root and stood in the ter of the trail with gun ready action. As the animal came wit the given distance, I fired. With great howl the animal bounded into the cedars from the center the trail but fell down from snow-covered branches. I noticed flashing eyes of the animal, and didn't seem to take it a quarter second to make up its mind what do. With one leap it cleared ab twenty feet of space toward me.

As the animal struck the groun pulled the trigger. But the cap wet and did not explode. The ani made another leap and would h come directly into my face except the fact that I had turned the grabbing the end of the gun near muzzle with both hands. I struck catamount when it was no more t three feet from me. The force of blow broke the direction of animal.

As the animal passed, one of huge paws went into my face, digg a claw into my upper lip. This not tear out readily, and swung b the animal and myself around. sharp claw cut through my lip lik knife, and the animal dropped two or three feet from where I st The locks, stock, and guards of gun went scattering off into the ce swamp, and I was left with noth but the two empty barrels.

As the animal crouched to make spring, I struck him a sledge-ham blow which caught him in the cer of the head just as he was coming The force of the blow was suffic to crush his skull, and the animal quivering at my feet.

The hound soon came up, too lat be in at the killing, but overjoyed t we had got this monstrous cat. On count of the smoothness and fr ness of the snow, I was quite succ ful in finding the locks and gua that had been dashed from my gun the first blow, and I was soon re for the home trip.

The dog, after a few seconds, w off after the other catamount, and or three times ran it within a few of me, but my gun being broke was unable to do any shooting. finally had to grab the dog to get away from the track. We started home and reached there some t during the night with a firm de mination never again to venture f after a catamount with a shotgun

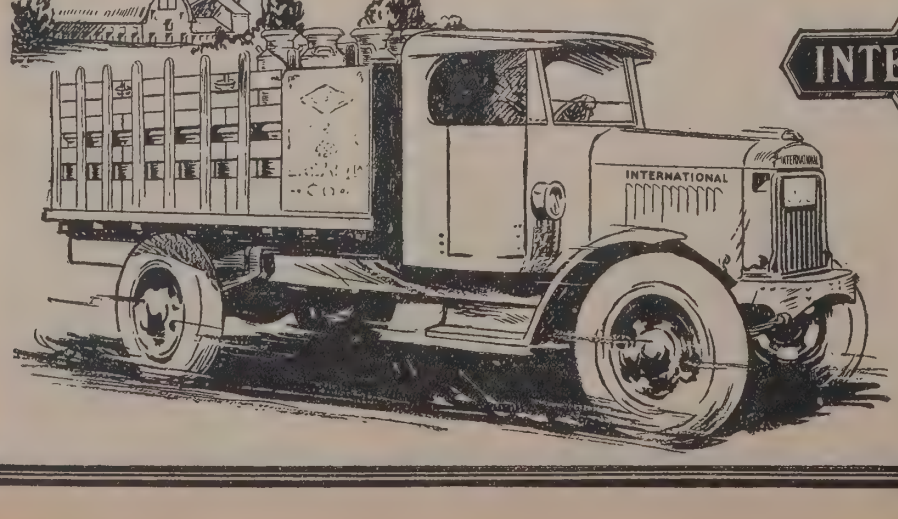
A HANDSOME Speed Truck, ideal for a great variety of farm loads. International Harvester makes eight distinct Speed Truck models. For 1¼, 1½, and 2-ton loads and with 4 or 6-cylinder engine. Express or stake body, stock rack, grain tank, or any other type of body provided for any size truck.

Speed Truck or Heavy-Duty —the Farmer Sticks to INTERNATIONAL



It is no accident that farmers are relying on International Trucks in the process of bringing farm hauling up on the plane with tractor farming and automobiling.

International Harvester equipment has served them in every farming operation for so many years. International Harvester tractors have given them the standard farm power. And they have benefited by the intimate contact with International Harvester service, close by, everywhere in the land.

Most important, they have preferred International Trucks for what they are—fine, sturdy trucks to be proud of, trucks sure to render many years of faithful farm hauling, ready for field and road, for heaviest going. They know that Internationals have been serving tens of thousands of owners in city and town and country, for nearly a quarter-century. And they know of the quality of International service rendered by 136 Company-owned branches.

Speed up your hauling in speed, quality, and efficiency. Own an International—the sizes run all the way from the ¾-ton "Special Delivery" to the 5-ton Heavy-Duty truck. Let a good-looking International save your time for profitable work. We will mail you an International truck folder on request.

INTERNATIONAL HARVESTER COMPANY
606 So. Michigan Ave. OF AMERICA (Incorporated) Chicago, Illinois

INTERNATIONAL

One of the Heavy-Duty Internationals with a day's dairy harvest. The Heavy Duties are of 2½, 3½, and 5-ton capacities.

Another 1000-lb. Fat Producer

The 116th Holstein cow to proc in excess of 1000 lbs. butterfat i year is Dutchland Creamelle M Girl, a 4-year-old owned by Dutchl Farm, Massachusetts. Her record, cently finished, is 26,842.2 lbs. m 1,015.37 lbs. fat (1,269.21 lbs. butt

Uncle Ab says it takes a headt plan ahead.

Dairy Herd Improvement Associations

The Cow That Makes the Money

HOARD'S DAIRYMAN:—The follow- table gives the results of one d in a year of testing in the Long airie Association of Minnesota:

of s	Lbs. fat	Value of product*	Feed cost	Value above feed cost
	356	$196	$58	$138
	340	187	46	141
	329	181	52	129
	326	179	45	134
	303	167	50	117
	288	158	42	116
	260	143	50	93
	235	129	39	90
	226	124	38	86
	221	122	40	82
	126	69	34	35
	274	$151	$45	$106

Fat valued at 55 cents a pound.

The high cow in this herd returned ir times as much profit as the low v. If we can judge the value of se cows by the profits returned, en the high cow is worth just that ny times more than the low pro- cer. After all, this is the only true y of valuing a cow because a dai- man is in the business for a profit d not for his health.

Placing a value of $50 upon the vest producer, which is consider- ly lower than prices paid for sim- r cows at sales, and judging their lue according to profits returned, 2 would be worth $221. In other rds, her profit above feed cost was ual to what her owner would have ceived in interest on a mortgage of 763 bearing 8% interest.

There is a profit in cows produc- g 300 lbs. fat or better a year. Every iryman should make this his goal d constantly practice the command- ent of the successful dairymen— ed, Weed, Breed, and Advertise.

B. J. ROSENQUIST, Tester.

Grooming Cows

HOARD'S DAIRYMAN:—We have not oved by association records in the enry County Association of Illi- is that grooming increases milk eld, but we have proved that it im- oves the quality of milk. Some men ink it foolish to groom cows and t they wouldn't let a horse leave e stable without being groomed. he cow produces human food and in any cases for consumption with- t any care other than straining, d straining is a poor means, at the st, to remove dirt from milk. It is r better to keep the dirt out of the ilk by careful care of the cows d utensils.

One member said, "I do not have me to groom my cows," but I no- ed he had time to groom his horses at were not working. Another ember said, "Grooming puts me d my cows on a friendly basis." nother member, "Any man who has itiative enough to own a herd of ws should have enough pride in s herd to groom his cows."

I find that milk producers who are tailers of their own product strive produce a clean milk. They have und it pays to groom cows.

To induce men to produce a clean- product, one distributor of milk as put up a chart that can be seen adily by all, with each man's mple of a filter showing amount of rt taken from his milk. These sam- ples are arranged according to clean- liness. I have heard some producers say they were going to be the first on the chart. It is a fine method as it involves the spirit of competition. Another creamery pays a two-cent premium per pound fat for the clean- er cream.

Grooming cows surely pays from the standpoint of quality alone.

JESSE L. BARNES, Tester.

An Ohio Record

Eight Holstein cows in the herd of Brainard A. Ryburn of Ohio made, at three years of age, an average pro- duction of 11,837 lbs. milk containing 426 lbs. fat. During this twelve months' period of the Clark County Cow Testing Association the cows av- eraged 10 months in milk and con- sumed in addition to 214 days of pas- ture, an average of 1510 lbs. hay, 6,790 lbs. silage, and 3,384 lbs. grain. The total feed cost was $98, and the value of the product at $2.12 a hun- dred for 4 per cent milk was $232, leaving a return above feed cost of $134 per cow.

Lost! $78.00 A Year By Poor Separators —De Laval Proved It!

IN ORDER to show exactly how much money is being lost by poor separators De Laval Agents in 17 states during the past year held hundreds of public tests, in which the skim-milk from some separator in each community was run through a new De Laval and separated again.

In all these tests De Laval Separators never failed to recover butter-fat from such skim-milk. The butter-fat recovered in this way was immediately weighed and tested at the local creamery or cream station, and varied in value from a few cents to over a dollar.

The average results from all the tests showed that the separators from which De Lavals skimmed the skim-milk were losing butter-fat at the rate of $78.00 a year.

50,000 People Saw These Tests

More than 50,000 people attended these demonstrations and many of them were amazed at the separating losses revealed and asked for tests to be made on their own separators.

In view of the fact that no effort was made to secure skim-milk from the poorest separator in each community, and that the tests were conducted under the observation of disinterested people entirely in the open and above board, they reveal a general condition.

It has been conservatively estimated that 25% of all separators in use today are wasting large amounts of butter-fat—enough to pay for a new De Laval in a short time. Is your separator in this class? To make sure it isn't, try a new De Laval.

Trade In Your Old Separator on A New De Laval

The new De Lavals are the best separators ever made—they skim cleaner, run easier, are more convenient to operate and last longer than any others. They have many new features you will appreciate. Liberal trade allowances on old separators of any age or make made on new De Lavals, which are also sold on easy terms or installments. See your De Laval Agent or send coupon for full information.

EDITORIAL COMMENT

We extend to our readers the season's greetings—a Merry Christmas and a Happy and Prosperous New Year.

Why do some dairymen succeed and others fail? There are many reasons, among which we offer one as being of basic importance. Success is the result of ability and desire to recognize and make use of helpful information; failure is the result of inability or lack of desire to discover and use the known facts of good dairy husbandry. A study of ourselves is, therefore, a very important part of getting the greatest return from a given amount of feed, labor, and other investments and expenditures.

SALT AND WATER

Salt and water are both essential to profitable milk production. Aside from air, they are the cheapest products consumed by the cow, and it is rather difficult to understand why so many cow owners do not provide their herds with all the salt and water that they require.

At one time it was thought salt was not essential, but an extended experiment demonstrated that a cow needs salt quite as much as she needs other kinds of feeds. The quantity that a cow requires daily depends upon her size and the quantity of milk she produces. One to two ounces per cow daily is considered adequate. It is the practice of some feeders to mix enough salt in the grain portion of the ration so that each animal gets one ounce daily, and then provision is made where they can eat as much more salt as they desire. This we consider a very satisfactory way of salting cows.

Many instances could be cited where cows have not been given an adequate supply of water, for when they were given an opportunity to drink all they desired, their milk production increased 15 per cent or more. The ideal way to provide both salt and water is to keep them before the cow all the time. That cows drink after they have finished eating their grain, is pretty good evidence that this is a good time to water cows. At any rate, whatever system is used for providing salt and water for cows, let it be adequate and at no time let the cow be in need of these simple feeds. It is a waste of other feeds if cows are not supplied with sufficient quantities of salt and water.

LOADING THE DICE

A prominent breeder of dairy cattle writes in part as follows: "I have read with a great deal of interest your editorial of November 10 on the question of the Holstein Association adopting the Herd Test Plan. The one great difficulty with the Herd Improvement Plan is to keep in everybody's mind clearly the fact that it is a test of a herd and not an individual test. There is likely to be a constant demand that credit be given to high producing animals on test but the herd record should be featured and, of course, the record of the bulls whose get have shown themselves to be especially high producers. The danger that I see for the herd test is that the large breeders can never, in my opinion, year in and year out, make records comparable with the farmers who have a few registered cows. This will make it very difficult for the big breeder who goes on herd test to compete with another breeder who doesn't go on test.

"In my experience, for a man to go and buy a few high producing cows and breed them to a bull that may be out of a high producing cow or may be a show winner is a good deal like throwing dice. The results may be all the way from 2 to 12. The man who breeds for years and in his breeding operations eliminates all those that fail to meet certain standards gradually gets a modified pair of dice—dice possibly with only 4's, 5's, and 6's—so that when he throws the results will only vary from 8 to 12 instead of from 2 to 12. If any breed can get a large percentage of its breeders to adopt the Herd Test Plan for 15 or 20 years, those breeders will automatically make for themselves a pair of dice that has no low numbers."

This is another way of saying that the breeder who directs himself to the improvement of his herd and eliminates the low producers will establish fixed traits or characteristics in animals that have no low producing characters in their veins. They will reproduce animals of high producing traits. The only way to establish high producing characters is to sell animals of low production to the butcher. The real purpose of the Herd Improvement Plan is to eliminate low producing animals and perpetuate those of high production and in this way establish a high producing herd rather than a medium herd with a few high producers.

By the systematic "spotting out of the low producers," as Professor Anthony puts it in his discussion on our title page this week, we can load our breeding dice so that low production will become unusual and high production prevail more generally. Breeders can make for themselves "a pair of dice that has no low numbers."

FARM CONVENIENCES

It is with considerable satisfaction that we read the recent survey made in Wisconsin as to the extent to which the farm is taking advantage of those things which make farm life more pleasant and attractive. One-fourth of the farm homes in Wisconsin are equipped with furnace heat and power washing machines. One-fifth of these homes have radios and nearly as many are equipped with electric lights.

The study was made by the Wisconsin Crop and Live Stock Reporting Service in co-operation with the rural and state graded schools. Reports were received from nearly six thousand school districts covering a total of 52,757 farms. These reports indicate that 17% of Wisconsin farms are equipped with electric lights; 13% use electric power; 9% receive their electricity from home light plants; and 20% have radio sets. Power washing machines are used in 25% of the farm homes; 24% have furnace heat; 14% have piped running water in the kitchen; 30% have piped running water in the barn; 11% have bath tubs; and 7% have hot running water in the kitchen.

We hope the time is not far distant when even larger use will be made of modern conveniences and labor saving devices on the farm and in the farm home. There is no place where they are more thoroughly appreciated and put to so good use. We are gratified, also, that the industry and opportunity of the Wisconsin dairy farmer are such that they permit of the investment in these things that make for better living and satisfaction on the farm. For the dairy farmer these conveniences lighten his labor and that of his wife to a greater extent than for any other class. They are necessities rather than luxuries.

PROOF WANTED

"The farmer buys in a protected market at a high American price and sells in an open market at a low world's price."

This statement, with variations, is constantly and consistently used by those who argue for so-called farm relief legislation. It appears to be the bone and sinew of their argument, yet we have seen no proof submitted. We hold no brief for the protectionist, nor do we care to enter into this as a political discussion. However, we are interested in the facts.

What does the farmer buy in a protected market that every other person does not buy? With very few exceptions the tools and equipment of farming as a business are all on the free list. The American farmer can buy his mower or other farm business equipment from a foreign manufacturer and he pays no duty. What he does buy in a protected market is what every other man is compelled to buy.

Certainly there is no discrimination against the farm buyer. If anything, there is discrimination against the city buyer. If the consumer pays the tariff duty, as some claim he does, then he pa extra for his butter to the tune of twelve cen a pound as well as extra for most other foo and household articles. He pays duty everything he buys to as large an extent as t farmer, in addition to which he pays a tariff du on the tools and machinery he uses. He is co pelled to a larger extent than the farmer to b in a "protected market."

We ask again: What does the farmer buy in protected market that every other American ci zen does not buy? We have put this same que tion many times to those who have used this a gument, and we have yet to find a man who h given any supporting evidence of his claim. they reply, they avoid the question and mere "holler down the rain barrel" other unsupport statements or generalizations, with the appare intention of distracting attention.

There is some truth in the statement that ce tain farm products, like cotton and wheat, sell the world price in our domestic market. Howeve this does not apply to all farm products, and time goes on the farmer will be more interest than the manufacturer in tariff rates on his pro ucts. Consumers of farm products in the Unit States are increasing very fast, and producers farm products are decreasing. In the not dista future we may see an insistent call from the ci for free trade in food products, and then the ba tle royal will be on.

"He must buy in a protected market" is an o bogey. The facts do not show any discriminati against the farmer. Men who use this kind of a gument should submit proof as well as make mere assertion.

NATIONAL DAIRY COUNCIL

The dairy industry will regret to learn that D C. W. Larson has resigned as chief of the Bure of Dairy Industry. This regret gives place to r joicing, however, when the announcement is a companied by the news that he has been chosen direct the manifold and valuable activities of t National Dairy Council. As chief of the Dai Bureau, Dr. Larson has shown unusual executi ability and has gained the good will and con dence of all phases of the dairy industry. His s lection for his new duties has met with univers approval and should tend to strengthen and a vance the work of the Council.

The small group of men who met a few yea ago and formed the National Dairy Council ha builded better than they knew. They were men vision, yet it is doubtful if they saw then the po sibilities of the organization and what a solid a substantial contribution it would make, not only the dairy industry but to the health of the nati as a whole. Through the wise leadership President Munn, it has functioned exceeding well for the dairy industry, not selfishly but presenting the merits of milk sanely and intel gently in connection with the whole problem health and proper nutrition. In this way it h secured the whole-hearted support and co-oper tion of the medical profession, the health autho ties, the schools, the women's clubs, and, in gen al, all welfare agencies. We do not know of a other case where such universal and genuine c operation has been given to an object which mig be construed as being selfish. However, by its a tions the Council has justified and strengthen this co-operation.

President Munn and his co-workers are to congratulated upon their accomplishments, b even such splendid progress as has already be made is only the forerunner and the promise future benefits to the dairy industry and to t health of the nation. It is therefore with gre pleasure that we learn that President Munn w successful in securing Dr. Larson, sound in jud ment and well trained, to join the Council as directing force. The good work already done is challenge to the future and should lead the dai industry to give the Council its whole-heart support, financially and in every other way.

Moving a Stave Silo

ow would you suggest to move a 10x24 foot d stave silo to a new location about a mile y and without taking it down?
oscow, Idaho. F. O. H.

'e hesitate to advise moving a stave silo with- taking it down. It is very doubtful whether could get it back on the foundation and in i shape without racking it to such an extent it would not stand well. Furthermore, the ense is quite likely to be greater than in tak- the silo down and re-erecting it.

owever, if it is desired to move the silo with- taking it down, very likely the nailing of one- inch strips around the inside of the silo as rior hoops will enable one to handle it without ollapsing. As a matter of safety, these inside den hoops or stays should be placed at the e point that the outside hoops are placed. Af- protecting the silo in this manner and tighten- up the outside hoops, the silo may be tipped on its side and moved on wagons or on a ially built set of runners.

few years ago in discussing this same subject 'isconsin subscriber sent us his experience as ows:

We first tightened the hoops, then raised the with a jack screw and loaded it on two eight- ights. These were fastened solidly by nailing planks inside and outside. The outside planks e notched out some to fit the circle of the and inside plank. The corners were chopped it against the silo. It was then loaded for ing. We placed plank on the ground to move and moved with rollers. Pulling was done a tackle block. When ready to place on wall silo was let down two inches at a time by us- a bar for a lever. The staves were not moved of line in moving."

Carbonaceous Feeds Needed

have sweet clover hay as dry roughage and k beets as succulent roughage. I also have soy s and cottonseed meal is available at low . Will you suggest other feeds needed and e a balanced ration for me?
hitakers, N. C. O. K. T.

he greatest need in this case is for carbona- s concentrates such as corn, hominy feed, bar- oats, grain sorghum, and feeding molasses.

'e suggest the sweet clover hay be fed to the t of appetite along with the stock beets at a of about 4 lbs. daily for each 100 lbs. of live ght. If the hay is somewhat coarse such as to e it more or less unpalatable, one could sprin- it lightly with thinned cane feeding molasses thereby tempt the cows to eat more of it.

his combination of roughage when fed as sug- ed requires a concentrates mixture yielding more than 10 per cent of digestible protein, n fed at a rate of 1 pound for each 3 pounds milk produced. In fact, such a mixture supplies e protein than is actually required according eeding standards. A mixture composed of 200 each of ground corn, hominy feed, ground , bran, 100 lbs. of cane feeding molasses, and lbs. each of cottonseed meal and ground soy s will yield a little over 10 per cent of di- ible protein.

he ration composed of 15 lbs. sweet clover hay, bs. beets, and 10 lbs. of the above mixture sup- s 3 lbs. of digestible protein and 18 lbs. of total stible nutrients. The requirements for a cow ghing 1,000 lbs. producing 30 lbs. of 4 per milk daily are 2.48 lbs. digestible protein and 8 lbs. total digestible nutrients.

Soy Bean Hay and Sheaf Oats

or roughage I have a hay composed of about e-fourths soy beans and one-fourth sudan ss. I also have sheaf or bundle oats, and I have shed oats available. I understand that soy ns are very high in feeding value when cut in bloom and that the U. S. Department of Agri- ure does not recommend the feeding of soy n hay alone on account of this high feeding e, stating that digestive trouble may result. If is true, how would it do to grind the sheaf s, straw, grain and all, and feed this with the bean hay? If I feed the soy bean-sudan hay he only roughage, what is a good grain mixture feed including oats? Give me a grain mixture able for feeding with soy bean hay and ground af oats.
rgyle, Mo. J. B. L.

oy bean hay would probably have a higher feed- value when cut after the pods are well formed, large percentage of the leaves could be saved at that time. Such hay would not be quite as palatable as earlier cut hay and there would be greater difficulty in curing it because the bean pods do not dry out rapidly. The general practice is to cut soy beans for hay when in full bloom or very shortly afterwards just as the pods are forming. When cut at this time, the hay has a feeding analysis very similar to alfalfa hay, and feeding trials indicate it is nearly equal to alfalfa for dairy cows. As a rule, a greater percentage of soy bean hay is refused by cows, owing to the coarse stems, than is true with alfalfa. Nowhere do we know of feeding trials indicating that soy bean hay fed alone causes digestive trouble. The soy bean seed, if fed in large quantities, would likely cause some trouble, and the butterfat from cows so fed would be too soft for good butter.

As a general rule, soy bean hay is combined with silage. Not often does one feed soy bean hay as the only roughage. We would not hesitate to feed it as the only roughage if no other roughages were available to feed with it. A grain mixture suitable for feeding with soy bean hay in which there is some sudan grass could be made of 300 lbs. of ground oats, 300 lbs. of ground corn or ground barley or hominy feed, 200 lbs. bran, 100 lbs. each of linseed meal and cottonseed meal.

There is no objection to grinding the sheaf oats which, together with the soy bean hay, would constitute a good roughage combination. We suggest moistening the roughage, both hay and ground sheaf oats, with thinned feeding molasses to make it more palatable. A suitable grain mixture could be made by adding 100 lbs. of gluten feed to the mixture given above.

Solids in Skimmilk

What is the comparative content of solids in skimmilk from the Jersey, Guernsey, Brown Swiss, Ayrshire, Holstein, and Milking Shorthorn breeds?
Morrill, Neb. C. M. K.

There are no analyses available as to the average composition of skimmilk from milk of the various breeds. Professor Eckles, however, gives in "Dairy Cattle and Milk Production" a table showing the average composition of the whole milk of the several breeds as computed from a large number of records published by experiment stations. We reproduce this table below, adding a column to show the probable composition of the skimmilk resulting from separation:

	Whole milk analyses			
	Fat	Solids not fat	Total solids	Solids in skimmilk*
	%	%	%	%
Holstein	3.45	8.84	12.29	9.2
Shorthorn	3.80	9.05	12.85	9.5
Ayrshire	3.85	9.13	12.98	9.6
Guernsey	4.98	9.72	14.70	10.2
Jersey	5.14	9.76	14.90	10.3

*Estimate based on the assumption that one pound of solids not fat is left in the cream and that 100 pounds of milk will yield 85 pounds of skimmilk.

To provide further data on the relation between the fat content of milk and its content of solids not fat, we have combined 754 analyses of milk reported by the Minnesota and Illinois agricultural experiment stations. We have classified these analyses on the basis of a variation of one-half of one per cent in fat test and then estimated, as previously, the approximate per cent of solids that would be retained in the skimmilk. The results are given in the following table:

Whole milk analyses			
Fat	Solids not fat	Total solids	Solids in skimmilk*
%	%	%	%
3.0	8.2	11.2	8.5
3.5	8.5	12.0	8.8
4.0	8.7	12.7	9.1
4.5	9.0	13.5	9.4
5.0	9.2	14.2	9.7
5.5	9.4	14.9	9.8
6.0	9.5	15.5	10.0

*Estimate based on the assumption that one pound of solids not fat is left in the cream and that 100 pounds of milk will produce 85 pounds of skimmilk.

The above table indicates that as the fat percentage of milk increases the percentage of solids not fat also increases, but not as rapidly or in the same proportion. While these averages indicate a definite relationship between fat and solids not fat, the individual tests show variations from the normal. For instance, 34 analyses of milk testing from 3.75 to 4.20 per cent fat, showed a variation of from 8.3 to 9.9 per cent in solids not fat; and 34 analyses of milk testing from 4.25 to 4.74 per cent fat, showed a range of from 8.9 to 10.1 per cent solids not fat. However, these are the extremes in variation and are not indicative of the general trend of the relationship between fat and solids not fat.

The weather, period of lactation, feed, and other conditions affect the per cent of solids not fat in milk without regard, in many cases, as to their effect on test. For instance, although the casein content of milk increases with advancing lactation as does the fat content, dry pastures and hot weather in late summer tend to decrease the casein content of milk much more than it does the fat content. This is one of the reasons why cheese made at such times leaks fat badly, does not press together well, and does not stand up although behaving perfectly when first made. There is also excessive loss of fat in the whey. "This behavior," say Van Slyke and Price in their new book on cheesemaking, "is due to the abnormal decrease of casein in relation to fat, so that the milk and cheese contain an excess of fat." However, this condition is liable to affect all milk alike, whether from high testing or low testing cows.

While Professor Eckles' report indicates a relatively higher percentage of solids not fat in milk than is given in the succeeding table, the ratio between solids not fat in milk of different tests is about the same. His report indicates that 100 pounds of Holstein skimmilk would contain about 9.2 pounds solids as compared with 10.2 pounds for Guernsey skimmilk, a difference of 1.1 pounds. The succeeding table would indicate that 100 pounds of 3.5 per cent milk would contain 8.8 pounds solids as compared with 9.7 pounds for 5 per cent milk, a difference of 0.9 pound.

While the above discussion has been based largely on the relationship between fat and solids not fat in whole milk, it applies in like measure as to skimmilk. We believe the estimates as to solids in skimmilk from milk of varying tests may be fairly well relied upon. It is possible that the smaller quantity of cream of a given test secured from low testing milk may vary the content of solids in the resulting skimmilk. It would be our opinion, however, that this would not have a material effect.

Getting Ready for Pasture

Anticipating a shortage of pasture next summer, I have limed 10 acres to be seeded to sweet clover in oats. How much pasture may I expect from the sweet clover after the oats are off. About when will it be ready to pasture? About what rate of seeding should I make the oats and sweet clover? If I cannot expect much from this sweet clover the first year, what suggestion have you for supplementing my native pasture and this sweet clover?
Boone, Iowa. C. R. A.

If everything is right, one could begin pasturing the sweet clover approximately the last week in August and continue until the latter part of October. First year sweet clover should not be pastured heavily late in the season unless the acreage and number of live stock are such as to supply considerably more feed than is required. The plants should be allowed some opportunity for growth as long as weather permits.

We have seen splendid pastures from first year seedings of sweet clover in oats, and we have seen no pasture at all. Three factors are largely responsible for success in a venture of this kind. The soil must be sweet, the inoculation must be thorough, and the rainfall after the oats are cut must be ample and timely to give the young, tender plants an opportunity to take full advantage of the remainder of the growing season. When all three are right, there is pasture, and when one or more is not right, there is little or no pasture.

We suggest seeding not more than two bushels of early oats and from 10 to 15 lbs. of scarified, white biennial sweet clover seed per acre. The sweet clover seed should be inoculated with the proper bacterial culture which may be secured from any reliable seed company. Directions for its use accompany the culture.

To supplement the native pasture, we suggest a seeding of sudan grass which will be ready to pasture about six weeks after it is seeded. The time of seeding should, therefore, be gauged according to the anticipated needs for the extra feed. One seeding of sudan could be made at a time when it will supplement the native pasture best, and a later seeding made when it will supplement the new seeding of sweet clover best. The rate of seeding sudan is from 15 to 20 lbs. per acre, seeded broadcast on a seed bed, the surface of which is prepared as for corn.

Subscription Rates

Subscription in United States and Mexico three years for $1.00; single year, thirty-five cents. Canada, three years, $2.50; one year, $1.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $1.00 a year; not in Postal Union $1.50 a year. These rates include postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers who farm with businesslike methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received thirteen days previous to the date of publication. Advertising to be classified or changes in advertising must reach us three weeks previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Larson Joins National Dairy Counci

IN the same sense that Judge Landis is termed the Czar of Baseball and Will Hays the Czar of Motion Pictures, the daily press has published the photograph of C. W. Larson and has designated him as "The Czar of the Four Billion Dollar Dairy Industry."

This is, of course, the kind of publicity the daily press delights in, and it all comes from the fact that on December 1 the National Dairy Council engaged Dr. Larson as director of the work in which it is engaged. Dr. Larson has been Chief of the Bureau of Dairy Industry of the U. S. Department of Agriculture and enjoys the confidence and respect of all departments of the industry. In announcing his selection, M. D. Munn, President of the National Dairy Council, said: "The development of the four billion dollar dairy industry and the growth of the Dairy Council movement made it necessary to increase the executive force of the Council. Dr. Larson will direct the activities of the Council and brings to this organization a unique background of experience and a wide acquaintance with the leaders of the industry."

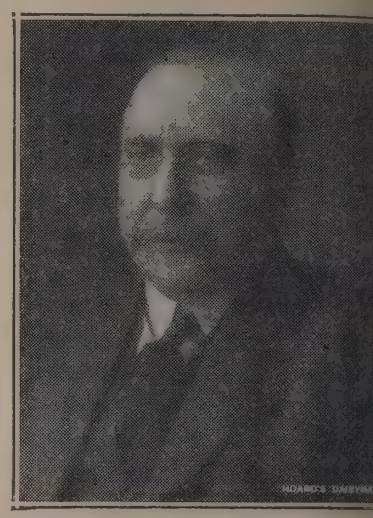
Dr. Larson, a graduate of Iowa State College in 1906, has had a wide experience in practical management of creameries and cheese factories. He was with the dairy department of Pennsylvania State College for ten years, at the head of this department most of that time. After securing his doctor's degree at Columbia University in 1915, Dr. Larson was appointed to the Chair of Agricultural Economics at Columbia University. During the war he was requested by the U. S. Department of Agriculture to come to Washington for special war work, following which he was appointed assistant chief of the dairy division, receiving the appointment of chief of the division in 1921. A Bureau of Dairy Industry was established in 1924 and Dr. Larson has developed the policies and program of work under which this Bureau is expanding.

C. W. LARSON

Mr. Larson has resigned as chief of the U. S. Bureau of Dairy Industry to accept the position of director of the widespread activities of the National Dairy Council in promoting the wider and more general use of dairy products.

The Growth of the Dairy Industry

"With 7 per cent less dairy cows in 1926 than in 1920," said President Munn in his annual address, "we produced 34.7 per cent more milk than in 1920. Think of the influence that has had on the stabilization of agriculture.



"I listened the other day to a discussion about getting relief to the extent of three or four hundred million dollars in one cereal and three or four hundred million dollars in another—a total of somewhat less than a billion dollars, which would completely relieve agricultural distress. Why, through this animal this relief can be secured, the human race much improved, soil fertility much improved, and prosperity on the farm much improved, and it can be done on an easier, more certain, more effective and and more permanent basis, in my judgment, than in any other way.

"We know today that the least important consideration in connection with food is the satisfaction of hunger. We know that the great important question is—What foods will best supply most economically the elements that are necessary to build and sustain the human frame and produce the most efficient form of human beings?

"Of the consumer's dollar, twenty cents went for milk and its products during 1920. Taking the 24.8 per cent increase in consumption of dairy products, we find that the per cent of the consumer's dollar has been raised by practically 4.75 and yet we have not reached anywhere near the amount these dietary scientists are telling us and telling the public should be used of these products to build the best frame and maintain the best mind. They say it should be at least 30 per cent in order to meet the requirements that are necessary. If we reached that point in the next eight years, our supply of dairy products would have to be increased over 45 per cent.

"Here we have not only our desire for increased business, but have the scientific support and statements and backing of dietary scientists as to what we ought to do the interest of the consuming pub We are able to go, not with a sel story to the consuming public, with a story built on a scientific fo dation and supported by the scien world of this country.

"Are we doing what we ought do ourselves in this regard? I hesitatingly say no, we are N Here are thousands upon thousa

M. D. MUNN

Mr. Munn was re-elected president the National Dairy Council and will co tinue active as head of the Council, w its fourteen regional units in strategi locations throughout the country.

of butter manufacturers, thousa upon thousands of milk distribut hundreds of thousands of farmers farmer organizations, and each really in itself a unit. They grouped together in sixteen or e teen national organizations, but th national organizations are not ganized to raise funds to carry this work. That is the business of National Dairy Council.

"How can we get this over to industry? How can we picture this industry the possibilities that ahead of it, the opportunities are coming to it? Why, if I were ing to say that there was any di request that could be made, it wo be: Give us the vision and the po to see and visualize the opportuni and possibilities that lie ahead of If we will only take advantage these opportunities, there is no l to what can be done in expanding industry."

Buttermakers' Short Course

The University of Nebraska announces a short course in buttermaking and creamery management to be held January 9—21st. This course is especially designed to meet the needs of the man engaged in creamery work. The creamery is modern in every way and completely equipped for the various branches of the dairy industry.

The course of instruction will cover testing milk and cream, principles of chemistry and bacteriology applied to creamery practice, grading, neutralizing, pasteurizing, churning, and packing. Lectures on creamery problems, principles of accounting, advertising, marketing, creamery organization, and management, as well as mechanical refrigeration, will be given.

For further information address Department of Dairy Husbandry, University of Nebraska, Lincoln.

Christmas Inspiration

You may be down but you're not out if you have the indomitable spirit of Theodore Notbohm.

Seven years ago this Southern Wisconsin Holstein breeder lost his entire herd of 26 head from tuberculosis, a herd he purchased with the farm in 1912 and in which there had been nothing but pure-breds for 40 years. Today the Maple Lawn Holstein herd numbers about 28 head, nearly all pure-bred and all but one raised on the farm. It has been on the federal accredited list for five years. Mr. Notbohm believes thoroughly in the tuberculin test and would not have an untested animal in his barn.

Four years ago Mr. Notbohm lost his eyesight and has suffered much since. But he does not complain. With the help of his cane and his canine friend, Bob, he gets around alone—milks, runs the separator, curries the horses, and does odd chores. This fall he husked and tied 7 acres of corn alone. In his spare time recently he braided a doormat from corn husks. His wife and his son, Wallace, help run the 95-acre farm and his daughter, Helen, a high school student, is a good "hired hand."

As you step into the milk house and from there into the barn, you note the fresh, clean appearance of the white walls and ceilings. You are informed that the whitewash for this, the poultry and hog houses comes from the carbide gas plant located in the basement of the home. The lime wash taken from this plant is used as a spray for the orchard trees and is occasionally applied as a fertilizer to the fields, helping to make alfalfa grow luxuriantly, a crop which has been a standby on M Lawn Farm for many years.

The home is modern through with running hot and cold wa and furnace heat. There are 29 lamps in the house, yard, and b Mrs. Notbohm cooks with acety gas and is enthusiastic over its There has been a carbide gas plan this place for eighteen years. Notbohm cleans and fills the p himself and thinks that acetylene is a good, economical source of and light.

Theodore Notbohm has serve secretary and manager of the co erative creamery near his home last winter was elected president. is optimistic about the future farming and in his comeback aga two such hard blows—his loss of h and eyesight—there is a real Ch mas inspiration.

Wayside Musings

"The Strength of the Humble and the Weak"

JOSEPH S. MORRIS, WISCONSIN

. . . Be not afraid; for behold, ring you good tidings of great joy ich shall be to all the people." nd this is the sign unto you: Ye all find a babe wrapped in swad- ng clothes, and lying in a man- r."—St. Luke 2:10, 12.

A Christmas Prayer

Ve thank Thee, O God, that the message new hope for the world came to humble n in the line of duty. We thank Thee t that hope and that promise was incar- e in a little child. We are filled with awe the presence of all childhood for we re- mber that in them is the future, and as rejoice and are glad for the birthday of Christ our minds turn naturally to chil- n and we are filled with desire to make m happy, and healthy, and good. We re- n thanks, O God, for the humble men of th, for the men who are eager to see some w good born, for the men who are not amed of hope and faith, even in the midst life's unending round of work. May this a happy Christmas for all and may we do our part toward making a happier rld.

e time draws near the birth of Christ;
The moon is hid, the night is still;
A single church below the hill
pealing, folded in the mist.—TENNYSON.

SO many Christmas days have come and gone that our minds are full of the traditions, the folklore, the customs of many lands and climes. In all that we have in sacred memory there ides a universal desire for peace id good will, and for the dissem- ation of happiness. We are chil- en, all. We long for that mystical mething that shall lift us above the tty, the sordid, the commonplace, id help us to share in the noble, the nerous, and the exceptional.

For a brief span at any rate we bandon ourselves to the spirit of hristmas. And what is the spirit of hristmas but the spirit of good ill, the spirit of good deeds, the irit of sacrificial love—love that oes out of its way to bring smiles id gladness to others. Of course, llowing the thought to its logical nclusion, we shall desire that more this spirit shall abound through- ut the year. Perhaps it is the very act of Christmas that gives us so uch of love and good will and gen- osity throughout the year.

Modern life, the making of a liv- ng, is a more or less stern business; he struggle calls for strength of anhood and womanhood. In the rocess our lives become somewhat alloused; we dare not give way to hat is called "softness" lest we fail the struggle. And yet, beneath he surface of the most mature, the ost matter-of-fact man or woman, here lives another being who is the oy, the girl of dreams and hopes and deals; the boy, the girl of warm eart and abounding faith. Christ- as brings to these the opportunity, or the moment, to live again in all he sweetness and good will of child- ood, and to get a new grip upon faith and confidence in each other. Who can say that we are not the better for Christmas even though it may be true that we do not carry enough of its spirit into all the year?

Man is a poet and a mystic and we do not know him until we know him in his deepest heart, until we know him as he would really be should opportunity be given for the expression of his best and noblest self.

And how the spirit of Christmas serves to drive out enmities, animosities, and lingering hates and wounds. It seems almost a sacrilege to carry these into the warm-hearted Christmastime. Is not the world purer, better, for Christmas that takes away some of the hate and ill will?

I have topped this story with the beautiful text from the gospel of St. Luke. Men were told not to be afraid. Heaven had moved with good tidings of great joy for all the people. It is remarkable how inclusive the message is—"all the people." Never can we have good tidings of great joy that are exclusive and that shut out some and admit others as a chosen few. And how beautiful is the story that there were shepherds abiding in the fields keeping watch over their flocks by night, and that to them, in the line of common, honorable work heaven was to make known its newer and better day. Is it not true that all good tidings of better things come from workers, from those who are busy doing the thing nearest at hand, however much they may project themselves into the future and dream of better things? How much betterment or blessing has ever come to mankind from its idlers, rich or poor?

And then this: "And this is a sign unto you: Ye shall find a babe wrapped in swaddling clothes, and lying in a manger." Here is weakness and humility of station, and yet out of these God is to bless the world.

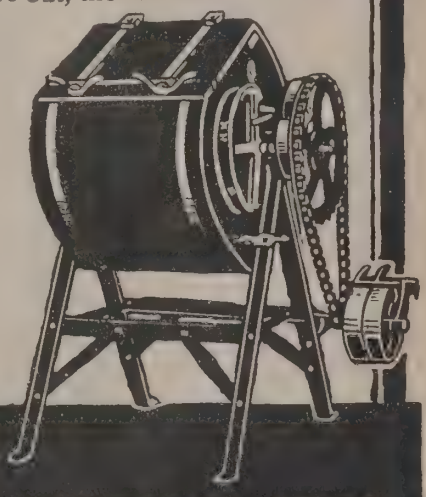
Shall we be wandering far afield if we expand the thought at this time and turn our attention to the babies, the children of the land? Are they not a sign to us of tomorrow? Has it not been true again and again that out of the loins of the common people have sprung earth's great deliverers?

Christmas is essentially a children's holiday. Let it be so. Let us look into the face of happy, hopeful, expectant childhood and know that if there is to be any good in the world when we have grown old with the burden-carrying of the years it must be because we have been faithful to our children and helped them to see the good, the beautiful, and the true.

Let every window in every church everywhere be bright with glowing lights; let every home everywhere put a light in its windows; let every heart everywhere shine with new radiance that the spirit of the Christ Child may find its way throughout the whole world bringing cheer and gladness and better days.

Milkfed Collegians

Agitated statisticians have been onducting nation wide investigations, nostly by means of questionnaires, or the purpose of learning how boot- eg liquor is consumed by college stu- lents. Nothing extraordinary has been revealed—at least nothing un- suspected nor menacing to our na- ional morality. And now, like a bolt rom the blue, comes authentic in- formation to the effect that college oys and girls are milk drinkers.



The California Dairy Council explodes this bomb filled with official statistics. It shows that more milk per capita is sold in Berkeley and Palo Alto than in any other cities in the state. A young woman in charge of the dining rooms at Stanford University strengthens the evidence by a statement that 750 students who eat there consume 200 gallons of milk daily.

Will somebody now conduct a lacteal questionnaire and oblige?—San Francisco Bulletin.

MINNETONNA
HOME BUTTER MAKER

A WONDERFULLY efficient butter making machine built on the same working principles as the machines used in large creameries, differing only in size and price.

It gets all the butterfat out of the cream. It churns rapidly so the butter comes in from one-half to one-fourth of the time. By simply throwing in clean water and giving a few turns, you remove all buttermilk. Instead of working the moisture *out*, the MINNETONNA works the moisture *in*, so necessary to the flavor and the keeping qualities, and giving an "over-run" (of moisture and salt) of from 20 to 25 per cent above butterfat test. Hence *more* and *better* butter.

Churning capacity 3 to 12 gallons. Working capacity 3 to 20 lbs. Larger sizes up to 100 lbs. capacity.

GOOD RATIONS ARE NOT ENOUGH

Important Factors of Successful Dairy Husbandry

IN a previous article under the title of "Fitting the Feeds to the Cow" we discussed simple methods of approximating good rations for cows together with suggestions on feeding. In this article we discuss air, water, minerals, vitamins, herd management, and dairymen.

Air

When a dairyman builds a barn he provides for the storage of roughage and concentrates; he provides a place in front of each cow from which her feed is consumed; he provides a place for the daily collection of the manurial excrement and a carrier for removing it from the barn; he puts in a milking machine by which to remove the milk; and he puts in watering cups or provides a nearby place to drink.

When it comes to air, he too often takes for granted its supply and the removal of the by-products from its use in the cow's body. He cannot see air; he does not feed it in a basket or remove the by-products of its use with a fork or shovel. It is difficult for him to measure with his eye the effects of poor ventilation on the production or health of his herd. And yet a dairy cow inhales about twice as many pounds of air in 24 hours as she takes in feed and drink. She exhales several gallons of moisture daily into the atmosphere of the barn.

Let us not take too much for granted in the supply of air to cows and in the removal from the barn of the by-products of its use.

Water

It is easier to visualize the feeding of water to cows than the feeding of air, yet many do not fully realize the importance of supplying cows with water under conditions that will tempt them to drink all they need.

The quantity of water a cow needs daily depends largely on her size, production, the character of her feed, and on atmospheric conditions. The quantity she will actually consume depends to no little extent on the conditions under which the water is offered.

Cows will consume, as a rule, all the water they need if they are given the opportunity to drink two or more times a day, if the water is tempered to 50 to 70 degrees Fahrenheit, and the water is readily accessible under seasonable conditions.

Minerals

The mineral requirements of dairy cows and the factors which influence the converting of mineral elements into body uses are not fully understood.

How much of mineral substances, which ones to feed, how and when to feed them, are questions that cannot fully be answered. It is important, however, to safeguard the herd from the known effects of mineral deficiency.

The following feeding and management practice is recommended to safeguard cows from the effects of mineral deficiency:

(1) Include a legume hay with the roughage; (2) balance the ration with suitable concentrates; (3) feed roughage to the limit of appetite and concentrates according to the production and condition of the individual cows; (4) provide salt; (5) give cows from 6 to 8 weeks rest or dry period between lactations during which time feed them adequately so they will be in good condition when they freshen.

The foregoing recommendations apply to cows capable of producing upwards of 300 lbs. of butterfat a year. For higher producing cows the same practice applies, in addition to which their rations should be supplemented to the extent of 3 to 4 ounces per head daily of a simple mineral mixture supplying calcium (lime), phosphorus, and the elements of common salt. A commercial mixture, if supplying these elements, may be used or a mixture made of equal parts by weight of finely ground limestone, bone meal, and salt will suffice. The mixture is most effective when fed while cows are on summer pasture. Where goitre is prevalent, iodine should be made a part of the mineral mixture or fed separately.

There is no objection to feeding a mineral mixture to lower producing cows though the need for it is not so apparent as with the heavier producers.

Vitamins

Vitamins, like electricity, are known more because of their effect than from their composition. Their function seems to be to promote growth, health, reproduction of young, and the production of milk. Good rations coupled with proper herd management are thought to supply sufficient vitamins and in most cases give cows proper conditions for doing their work.

Herd Management

Good rations and proper feeding alone will not meet all the requirements of a well managed herd. Let us consider the low producing cow, but in doing so let us first be fair and give her a chance to show what she can do. Many a cow has fallen down in one herd and made a creditable record in another. Participation in standard dairy herd improvement association work will do no more to give cows opportunity to show their ability than any practice we know of. Furthermore, it will supply reliable information on which to base selection for breeding, as also selection for the butcher.

After having learned how to make rations and feed them intelligently, let us go a step further and learn that it is economic folly to feed good feed to poor cows.

No sooner does a dairyman learn to feed his cows properly than he realizes the economic relation between crop production, good rations, and profit. In other words, he begins to measure milk production in terms of what it brings per acre of crops grown for feeding.

Every dairyman should find out what succulent feed and what legume he can grow best and then set about producing these in quantities sufficient to meet the full needs of his herd.

We have asked a good many successful dairymen what they considered the most important single factor, aside from good rations and inheritance, that influences the yearly production of cows. The answer has invariably been to have cows in good condition when they freshen.

To bring this about it is necessary that good cows be given a reasonable rest or dry period of from 6 to 8 weeks during which time they should be adequately fed.

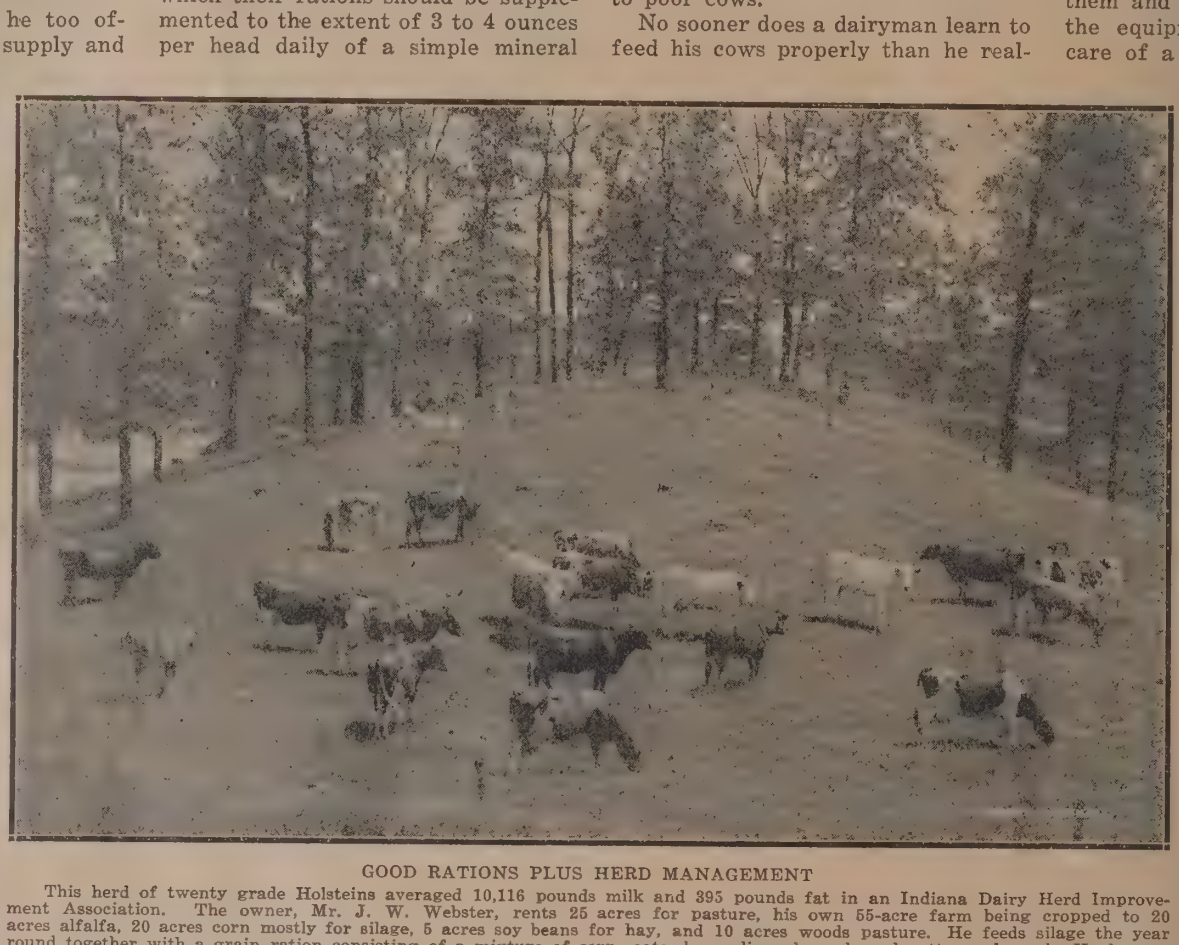
It is not enough to know how to feed cows when they are in milk; one must also know how to feed them when dry.

Since we are here dealing with factors that affect production aside from rations and rates of feeding, we must not forget regularity in feeding and milking. That irregularity in this respect lowers productio has been proven time and again not only experimentally but als by successful dairymen. Good dairymen feed and milk their cows regularly because it pays.

Efficient Labor Important

Aside from feed, labor is the nex largest cost of producing milk. If is important to remove scrub cows is also important to improve scru laborers; it is important to calculat milk production in terms of man la bor used as well as in terms of crop grown for feeding.

Milk production in terms of ma labor used is partly a matter of con venience in the arrangement o barns, feed storage, watering of cow and such like, and in the equipmen for housing cattle and taking care o them and their milk. Some men an the equipment they have will tak care of a great many more cows i a given time than oth er men. It is partly matter of saving th heels with the use o the head.



Disease Control

As a factor of man agement in getting th greatest value from th use of good rations w cannot emphasize to much that of disea control. The first ste in disease control shoul always be proper feed ing and managemen with respect to housin rest periods, and suc like. The second ste is to avoid bringing di ease into the herd fro outside sources. Whe disease appears in th herd it is the part o good management t employ the know practical methods o eradicating the menac

The two diseases o greatest economic im portance are tuberculo sis and contagious abo tion. Tuberculosis ca be easily detected an the cost of its elimina tion is largely in pro portion to how widely it is sprea in the herd. Indifference is costly i eliminating this controllable disease

We wish contagious abortion wer as easily detected and controlled as i tuberculosis. It is widespread and it evils are of great economic concer in dairy husbandry. As far as w know, no one can recommend a meth od of treatment with positive assu ance of success. Many investigation are in progress seeking to discove practical control measures. Som hopeful progress has been made wit the blood test in discovering infecte animals. How to cure or eliminat the disease after it has been disco ered is the elusive part of the prob lem.

It is believed that the majo source of the spread of abortio comes from cows eating feed tha may have become infected with th discharges from diseased cattle. Fo this reason isolate all cows afte service and after calving until a discharges from the vagina ceas Bury the afterbirth, aborted fetu and discharges from all births, an thoroughly clean and disinfect th calving pens. Feed the cows well ar as a factor of safety supplement with a good mineral mixture.

GOOD RATIONS PLUS HERD MANAGEMENT

This herd of twenty grade Holsteins averaged 10,116 pounds milk and 395 pounds fat in an Indiana Dairy Herd Improvement Association. The owner, Mr. J. W. Webster, rents 25 acres for pasture, his own 55-acre farm being cropped to 20 acres alfalfa, 20 acres corn mostly for silage, 5 acres soy beans for hay, and 10 acres woods pasture. He feeds silage the year round together with a grain ration consisting of a mixture of corn, oats, bran, linseed meal, and cottonseed meal. He has an accredited tuberculosis-free herd and retails 400 quarts milk and some cream in a nearby city.

asonable Live Stock Notes

INCE the memory of man runneth not to the contrary, live stock has played an important part in man's efts to convert the resources of na-e's benevolence into useful pur-se, thereby advancing civilization to farthermost parts of the earth. is significant that, where animal bandry is practiced extensively l with a high degree of skill, man oys a happier standard of living.

The season is upon us for the prac-e of good will towards men. Were not a good practice it would not ve lived for nearly 2,000 years.

At this time and in this place we nt to persuade keepers of live ck to improve their practice of od will towards farm animals. If ppiness is gained from a practice the Golden Rule among men we gue that it can be further added to farms by ministering to the com-t, feed, and shelter needs of flocks d herds.

Better Pens for Bulls

A very good friend of ours was re-ntly gored to death by an en-ged bull. The animal was known be unruly but our friend took a ance and went about in the enclo-e unprepared.

It is now a time of year when bulls e more closely housed, a time when se who care for bulls come more en and in close contact with them. r that reason we have introduced is subject with a fatality from care-s bull handling.

We are inclined to the opinion that e kind of place in which some bulls e kept has something to do with eir temperament. Too often they k facilities for working off surplus ergy. When the opportune time rives they work it off on the owner d the widow is appointed to admin-er the estate of the deceased. As rule, the butcher is called on to ad-nister the estate of the bull.

We are pleased to note the activity ong county agents in promoting monstrations for the construction of tter bull pens. While the county ent is doing this let the death of r friend be a timely warning to all ners of bulls to the extent that od men shall not die by the horns an enraged bull.

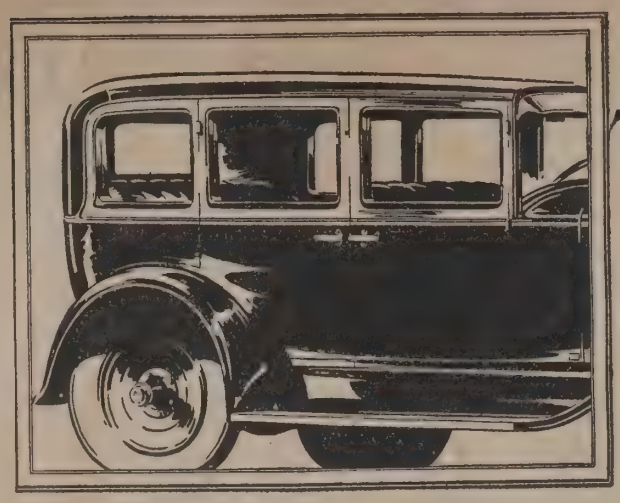
In keeping with our text let us ow good will towards bulls but al-ys behind the defense of adequate eparation.

Subscriber Sends Good Ration

Since this is the season of getting tions properly adjusted to meet e needs of the herd, we are going give you a good ration sent in by e of our subscribers. He has a rd of Jerseys and feeds 25 lbs. lage and 15 lbs. of alfalfa hay per ad daily. His grain mixture is com-sed of 400 lbs. corn and cob meal, 0 lbs. ground oats, 200 lbs. ground rley, 100 lbs. each of cottonseed eal, linseed meal, molasses feed, and ound soybeans, 10 lbs. each of salt d bone meal. It is a little high in otein for the requirements but oth-wise a very good mixture. The reals grains and soy beans are all roduced on the farm.

xpecting Too Much for Some Cows

Among the many inquiries we re-ive on the subject of feeding cows re some that indicate either one of wo things. The herd owner expects o much of his cows or he has cows ot capable of producing up to his xpectations.



Here is one such inquiry from North Dakota in which the owner tates that he is not getting good re-ults from his cows. He is feeding ood alfalfa hay to the limit of appe-ite and a combination of 35 lbs of ground oats and 65 lbs. of ground barley at a rate of one pound for each three pounds of milk produced. Now this ration could be improved by adding succulence and a greater variety of feeds in the mixture and, no doubt, the production would be improved but it is by no means a bad ration in balance or supply of nutrients.

There are many things that will hold the production of cows down below what they are capable of producing but in this case we suspect that the owner has his expectations too high for the cows he has. And this brings up the very important timely question of giving cows a fair opportunity and then of disposing of them if they do not respond.

Alfalfa Did It

A Minnesota subscriber, after telling us his herd has just completed an average of 380 lbs. fat and 9,965 lbs. milk in the herd improvement association, concludes with, "Last winter we paid $21 a ton for alfalfa hay which helped to make the above mentioned herd average. Our feed cost for a pound of fat was 15 cents."

For those who must buy hay before the winter is over let us urge a first consideration of alfalfa. A good slogan is, "You can't go wrong on alfalfa hay in the dairy ration."

The Smooth *Glossy* Surface of every *Body by* FISHER

Note the smooth, glossy, *solid* surface of every Fisher-built body. The chief reason for this is the remarkably fine steel-faced dies which Fisher uses for the production of steel panels.—Manufacturers and engineers from all parts of the world have visited Fisher plants to see these steel dies made—for Fisher is world-famous for its steel press work.—It is because Fisher dies are so precisely made and because they are faced with steel, that they draw the sheet metal out smoothly, evenly. This surface forms the basis for the finer finish which is so apparent on all Fisher bodies.

BODY by FISHER

Steel Paneling—The sheet steel used in the panels which form the exterior of every Body by Fisher, is heavy, tough stock. The sheet steel is cut and pressed into shape by hydraulic or mechanical presses. Some of the presses used in this work exert a pressure of 800 tons, yet they are controllable to the microscopic fraction of an inch.

Wood and Steel Construction—Fisher bodies are constructed of wood and steel. The wood reinforces the steel and the steel reinforces the wood. The *composite* body is the strongest constructed body made. The wood absorbs shocks and sound. It affords resiliency. Fisher bodies through the strength derived from wood and steel *combined*, insure greater safety.

COW BOY SURE HEATER for STOCK TANKS

KEEP COWS HEALTHY

Illinois State Experiments show that 85% of Cows kept in Close Warm Barns tested Tubercular. Prevent this by keeping water tank in open barnyard equipped with a Self-Sinking

COW BOY TANK HEATER Saves Money Every Week

Turn cows out of barn to drink in Fresh Air and Warm Water. "Better drink from a Large Tank than from a Small Bowl." Burns coal, cobs or wood. Outlasts all others. Durable, practical, reliable. Quickest to heat; strongest draft; ashes removed with no check to fire; adjustable grates; keeps fire 24 hours. **ABSOLUTELY SAFE.** Warm water helps digestion; saves grain.

"Purchased 3 of your Tank Heaters last winter, worked very satisfactorily and are well worth their cost. Every stockman should use one." W. H. PEW, Prof. of Animal Husbandry, Iowa State College, Ames, Ia.

KEROSENE GASOLINE GAS OIL DISTILLATE OR GAS

CHRISTMAS IN THE FARM HOME

Lucy Thompson

Merry Christmas to All!

IF I could have my Christmas wish and go darting down the chimneys with Santa Claus into all the homes Hoard's Dairyman visits—what a treat it would be! Stockings in a row in the old fashioned way, picture books, sets of blocks, skates, sleds, all the things children put into their prayers, holly wreaths at the doors, candles in the windows, mistletoe for everyone from grandma to the baby to be kissed under, the kitchen bursting with good things to eat, and upstairs sound, healthy sleepers in all the beds. That is what I wish I might see on every visit, for Christmas is the one day in the year set aside for pure happiness.

To you whose homes are like this there is no need to say Merry Christmas, for you will have it anyway, but to you in homes where grief or misfortune has come I say it with all my heart for the meaning of Christmas—if only our human eyes could see it—outweighs any grief that can come to us. It's only the old, old greeting but it comes straight from the heart of one who somehow can never think of you as a group of "readers" because you always seem like such real friends.

Unto Us a Child is Born

A FRIEND whom I had not seen for several months rang the doorbell one afternoon lately. "Come in," I cried, delighted to see her again.

"No, indeed," she replied, "you come out and see what I've got." Her eyes were sparkling and her whole body seemed vibrant with happiness. I ran out and there in the bottom of the car in a basket lay the loveliest pink baby you ever saw, sound asleep, one little fist clutching a rattle.

"Where—where," I gasped, "did you get him?" You could just see that it was a boy.

"Don't you know I always longed for a baby and I told you I would have one by hook or crook?" she replied. "Well, last Christmas was just too awful and that's what did it. We had our little new house that I fixed up so spick and span, the kitchen was full of good things to eat, we had a tree; everything was all right on the surface but somehow it was a dead house. There was no child in it.

"Well, here was Christmas coming again so the other day I just packed a few things for Andrew and myself and we set off for the—Home. Andrew wasn't anxious but he was willing and that was enough. For my part I was a little shaky but I was never so thrilled in my life. I told the matron that we wanted a little fair-haired, blue-eyed boy. 'Just a minute,' she said and went off, as I thought, to get her notebook. In a little while she came back and laid 'this' in my arms. I just cried!

" 'Don't love him yet!' said Andy, cautiously, 'until we see if he is all right to keep.' But I did just love him anyway and he was all right to keep, too. His parents came of healthy stock on both sides and that is all I was interested in. Yes, he is a little illegitimate baby but then so were some of our greatest men and women.

"Life is so different now; the very commonest things seem changed; we have something to look forward to, something to work for. I can hardly get Andrew out of the house to go to work any more and you should see the Christmas we are going to have!"

Now you may think that I am just making up a story but within two weeks this same thing happened to three of our friends. When we talked to them about it they all said at one time or another during the conversation, "Of course this isn't the real reason we took the baby, but won't it be fun at Christmas!"

I don't believe it would be possible for real parents to love a child more than these adopted parents do. For years they have been longing for a child of their own and now all that longing finds escape in their love.

"Maybe we won't be very good parents even though we do our best," said the first mother, "but I know that Jimmie is going to be a lot better off than if we had left him in that home and we are going to be a lot better people for having him. And Christmas!" she beamed. "I just keep thinking all the time 'Unto us a child is born' and I know how the angels felt that first Christmas Eve."

Christmas Games

BY this time you will have made all your plans for the Christmas evening amusements but unless you are different from most of us another game or two will be a good thing to have up your sleeve. We all know the horrified feeling of the hostess when she sees her planned entertainment being knocked down like a bunch of nine-pins, one game clicked off after another and everything done before the evening is started—no more games ready, not time for refreshments, the guests can't talk, or won't! So I'm tossing you a couple of lifesavers if that unwelcome crisis comes to you this year.

Select a goal at the end of the longest room you have and line the contestants up at the opposite end. At the goal end place as many suitcases as you have contestants and pack the suitcases with such articles as shoes, rubbers, hat, gloves, umbrella, and scarf—all must have the same number of things in them. At a given signal let the contestants start and walk to the suitcases, each one unpack one of them, and dress himself (or herself) in the things found inside, close the suitcase, and return to the other end of the room. When he gets there he must take off the things and repack the suitcase. The one who finishes first gets a simple prize.

Another game that will remind you of the old Marching to Jerusalem is called Parcels Post. This is good because it takes in almost any number of people of all ages. Seat the guests in a circle if you can, or any other way will do, and ask each one to give himself the name of a city. The leader then goes to each one and is told the name that has been selected. He remembers as many as possible of these. He then stands before them and calls out, "A parcel is going from New York to Boston," or any other two cities he may remember, and the people represented by these names try to change places before the leader can scramble into one of their seats. The one minus a seat when the scramble is over is the leader for the next time.

Let's Compare Notes

CHRISTMAS is the jolliest time in the year. No one will dispute that. But where is the woman of any years' experience who can honestly say that she has never once way down in her heart thought it more trouble than it was worth? Oh, no, we never get such thoughts when the tree is all ready to light or when the turkey is emerging from the oven a picture fit to be painted. No, it's when the cranberry jelly runs, the turkey won't give up his pin feathers, or the children in their excitement have upset the pumpkin pies—times like that we say, "Oh, bother, why is Christmas anyway?"

Last year just before Christmas when I was "kinda gittin' sorry fer myself," as Mrs. Wiggs used to say, with all I had to do, I got a fine letter from one of our readers, Mrs. McLean of Nebraska. I'm sure I don't see how she had time to write it just then but I am glad she did for its good Christmas spirit made me forget that I had taken on more than I could do and sent me back to my work feeling that Christmas is really the best time of the year.

"This year meant heavy doctor bills for us and with our big family growing so rapidly with small nieces and nephews we decided that we would exchange gifts. But it's hard to squelch the Chr mas spirit and I've found that it takes more t mere illness and doctor bills. So I'm going to b my sister a gallon of our good winter apple c (we've just tapped the Christmas barrel) and my twin who has just moved into town I hav gorgeous bouquet of bittersweet and three bus of apples. I can just see the bittersweet in a black vase she has. A few worthless roosters had around brought in enough for a camera the kid brother and I couldn't resist a row of F cats so I got one for each of the little ones. much, but my laddie speaks a piece tomorrow expresses it so quaintly that I pass it on to with best wishes for a joyous, healthy Christm

" 'What can I give Him, small as I am?
If I were a shepherd I'd give him a lamb.
If I were a wise man I'd do my part
But what I have, I give—
I give my heart.' "

Her gifts of cider, bittersweet, and apples gest how happily many of the things that t seem ordinary may be used in Christmas gi where money is scarce. And best of all, the qu old verse shows what gift we can always give w we have no other.

Fortunately the feeling that "Christmas is too much work and next year we're not goin pay any attention to it" never lasts long and days following find us feeling rather flat; s that it is all over and wishing that we might kept it going just a little longer. On one of t days when you have a little extra time, won't just take any scrap of paper that's handy write me about your Christmas—what you did was the most fun of all, what droll remarks children made, what you had for dinner, how managed if you found yourself one of those simply had to have some celebration when t was no money—in short, write anything at about your Christmas, sad or gay? Let's com notes; it's always fun. "You go first," as the dren say.

Sisters of the Foolish Virgins

THERE always have been, and I don't d there always will be, people who a quite ready, no matter how much they have. For myself, I have alw had a good deal of sympathy for the ish virgins the Bible tells about fo have known in real life so many lov characters who were just like these virgins.

Christmas is sure to be a breathless day for as these trying to do something—I almost *anything*—at the last minute to give pleasur their families. If you should be one of them, d give up and say, "It's just awful. I've not g thing ready for Christmas and now it's too lat just didn't realize it was so near."

Of course you can't rush right off to town well and buy a lot of things at the last minute you can kill and stuff the old rooster—he prob needs killing anyway—and you can stir up s fudge and make a pie for dessert; or, if that is commonplace in your family, some ice cream. is easily made if you have some good, rich cre Whip it, sweeten and flavor it, and set it out mixture of snow and salt, or ice and salt, and it down from the sides a time or two as it free Get out some of your choicest vegetables, pi and jelly that you canned last summer, make s hot biscuit, and you will have a dinner fit fo king. No one will ever miss the cranberry and other "store" things.

After the dishes are washed the children w love nothing better than for you to join them game of fox and geese, and when you are tire that there are hide-and-seek, hunt the thimble, others of the sort. Or, you can dress clothe dolls, or make cats and dolls out of old stocki or pop corn, or hang up a sheet and make sha pictures behind it. No matter how behindhand are there is always something you can do to c the family stomach as well as the family mind

Neighborly Notes

MERRY Christmas, neighbors of mine! May this be the very merriest and the very happiest all Christmases yet! Through the nths of the past year I have been th you neighbors continually. I have ared many thoughts and many tasks th you. I have told you of the emer. ncy shelf, of the kitchen bulletin ard, we have cooked together in e furnace our Sunday dinners, we ve visited our mothers' clubs to- ther, attended parties, studied lletins of the United States Depart- ent of Agriculture, investigated alth week, picnicked together. I ve taken you with me on a trip to e city where we learned of the ad- nce styles for winter. We have dis- ssed the pleasure and profit of a dio in the home; we have also given rious consideration to electricity in e country home. And lastly we have ared our Thanksgiving together as community gathering of neighbors the little brick church in our midst. of course we must, as neighbors roughout this country and as mem- rs of Hoard's large family, share r Christmas together also. The year ould not be complete without this. I feel so well acquainted with you, d in fact have actually become so ith some of you. One lady from the iddle West greatly objected to my ea of furnace cookery upon the asis of the amount of energy that as lost running up and down stairs, ut another one informed me that she ad wondered for years if there were ot some way to utilize that heat in e furnace for cooking, but had not nown how until she had read that rticle. She assured me the saving in el would be worth considerable to er. Another neighbor, she lived in Milwaukee, objected to my viewpoint f city neighborliness. She thought e city neighbors as friendly as the ountry folk. Then there was an- ther lady who informed me that the tyle notes for fall had saved her the rice of a new pair of silk stockings or her daughter. The girl had for nonths despised a pair of gray stock- ngs she had, but after reading that ray was to be very popular for vinter, took out and cherished her despised gray ones. A man, would ou believe it, accused me of not even aving an emergency shelf. And I ven learned of a relative I did not now I possessed through these Neighborly Notes" of yours and nine. People clear off in New Jersey vere interested in my electric water eater, and so it has gone. And, oh, ow I cherish these new neighbors nd friends of mine and their letters!

And now Christmas is here, and we must find some way to celebrate it as neighbors, and forgetting ourselves serve others. We as neighbors must of necessity make Christmas a day of happiness to our other neighbors, especially those who are not as for- unate in friends as we. And I have a very special plea to make this year, that you hunt up some old person who s lonely and do a kindness to him or her upon this day of days. And I will tell you why.

Within the past month, a very dear old lady has come across the conti- nent to visit us. It is without doubt the last time she will ever make the journey. She had never before seen my children and she took such keen delight in them. She seemed to be letting everything they did sink deep into her mind, as a picture she would have to cherish when she went back to her home in the East. She spoke to me not of how lonesome she was at home, now that her husband had been taken to his final rest, but of how she appreciated any kindness that was shown her. Evidently any attention would give her much pleasure for days and even weeks. And it was the words and acts of the young people that she cherished the most. It was pathetic to hear her appreciation of a kindness. She told me that it made her so happy if someone just spoke to her upon the street. And yet she was a woman who, in her prime, cared not the least for attention from others.

Do we, as neighbors, stop to think of those older neighbors of ours who, having lost their dear ones, are wait- ing so patiently? How little pleasure they have and how much we could do for them without really putting our- selves out. And at Christmastime, of all times, how sad it is for them to be so lonely. There are many friends I had when I was a child, men and women who loved me and who now are very old, that I always send a card to at Christmas. I cannot get to see these folks but I can do this. One lady once told me how much those Christmas cards of mine meant to her, and surely that is very little to do in return for her past kindnesses. Then there are others that I write to and make it a cheery letter of our family. I enclose snapshots of us all, Margy and her kitties, Bobby and his dog, the children on their sleds, and my husband working in the tobacco field. To one dear old friend I once sent a little book for snapshots, with a num- ber in and now from year to year I send her more. In this way she can keep in close touch with us all, and especially with the growth of the chil- dren. As she lives in Seattle she will probably never see them, but still she knows just how they look. I know she spends days pouring over these little pictures.

There are so many ways we can serve these older neighbors of ours. A glass of jelly, a cake you have baked yourself, a loaf of home-made bread with raisins in, or a pretty plant will cheer them for many a week. Take a few minutes to visit with them and let them see that you enjoy it. Let us make this the Christmas of all Christ- mases for these older neighbors of ours. And by serving them, the bless- ing will some day be returned to us, perhaps when we too are old and in need of cheer.

Merry Christmas, dear neighbors of mine!—ETHEL MORRISON—MARSDEN.

Our Ungrateful Children

A FEW days before Christmas a friend and I were talking. She said, "The children don't seem to appreciate their 'Santa Claus' like we used to when we were children; they want so many things." I agreed with her, for the same spirit seemed to prevail in my household. I thought of the one or two little gifts that de- lighted us when we were little and compared them with the lavish gifts of my children that were cherished for but a moment and I thought chil- dren of today are certainly ungrate- ful.

Then like a flash came to my mind a sentence I had heard a couple of months before from the lips of one of our clergymen who had spent the summer in the Holy Land. In a talk before a federation of women's clubs he said, "You women of America are so ungrateful; you have everything: you have comfortable homes, good schools, libraries, hospitals, splendid churches and freedom of worship. You have all freedom and you are not sat- isfied. You are always wanting more, wanting something different. The poorest negro cabin in Virginia is far better than the majority of homes of the women of the Holy Land and you don't appreciate what you have."

He described conditions of squalor, filth, and disease so repugnant to be almost beyond comprehension. We could scarcely believe the horrors he told us for we had never experienced anything in comparison. We really were not so ungrateful for our bless- ings, only unknowing. We have nev- er known such conditions as he had described.

It seems to me that the same answer comes to us regarding our children's attitude. We have always had a superior standard of living compared with most other nations and as we have known no other we cannot compare and so express our gratitude. So with the children; they have always had the advantages they now enjoy. They have not had the experiences we have had. How can they realize their advantages and so be "grateful."

Our efforts in their behalf will be appreciated, silently perhaps, when our children become adults and go through the same experiences through which we are now passing. When my small son brought home the list of books last fall which he was required to have upon entering the higher grade, I footed up the amount. It came within a few cents of ten dol- lars. I said to my husband, "I realize now what it meant to father to keep five of us in school at once."

So it is with other things, our chil- dren are not ungrateful or unappre- ciative, only just human, so do not grieve if they seem so. We think now that we were grateful for what we re- ceived when we were young but I doubt it. Our parents very likely felt the same as we sometimes do. By doing our level best for our children (and that does not mean to always buy them everything we can get the money for) we will be repaying the debt we owe our parents and they in turn will so reward us.—GRACE GOR- DON.

"To My Old Friend"

LAST Christmas this poem was sent by one old lady to another who had been her friend for many years. It was written by her on a card and was, I am sure, copied from another source. It may be that some of you have a friend whom this will just suit as a Christmas greet- ing:

Sending the same old message
Quite in the same old way
Piling wishes on wishes
All for the same old day.

Pledging the same old friendship
Toasting the Long Ago
Knowing that nothing can equal
The times that we used to know.

Praying the years may bring you
All that I wish them to
Grasping your hand in friendship
Proud of a friend like you.

—LUCY THOMPSON.

Be Careful About Fire

ALMOST never a year goes by that someone's Christmas joy is not turned into a holiday trage- dy by fire from the candles or other decorations.

We'll not dwell on anything so un- happy at so joyful a time for often just a word is enough to avert a calamity. So be sure either to have no exposed fire or else to watch it very carefully.—LUCY THOMPSON.

Send for Our Fall and Win- ter Fashion Magazine

You simply must have a copy of our Fall and Winter Fashion Magazine, for it contains too many good things for you to miss. All the new fall and early winter styles of course, and then there are pages of novelties for the masquerade. Articles about health and beauty and reducing safely, and pages showing cor- rect hats, fancy needle work, special lingerie, etc.

While you have the matter in mind send 10c for your copy to our Fashion Department, Ft. Atkinson, Wis.

Miscellaneous Fashions

No. 3151—Looking Slender. Pattern in sizes 36, 38, 40, 42, 44, and 46 inches bust measure. The 36-inch size requires 4¼ yards of 36-inch material with ½ yard of 36-inch contrasting.

No. 2812—For the Smart Matron. Pattern in sizes 18 years, 36, 38, 40, 42, 44, 46, 48, and 50 inches bust measure. The 36-inch size requires 2⅞ yards of 40-inch material with ¾ yard of 40-inch contrasting.

No. 3198—Individual Chic. Pattern in sizes 16, 18 years, 36, 38, 40, and 42 inches bust measure. The 36-inch size requires 3 yards of 40-inch material with 4¼ yards of 1-inch ribbon.

No. 3203—For Every Occasion. Pattern in sizes 16, 18 years, 36, 38, 40, and 42 inches bust measure. The 36-inch size requires 3 yards of 40-inch material with ½ yard of 36-inch contrasting.

No. 939—Outstandingly Smart. Pattern in sizes 8, 10, 12, 14, and 16 years. Size 8 re- quires 1¼ yards of 36-inch dark material with ⅞ yard of 36-inch light material.

No. 945—One-Piece School Dress. Pattern in sizes 6, 8, 10, 12, and 14 years. Size 8 requires 2 yards of 40-inch material with ½ yard of 36-inch contrasting.

No. 944—Entirely New. Pattern in sizes 34, 36, 38, 40, 42, and 44 inches bust meas- ure. The 36-inch size requires 3⅜ yards of 40-inch material with 2¾ yards of binding.

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pat- tern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Our patterns are made especially for us by the leading fashion designers of New York City. No stock of patterns is carried in our office and, since all orders are forwarded to the factory, kindly allow a reasonable time for delivery of any pattern you order.

Young Mrs. Wilkins is so lazy she puts popcorn in her pancakes to make them turn themselves.

Help Your Cattle to Resist Disease

Agricultural colleges, experiment stations and veterinarians everywhere concede that common breeding ailments of cattle, such as slinking calves, barrenness, failure to clean, goitre, and scours in calves are incident to a germ disease.

Modern Methods

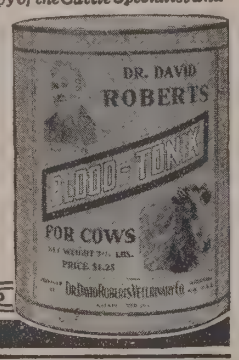
of breeding, feeding and forcing for milk and butter production are practiced at a sacrifice of breeding vitality. Cattle are more susceptible to infection and the germs of disease and such diseases as Tuberculosis and Contagious Abortion more easily develop.

Prevention Better Than a Cure

It is easier and cheaper

If your cattle are subject to any of these common breeding ailments and are not doing their best, it is because there is something lacking. It is now possible for you to overcome these ailments. You can build up the breeding vitality of your herd. You can make your cattle less liable to infection. Dr. David Roberts'

BLOOD-TONIK



is especially prepared to restore the breeding vitality of cattle. Use it regularly and you will note the improved condition of your herd in the increasing number and quality of calves as well as in the quality and quantity of your milk supply.

If your dealer does not have it in stock, order direct. Price postpaid.

DAIRY MARKET NEWS

November Foreign Butter

The following table of foreign butter prices gives the average weekly quotations as published by the U. S. Department of Agriculture:

Market	Nov. 1927	Oct. 1927	Nov. 1926
	Cts.	Cts.	Cts.
New York	49.9	48.4	50.6
Chicago	48.3	46.2	48.9
Copenhagen	41.2	39.6	34.9
Berlin	41.6	41.3	36.9
London			
Danish	43.4	42.1	37.6
Dutch		42.3*	
New Zealand	37.5	38.6	32.3
Australian	37.2	38.1	31.4
Argentine	35.8*	36.3*	29.9
Siberian		34.0	28.3

*Unsalted.

Cheese Prices for November

The wholesale price of cheese on the Wisconsin boards averaged 25.8c in November, a decline of one cent from the previous month but an advance of over two cents above November in the two preceding years. There was a sudden drop of two cents in the middle of the month, but this was more than recovered by the close of the month. There was an advance to 27½ cents during the first week in December.

Cheese production for the first ten months of the year totaled 359,729,000 lbs., a decrease of 24 million pounds from last year. Net imports were 60,491,000 lbs., an increase of six million pounds over last year. With storage holdings at 12 million pounds less than last year, this brings the estimated trade output to 414,845,000. This represents a slight increase in the apparent consumption of cheese.

Daily quotations from the U. S. Department of Agriculture show the following average wholesale prices for American cheese on the Wisconsin Primary Market during November:

	Nov. 1927	Oct. 1927	Nov. 1926
	Cts.	Cts.	Cts.
Twins	25.0	26.3	23.4
Single Daisies	25.8	26.8	23.9
Longhorns	25.6	27.0	24.3
Square Prints	25.8	27.7	25.5
*Receipts since Jan. 1	192,409	179,029	180,803
*Receipts for month	13,379	17,964	15,339
*Storage end of month	12,193	13,132	18,861

*In thousands of pounds at Chicago, New York, Boston, and Philadelphia (i. e.—000 omitted.)

Butter Prices for November

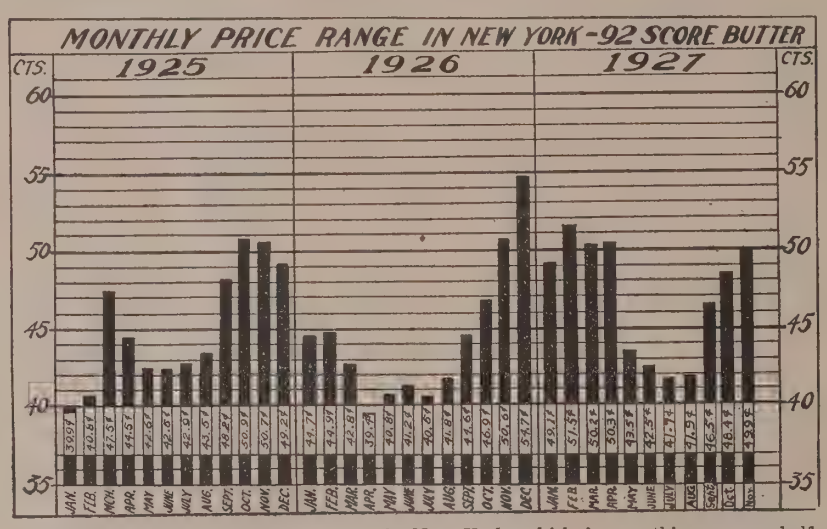
Butter averaged 49.9 cents in November on the New York market. This is approximately half a cent less than for the same month of the two previous years, but is 1½ cents above October of this year. The market advanced 3½ cents during the month and held steady at 51½ cents during the last week in November and the first week in December.

The record stocks in cold storage on September 1 have been largely reduced and this has been accomplished on a butter market with advancing prices. The spread between high and lower quality good has widened to 10½ cents between 92- and 87-score butter, as compared with seven cents in October and four cents last summer.

Creamery butter production for the first ten months of the year was 1,292,542,000 lbs., an increase of 20 million pounds over last year. Net imports were 3,944,000 lbs. and storage holdings were 18 million pounds in excess of last year. This brings the estimated trade output to 1,728,757,000 lbs., a decrease of one-half of one per cent in the apparent domestic consumption of butter as compared with the same ten months of last year.

Daily quotations from the U. S. Department of Agriculture show the following average wholesale prices on 92-score butter (extras) at four of the principal markets, together with receipts and storages:

	Nov. 1927	Oct. 1927	Nov. 1926
	Cts.	Cts.	Cts.
Chicago	48.3	46.2	48.9
New York	49.9	48.4	50.6
Boston	48.0	47.8	48.4
Philadelphia	50.8	49.4	51.6
*Receipts for month	32,820	37,244	33,420
*Receipts since Jan. 1	534,835	502,014	524,276
*Storage (end of mo.)	40,616	55,549	35,497



*In thousands of pounds at the four markets (i. e.—000 omitted.)

Ninety-score butter averaged 45.1 cents for November in Chicago, with centralized butter at this market selling for 45.9 cents. Jobbers' prices on extras sold to retailers averaged 50.7 cents in Chicago, a spread of 2.4 cents above wholesale.

Wisconsin October Butter

Wisconsin co-operative creameries paid producers a net price of 52.3 cents a pound for butterfat in October according to reports from 104 of these creameries to the Wisconsin Department of Markets. These creameries received an average of 46.5 cents a pound for butter, making spread of five cents between the price received for butter and the price paid for fat.

The range in prices paid for fat was from 45 to 56 cents, with the price received for butter ranging from 44 to 49.6 cents. Butter production averaged 24,161 lbs. per creamery.

November butter averaged 49.9 cents in New York, which is something over a half cent less than for the previous two years. The course of the market during the latter part of November and the fore part of December indicates that we may reasonably expect the December average to advance over November as it did last year but probably not to the same extent.

Philadelphia Milk Prices

The Inter-state Milk Producers' Association announces that the December basic price for milk will be $3.29 f. o. b. Philadelphia and $2.71 per hundred at receiving stations in 51—60-mile zone.

The November surplus price was $2.51 f. o. b. Philadelphia. The November surplus price at all receiving stations on railroad was $1.94.

These are based on milk testing 3 per cent butterfat with a differential of 2 cents for each half point of test up and down.

Feed Market Situation

(Grain, Hay and Feed Market News Service Bureau of Agricultural Economics, U. S. Department of Agriculture.)

Wheat feeds continued at slight advance in spite of increased production. Production during October was estimated at a little over 476,000 tons compared with 462,000 tons for October, 1926.

Prices of cottonseed to producers have worked sharply higher in recent months, largely as a result of the small supply remaining. Farm prices of cottonseed on November 15 averaged $37.51 per ton, or over twice as high as the comparable figure of $18.66 a year ago.

Linseed meal prices made a fractional advance in the face of liberal production of this feed. Shipments from Minneapolis from September 1 to December 3 totaled about 43,600 tons compared with about 39,500 tons a year ago. Demand for linseed oil is of good volume.

Gluten feed made a fractional advance in spite of heavy production. Over 8,000,000 bushels of corn were consumed by plants manufacturing this feed in November compared with less than 6,000,000 bushels a year ago and about 6,500,000 bushels two years back. The smaller mills were offering freely at Buffalo where demand was fair but the largest manufacturer was out of the market for December and was offering only for January shipment at 50c a ton premium over December quotations. Demand was good at Chicago and offerings at that point were readily absorbed.

Hominy feed was scarce and higher. The recent advance in corn prices has favored higher quotations for this feed but offerings have also been limited, particularly of white feed.

Alfalfa meal ruled about steady. Top grades showed an advance while medium grades were quotable unchanged and the lower grades were draggy. The demand continues to be chiefly for the best grades of meal which are in limited supply because of the small quantity of the green alfalfa hay suitable for top grades of meal.

Quoted December 10

Standard spring wheat bran: $32.50 Buffalo, $38.75 Philadelphia, $32.50 Chicago, $3 Minneapolis. Hard winter wheat bran: $3 Cincinnati, $29.25 Omaha, $29.50 Kansas City. Soft winter wheat bran: $35.50 Cincinnati, $31.50 St. Louis.

Standard spring middlings: $33.50 Buffalo, $38 Philadelphia, $30 Minneapolis. Soft wheat middlings: $40 Cincinnati, $37 St Louis. Gray shorts: $36.25 St. Louis, $34.5 Omaha, $34 Kansas City.

Cottonseed meal (43%): $48 Chicago, $4 Omaha, $46.40 Kansas City, $41 Ft. Worth.

Linseed meal (34%): $46 Buffalo, $50 Cincinnati, $48 Chicago, $47.50 Minneapolis, $5 Omaha.

Gluten feed: $39.60 Buffalo, $36.20 Chicago

White hominy feed: $44 Philadelphia, $4 Cincinnati, $38 Chicago, $34 Omaha.

No. 1 alfalfa meal: $25.25 St. Louis, $2 Chicago, $23 Omaha, $23 Kansas City.

Wisconsin November Condensery Prices

Forty-seven condenseries reported to the Wisconsin Department of Markets the price paid in November per hundred pounds milk delivered at their factories. Reduced to common 3.5 per cent test basis, these prices ranged from $2.14 to $2.50, the average being $2.28.

Sixteen factories sent delayed reports for October, the average being $2.37. This is 1 cents above the previously reported average of $2.24 for 47 factories.

October Dry Milk

(From Report by U. S. Dept. of Agriculture)

The wholesale prices given below are based on reports from manufacturers governing actual sales f. o. b. factory during October:

Dry Skimmilk: Prices ranged from 7 cents to 11 cents for dry skimmilk in bulk, averaging 9.3 cents a pound for sales, totaling 7,086,312 lbs.

Dry Whole Milk: Prices ranged from 21 cents to 27.5 cents for dry whole milk, averaging 26.1 cents for sales totaling 578,098 lbs. When packed in one-pound cans the price reported was 47.1 cents a pound.

Dry Buttermilk: Prices ranged from 6 cents to 9.5 cents for dry buttermilk in bulk averaging 7.9 cents a pound for sales totaling 1,984,465 lbs. When packed in one-pound cans the price reported was 10.5 cents a pound.

Wisconsin October Milk

Both milk and feed prices in Wisconsin are higher this fall than they were a year ago. The following table shows a comparison of August, September, and October farm milk prices for the past three years:

	Prices per 100 lbs. milk		
	1925	1926	19
August	$1.88	$1.82	$2.
Septemb	1.91	1.89	2.
October	2.06	2.04	2.

For each of the past six months the average farm milk price has been higher than for the same month in any year since 1920.

Sheffield Milk Prices

The net cash price to be paid members of the Sheffield Producers' Co-operative Association, Inc., for 3 per cent, Grade B milk in the 201—210-mile zone for the month of November, 1927, is $2.98 per hundred pounds. This is equivalent to $3.18 for 3.5 milk and is an increase of 31 cents per hundred pounds over the price paid in November, 1926, and is 17 cents per hundred pounds more than the price paid in October, 1927. It is the highest price ever paid for November milk in the history of the association.

Milwaukee November Milk

The Milwaukee Co-operative Milk Producers announce the following prices for the month of November:

For the portion sold as fluid milk, $3.00 per cwt.; and for the portion manufactured, $2. per cwt. These prices apply to 3.5 per cent milk delivered f. o. b. city, four cents being added or subtracted for each one-tenth of one per cent variation in test. Eighty-four per cent of the total receipts were sold as fluid.

American Farm Bureau Federation

THE ninth annual convention of the American Farm Bureau Federation held in Chicago, Illinois, December 5, , and 7, brought out about 3,000 peo-le, the largest attendance since the 'ederation began its fight to accom-lish what its leadership believes to e necessary in order that American griculture may have equal opportu-ity with industry, finance, transpor-ation, and labor.

The finance report indicated that a ound policy of budget estimates and xpenditures has been practiced dur-ng the past year. Thirty-four states aid dues to the amount of $136,023 /hich indicates a dues-paying mem-ership of 272,046. The balance heet shows total assets of $51,336 /ith a surplus of $22,689.

In the opening address of the con-ention President S. H. Thompson ivided his time between a narrative f agricultural conditions in the Eu-opean countries visited by Farm Bu-eau leaders last summer and that of etting before the delegates the eco-omic and sociological aspects of merican agriculture in relation to ther important groups.

After indicating that industry, ransportation, finance, and labor are enefited because of certain govern-mental policies, President Thompson followed with, "The farmers' griev-ance is that the structure (wall of protection) has not been made com-plete" and he "insists the agricultural industry shall be brought within the American policy of high standard of living and included within the Amer-ican system of protection."

As last year, the program efforts of the convention were centered on the continuance of effort to bring about national legislation that is pre-sumed to take care of surplus pro-duction above the domestic require-ments and thereby stabilize produc-tion and price fluctuations.

President Thompson summed up the desires of the Federation in the above respect as follows:

"We want no government price-fixing; we want no government sub-sidy, either direct or indirect; we want to avoid putting the govern-ment into business and, therefore, we insist upon a law that will require each marketed unit of the commodity to pay its share in the costs of its own stabilization and protection."

Space does not permit even a brief summary of the several addresses given. Suffice it to say that there was a very close correlation between the subjects discussed and the report of the resolutions committee.

The delegates approved the princi-ples and policies set forth in the reso-lutions of former annual meetings.

Under the title of "A National Ag-ricultural Policy" a resolution in-sisted that legislation which shall contain the principles of surplus con-trol as embodied in the McNary—Haugen bill shall again be passed by Congress.

The principles now contained in the Madden Bill with respect to Muscle Shoals were reaffirmed.

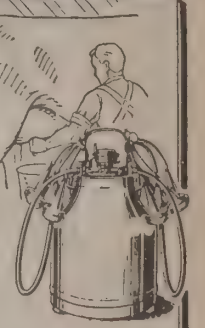
In order that the United States Tariff Commission can be in position to more effectively serve agriculture in the cases before it, a resolution asked that the flexible provision be changed in order that import duties may be increased on various agricul-tural products the cost of production of which can be shown to exceed for-eign costs.

The Federation's position on fed-eral taxation was set forth as fol-lows: "Debt reduction should pre-cede tax reduction. Exemptions and repeated modifications of the nation-al tax structure are undesirable. The basis of federal taxation should be ability to pay. We recommend reci-procity between the states in matters of estate and inheritance taxation. Estate taxes should be retained per-manently. It is unnecessary to reduce corporation taxes in this period of national industrial prosperity. Fed-eral taxes on automobiles should be eliminated." The same position on state taxation as taken last year was reaffirmed.

The resolution on flood control merely set forth what are presumed to be the desirable features of a na-tional flood control program without indicating a determination to sup-port the program.

The resolution on transportation sought to relieve agriculture of pay-ing excessive transportation costs through the following methods: (a) An American Merchant Marine of permanent character, under the au-thority of the United States Ship-ping Board. (b) Readjustment of freight rates on the basis of the Hoch-Smith Resolution. (c) The development of the Great Lakes—St. Lawrence tidewater channel. (d) The rapid completion of the Mississippi-Missouri-Ohio-Illinois river system. (e) Surveys and transportation de-velopments on other main streams.

Sufficient federal appropriations for the continuance of the following projects were asked for: (a) Exten-sion work in agriculture, home eco-nomics, and boys' and girls' club work. (b) For continuation of bovine tuberculosis eradication. (c) For quar-antine and control of corn borer and other insect and plant pests and dis-eases. (d) For fundamental research by the United States Department of Agriculture particularly to include the finding of industrial uses for farm products. (e) Continuation of the usual aid for construction of fed-eral highways and bridges and spe-cial aid in recently flooded areas. (f) For United States Tariff Commission in carrying out the flexible pro-visions of the Tariff Act. (g) For support of the milk inspection bill passed by the sixty-ninth congress.



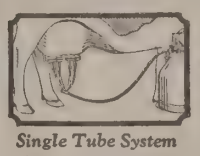
In spite of the fact that nearly 58 per cent of the membership dues in-come of the federation came from the four states, Iowa, Illinois, Indiana, and Ohio, a splendid spirit of co-op-eration prevailed among the dele-gates from all sections of the coun-try. The next largest dues paying states are New York and California and these six states contributed 74 per cent of the total income from members during the year 1927. This co-ordination of thought and action from the various sections of the country on problems of national im-portance is a very definite accom-plishment of the organization. Driv-ing the energies of such an organiza-tion effectively into the solution of the major problems of American ag-riculture and co-ordinating the action with that of other farm organiza-tions is a task that calls for outstand-ing leadership.

At the dispersion of the Jersey herd owned by David Miller & Sons at Eaton Rapids, Mich., 31 head sold to buyers from Michigan, Ohio, and Pennsylvania for $4,785, an average of $227. Seven head sold for over $250 with the top priced animal go-ing for $410. This last was a good 4-year-old heifer sired by a double grandson of Double Interest. She was purchased by Paul H. George of Pennsylvania.

The sale was managed by Chester Folck with J. E. Rappert doing the selling.

It Milks the Cows CLEAN

Say Good-bye to the Drudgery of Hand Milking

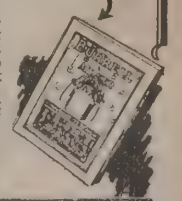


EVER since you can remember, there have been cows to be milked.

Always, twice a day, week days and Sundays, a never-ending grind.

There are some things that have to be tolerated, but the drudgery of hand milking is not one of them. You can say good-bye to it forever. And, the time you save will pay big dividends on the investment. You just can't afford to milk by hand.

The Burrell Milker has enabled thousands and thousands of farmers to take the drudgery out of dairying and increased their profits at the same time. It will do the same for you.



Single Tube System

It will milk your herd easier, quicker, better and more safely than hand milking—and *It Milks the Cows Clean.* And that is why you'll finally come to a Burrell.

D. H. BURRELL & CO. INC.

EFFICIENCY ECONOMY

Efficiency and Economy in the Dairy Ration Mean Dollars and Cents to the Dairy Farmer

Successful feeding consists in maintaining the cow in good health and vigor and at the same time getting the most milk from the feed at least cost.

Christmas in Other Lands

How Juniors Across the Sea Observe This Season of Good Will

In the Philippines

HOARD'S DAIRYMAN JUNIORS:—How would you like to spend your Christmas vacation wading in mud up to your knees planting rice, or climbing tall palm trees gathering cocoanuts, or stripping hemp, or cultivating tobacco under a scorching tropical sun, or riding carabaos or water buffaloes all day while watching the herd, or hunting wild hogs and deer in the mountains among still wilder men? And when your work or play is done loll about in the shade of cocoanut palms and banana trees eating their fruit and perhaps bathing in the warm waters of the south seas or in some inland stream?

IGOROTE OR PAGAN SCHOOL GIRLS

The boys and girls in the Philippines spend their vacations this way. One million boys and girls enrolled in the schools which America established all over the 3,000 islands await eagerly the coming of the Christmas vacation. And they are just as eager for Christmas vacation as you are, and perhaps more so, for their school starts in June so by Christmas they are well weary of it.

Eight thousand schools have been built in various provinces of the Philippines and in every one of these schools a Christmas program is given just before school is out. The programs consist of Christmas carols and

AT CHRISTMAS TIME THE BOYS AND GIRLS HERD THE CARABAOS OVER THE HARVESTED RICE FIELDS

pieces telling of the real meaning of Christmas—the birth of Christ.

The Filipinos have been observing Christmas for nearly 500 years—ever since the great explorer, Magellan, discovered them and baptized thousands in the name of Christianity. Every boy and girl except the pagans and Moros know the meaning of Christmas. Ninety-five per cent of all the people are Christian. The other five per cent are pagans and Mohammedans. Today the Philippine nation is the only Christian nation in the Far East. Christian churches are found in almost every village and city in the Philippines except Moro land and among the pagans. And at Christmas time especially, the churches are actually crowded with the simple folk from city and country.

However, Christmas does not bring to our little brown brothers and sisters Christmas trees and Santa Claus with reindeer and loads of presents. Perhaps it is because there isn't any snow for Santa's sled and no chimneys for him to go down. (No chimneys so the smoke filters out as best it can through the holes in the grass and palm leaf houses.) But even though the presents are few—for the people are quite poor—they all enjoy themselves and probably have the real Christmas spirit as much as do the children of America.

There are a few thousand pagans in the fastnesses of the mountains who never have heard of Christmas—who hunt with bows and spears and pitfalls as they did ten thousand years ago. They know nothing of Christmas, civilization, and Christianity. Their homes are crude houses of bamboo and grass and their food is derived from what can be raised on the steep mountain sides and from what can be obtained in the hunt. Their clothes consist of nothing but a strip of home woven cloth about the loins called a gee-string. They receive no education and marvel at the white man whenever they see one.

It was the writer's pleasure to spend, in company with another American, one Christmas vacation among these people studying their customs and habits, hunting wild hogs and deer, and sitting about the evening camp fires surrounded by a group of curious pantless pagans who never have heard the story of Christmas but whose religion and God are the sun, moon, stars, and the delectable mountains in which they exist.

Wisconsin. MANLY SHARP.

In South Africa

HOARD'S DAIRYMAN JUNIORS:—During Christmas in South Africa we don't have snow to play in nor ice to skate on.

About a week before Christmas Eve many people flock into the towns, especially folk from the country, because they like to do their Christmas shopping early, as they usually have to send presents to their friends by post.

The towns are always crowded during Christmas and the shops do a big business. On Christmas Eve the shops are always open because many people usually find they have to buy more presents, which they formerly have forgotten about. The windows of the shops are usually decorated most artistically.

When Christmas Day comes, everyone usually rises late; but the children usually get up early to see what nice presents they have got. Houses are decorated in the morning; sometimes Christmas trees are had if there are children intending to have a party.

Usually everyone attends church on Christmas morning and when they go home they sit down with open eyes to a nice delicious dinner. Nuts and fruit and sweets are put on the table and everyone really enjoys the dinner.

The farmer has to buy presents for his workers, the natives, as they usually look forward to some gift whether it's a bag of tobacco or a pipe. The natives are very happy on Christmas Day; they do kafir dances practically all day.

The farmer has to rise the same time as usual in the morning to see to his animal feeding and so on. After dinner is over he has to see to his animals again; he does not get much of a holiday unless he goes away and leaves someone in charge of the work. Anyway, everyone is always happy on Christmas Day. Christmas comes but once a year so everyone may as well enjoy themselves on that day.

I would love to spend a Christmas overseas. Perhaps I will be lucky enough some day.

South Africa. PEARL SHEGOG.

In Cornwall

HOARD'S DAIRYMAN JUNIORS:—Christmas is the best time of the whole year; we go to dances and parties, and have a "top hole" time.

MARY ROACH

My friends who are at college training for teachers come home and I have all the news of the year's work.

After a strenuous Christmas Eve, the producing of the family gifts on Christmas morning, and 'ere you have finished examining them, the thud, thud of the postman's feet, who literally peeps between masses of parcels. His Merry Christmas greeting ringing in your ears, you rush indoors with several parcels from friends all over the world, and you know Christmas has begun.

Then on Christmas Day the wheat that has hung over the mantlepiece since the harvest must be taken out and given to the best cow or ox in the stall. This is the remains of an ancient custom called "Crying the heck" in Cornwall.

For the first fortnight in the New Year dressing up in disguise and going around to friends' houses is permitted. The worse you are dressed, the greater the fun. We have been geese dancing (as it is called) twice.

If any of the other Juniors would care to write me, my address is Trewidden Farm, Penzance, Cornwall, England.

Cornwall. MARY ROACH.

"Wishing You a Merry Christmas"

Greetings to You Boys and Girls from Club Leaders in Many States

CHRISTMAS is the season when we are summing up the blessings that have accrued to us and to others in the work of the past year. The extension work has had a most successful year and one of the pleasing results has been recorded in the work with farm boys and girls.

More than 600,000 boys and girls have worked shoulder to shoulder with the colleges of agriculture and the United States Department of Agriculture in spreading improved practices in agriculture and home economics through demonstrations on the farm and in the home. The achievement in live stock and crops produced, in clothing made, and in food preserved is in itself worthy of commendation. The most valuable and lasting results are to be found in the boys and girls themselves. An enlarged vision, a greater determination and a fuller appreciation of responsibility and opportunity are the precious qualities that the 4-H boys and girls have developed out of their club efforts.

The National 4-H Club Camp, held June 16—23, 1927, brought to Washington one hundred and forty outstanding club members. This camp, on the grounds of the Department, gave us an opportunity to know personally a number of these young people. It was an inspiration to all of us to associate with them for a week. It confirmed our faith in the farm youth of America and the future of agriculture.

I wish to take this opportunity to extend the season's greetings of the Extension Service of the United States Department of Agriculture to the farm youth of the United States and to express our special appreciation to the members of the 4-H clubs for the service they rendered during the last year.

C. W. WARBURTON,
Director of Extension Work.

At this Christmas season, the time when peoples the world over celebrate the birthday of the Founder of Christianity, who has a right to be happier than 4-H Club boys and girls who hold daily communion with the living things—plants and animals, and who have ample opportunity to study the mysteries of creation at first hand? For each member and leader we sincerely wish great joy now and in your labors for a constantly increasing 4-H Club family throughout the year.

G. L. NOBLE, Secretary,
Nat'l. Com. on Boys' and Girls' Club Work.

In behalf of the boys and girls of Indiana who are enrolled in dairy calf clubs I want to extend Christmas greetings and best wishes for the New Year to all other boys and girls enrolled in this great work. We have approximately 1,200 members in Indiana who on Christmas morning will probably give their calves a little more feed than usual to remind them that this is a day of good cheer. Possibly in a few of the homes happiness will reign supreme when the youngster goes to the barn and finds that during the night Santa Claus has left a fine young calf with the dairy heifer that is so anxious to show her young owner that she also is blessed with the spirit of giving. May she live for many such occasions.

HARRY F. AINSWORTH,
Ass't. State Club Leader.

Michigan's 4-H family, 20,000 strong, wishes to every 4-H club member and leader a jolly good Christmas for 1927 and a very successful and happy 4-H New Year for 1928. This same wish is extended to all the other folks, especially to the 250,000 boys and girls living on Michigan farms who are not in 4-H Club work. Be with us in 1928 and enjoy a very happy 4-H New Year.

A. G. KETTUNEN, State Club Leader.

The club boys and girls of America have contributed their full share toward the upbuilding of a happy, prosperous agriculture. The success of club work has been due largely to the fidelity and zeal of the boys and girls. To you, the future farm men and women of America, I send Christmas greetings from Idaho. May the New Year bring you joy and happiness with renewed faith and determination to make the best better.

J. H. REARDEN, State Club Leader.

To 4-H club folks everywhere: One of the big inspirations to 4-H club members is to know that they are fellow members in a national 4-H club composed of boys and girls from all states in the Union. The continual achievements of our fellow club members challenge the rest of us to set our standards high and to work with a will to achieve that standard. All the New Hampshire club members join with me in wishing you a Merry Christmas and a Happy and Successful New Year.

C. B. WADLEIGH, State Club Leader.

In spite of the great flood, Louisiana 4-H clubs made progress in 1927. The membership increased from 16,000 to 20,000 and the quality of work improved at about the same rate. Christmas is a time of great happiness. Louisiana 4-H boys and girls are happy and they want all 4-H members in the other states to know that they are happier because of the help and heartfelt sympathy extended our state during the past summer.

W. C. ABBOTT, State Club Leader.

The 28,000 4-H club members in Minnesota have done much to bring contentment, prosperity, and happiness into the farm homes of our state during 1927. May this Christmas time help every 4-H club boy and girl realize the wonderful opportunity of service by doing his or her work so well that someone else may learn from it.

T. A. ERICKSON, State Club Leader.

Happy over the work of 22,000 Tennessee 4-H club members in 1927, it is a beautiful privilege now to join with them in extending heartiest Christmas greetings and wishes for a Happy New Year to 4-H club members everywhere.

G. L. HERRINGTON, State Club Leader.

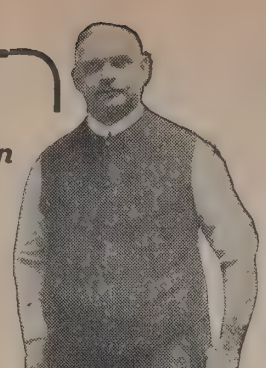
It is the wish of the 4-H Club leaders in Missouri that all 4-H Club members and all boys and girls in America will enjoy the thrills of this Christmas season with its true friendships and delightful associations, its good will and merriment, so that as the years come and go the recurrence of the Christmas time will always bring back pleasant memories to add to the joys of a true Christmas spirit.

T. T. MARTIN, State Club Agent.

The members of the state club leader's staff in Pennsylvania extend to the junior readers of Hoard's Dairyman, and to club members everywhere, their most sincere wishes for a Merry Christmas and a Happy New Year. Nineteen twenty-seven was a most successful year for Keystone Club work. We trust that our members derived both pleasure and profit from their year's work and that 1928 may be even more satisfactory.

ALLEN L. BAKER, State Club Leader.

To the 4-H Club boys and girls 1927 has been frought with great possibilities and many achievements and at this Christmas time we are all thinking of the many good things that have been ours to enjoy. All 4-H club members will agree with the poet who says:



"Life is a gift to be used every day.
Not to be smothered and hidden away;
It isn't a thing to be stored in the chest
Where you gather your keepsakes and treasure your best;
It isn't a joy to be sipped now and then
And promptly put back in a dark place again.

"Life is a gift that the humblest may boast of
And one that the humblest may well make the most of.
Get out and live it each hour of the day,
Wear it and use it as much as you may;
Don't keep it in niches and corners and grooves,
You'll find that in service its beauty improves."

So I am wishing you at this time, the happiest time of the year, that as you are living today you are "thinking great thoughts and dreaming great dreams for from great thoughts and great dreams come great deeds and from great deeds come great men and women. The world has need of these and to you it looks for its future.

W. H. PALMER, Ohio State Club Leader.

DON'T WEAR A TRUSS

BE COMFORTABLE—Wear the Brooks Appliance, the modern scientific invention which gives rupture sufferers immediate relief. It has no obnoxious springs or pads. Automatic Air Cushions bind and draw together the broken parts. No salves or plasters. Durable. Cheap. Sent on trial to prove its worth. Beware of imitations. Never sold in stores nor by agents. Every appliance made to special order and sent direct from Marshall. Full information and booklet sent free in plain, sealed envelope.

MR. C. E. BROOKS

BROOKS APPLIANCE CO., 219A State St., Marshall, Mich.

My wish from Alabama for each 4-H club boy and girl in the United States is health, happiness, and a generous Santa Claus for Christmas and prosperity for the New Year.

T. A. SIMS, District Club Agent.

Rhode Island 4-H club boys and girls with "clean, quick minds in clean, strong bodies" as their first goal send their Christmas greetings and best wishes for a year of greater health to all 4-H club members who read this message.

LORENZO F. KINNEY, JR.,
State Club Leader.

Greetings! 4-H club work—its past record and progress—that's a worthy thought for our Christmas season. From Iowa 18,000 4-H boys and girls greet the other thousands in club work in the United States. May we all look into 1928 with cheer and hopefulness is our wish.

P. C. TAFF,
Ass't. Director Extension.

The Christmas season is a season of "passing on" of good cheer, and I do not believe that there is anything that would pass on more cheer to the agricultural industry than the boys' and girls' club work. Quoting from a recent article by an agricultural editor of the Midwest: "We have said, and we reiterate the belief, that this (4-H club work) is the most promising movement on the horizon of agriculture today." Nebraska 4-H club folks are doing their best to make it a real Christmas.

L. I. FRISBIE, State Club Leader.

Boys' and girls' clubs are increasing in their extent and usefulness. Farm leaders of today are emerging from the ranks of the 4-H club members of yesterday. May this and each succeeding Christmas season find more and more of the youth of the country imbued with the 4-H spirit is the message from South Dakota.

H. M. JONES, State Club Leader.

Washington has 7,000 club members. More than 500 men and women are working generously as leaders with these boys and girls. We wish to congratulate this fine group of people, and other similar groups in the United States, upon the splendid contribution they are making to the social and economic welfare of our state and nation. May a full measure of Christmas cheer be theirs.

ELMINA WHITE,
R. M. TURNER,
W. W. UNDERWOOD,
W. D. BUCHANAN.

With definite results as proof of progress, North Dakota Club members and workers feel very grateful and hopeful during the Christmas season. Our message can best be portrayed by the statement of a successful member after nine years' experience: "Club work has taught me to be broader minded, to co-operate with others, to know that only by honest, diligent labor can we ever hope to attain greater ends."

H. E. RILLING, State Club Leader.

Christmas greetings from Maryland to the many hundreds of 4-H folks whom I have met at national and interstate affairs, and to all of you, who, by keeping our wonderful 4-H pledge, are striving to live the four-fold life. May we, like Him whose birth we celebrate, "increase in wisdom (the head H) and stature (the health H) and in favor with God (the heart H) and man (the hand H.)"

E. G. JENKINS, ("Daddy Jenks"),
State Club Leader.

If you would be a true 4-H club member carry the Christmas spirit in your heart throughout the year. My season's greetings to you from West Virginia are that through your 4-H club work may you be able to find out what the secret thing is that holds the 4-H's together. Why don't we have five or why don't we drop one? See if you can tell.

W. H. KENDRICK,
In charge 4-H clubs.

Christmas is here! All boys and girls are happy; good cheer prevails. A backward look over the old year and a forward look into the new gives one a fine opportunity to study his accomplishments in 4-H Club work. May Christmas be to all club members the turning point to greater endeavor and achievement is our wish from South Carolina.

B. O. WILLIAMS,
State Boys' Club Agent.

North Carolina club members are happy this Christmas because their family has increased 3,000 since last Christmas; 47 counties held encampments; 600 attended the State Short Course at State College; and becau club work has enabled them to ha more money and because 4-H cl work is building up a greater co munity spirit throughout the state.

A bit o' Christmas cheer
Is good everywhere,
So let's stop long enough today
To do something in the good old 4-H way
To make someone else happy on Christmas D

L. R. HARRILL, State Club Leader.

At the close of another wonderf year in 4-H Club work in which W consin has had more achievement cl members than ever before, I am mo than happy at this Christmas time be associated with this great 4-H Cl organization. To live with you people—work with them—play wi them—and council with them, is i deed a happy lot. Edgar Guest mu have felt just as I do when he wro these lines:

"I'm wishing at this Christmas time tha could but repay,
A portion of the gladness that you've stre along my way.
And could I have one wish this year, t only would it be,
I'd like to be the sort of help that you h been to me."

T. L. BEWICK, State Club Leader.

A spirit of good will and fellowsh is one of the outstanding prevaili characteristics of all 4-H club peop thus the Yuletide is a season of sp cial significance to all engaged such work. No season of the ye carries with it so many possibilit for happiness and fullness of joy a service to one another as does t Christmas time. The Christmas wi from Kansas is that all 4-H club pe ple may realize the special signi cance that this season carries t them and may seize the golden oppo tunities awaiting them, for in th way this Christmas will prove to a great blessing and joy to all.

M. H. COE, State Club Leader.

That Runt Pig Again

You will remember that in the D cember 10th issue there was an a count of Lee Griffitts, Tennessee cl member, and his "runt" pig that fa rowed 78 pigs in 3 years which sold f $1,929. Since publishing that sto we have received the following inte esting news from County Agent C. Baker: "Lee's sow farrowed 14 pi the night of December first. S looks fine and good for several yea yet."

Our Review Column

[A regular feature of the junior departme reviewing the contents of Hoard's Dairym for the previous issue. Let's talk it over.]

There are some pointers worth r membering about feeding the dai cow in that article "Fitting the Fe to the Cow" published in the Dece ber 10th issue.

What are the two most comm errors in feeding grain to cows? underfeeding of quantity; 2, u derfeeding protein.

What should a good grain mixtu include? Two carbonaceous fee such as corn, grain sorghums, barle oats, and hominy feed; two high pr tein feeds such as linseed meal, cotto seed meal, gluten meal, soy bean me gluten feed, and ground soy bean and one bulky medium protein fe such as bran.

At what rate should the grain mi ture be fed? For Holsteins, Ay shires, and Brown Swiss one pou for each 3½ to 4 lbs. of milk pr duced, and to Jerseys and Guernse 1 lb. for each 2¾ to 3¼ lbs. of mi produced.

Merry Christmas

BOYS and GIRLS!

Do you belong to the Hoard's Dairyman Juniors' Club?

Every Junior reader of HOARD'S DAIRYMAN should be a member of this great club. *IF* you believe in the dairy cow—and you do—*IF* you want the emblems—*and you do—IF* you are not yet 21 years old and some member of your family is a regular subscriber to HOARD'S DAIRYMAN, *THEN* all you have to do is sign the membership application and send it in. Simple isn't it? Costs nothing to join and no dues. Thousands of REAL, LIVE, RED-BLOODED BOYS and GIRLS are now members of the club. YOU ARE NEXT!

Do you belong to a Boys' and Girls' 4-H Club? ..... If so, what kind? .....

Swine

Two Good Supplemental Mixtures

SWINE producers who are anxious to push their spring pigs to a handy market weight of 225 lbs. as rapidly as possible could well consider two supplemental mixtures that gave good results this past season at the Iowa Experiment Station.

The pigs were self-fed shelled corn on pasture. One lot was fed a supplemental mixture of three parts tankage and two parts linseed meal at a rate of from one-third to one-half pound per head daily. They reached 225 lbs. on October 5 at a feed cost of $6.23 a hundred pounds gain. Another lot was fed a mixture of three parts tankage, one part linseed meal, and one part cottonseed meal with shelled corn and pasture. They reached 225 pounds on October 4.

It would be interesting to know what the results would have been had two or three pounds of skimmilk been fed daily to each pig. A little skimmilk goes a long way even when fed with a good ration.

Feeding Oats to Pigs

The place of oats in the swine ration has never been entirely satisfactorily determined. An experiment reported by the Iowa Experiment Station this year gives oats a better standing than it has heretofore had.

From weaning time until about the middle of August pigs were given all the ground oats they wanted from self-feeder in addition to which they had one pound of corn per head daily and a supplemental mixture of three parts tankage and two parts linseed meal. After that date, the corn, instead of being restricted, was fed in a self-feeder. They reached 225 lbs. on October 17 on a requirement of 230 lbs. shelled corn, 117 lbs. ground oats, 14 lbs. tankage, and 9 lbs. linseed meal for 100 lbs. gain.

The ground oats was charged at 17 cents a bushel and the corn at 84 cents. It would seem from this that when oats are worth less than half the price of corn, and feeding restricted mainly to the early part of the growth period, and corn used to finish the pigs, ground oats have a very good place in the swine ration.

We should add that this lot of pigs received a simple mineral mixture composed of 40 lbs. bone-black, 37 lbs. finely ground limestone, 20 lbs. salt, 3 lbs. iron oxide, and one-third ounce potassium iodide.

Cross-bred Pigs Made Most Rapid Gains

As we have often stated that other factors besides feeds promote production from cows, so it is found true with the gains made by swine.

This year at the Iowa Station a group of cross-bred Duroc-Poland pigs beat a group of pure-bred Polands to the handy market weight of 225 lbs. by 12 days' time and they did it on 6 lbs. less feed per 100 lbs. gain, the cross-breds requiring 380 lbs. and the Polands 386 lbs. for 100 lbs. gain.

Some work last year and this, however, proves that it is poor policy to use cross-bred pigs for breeding. Some pigs of a Duroc-Poland cross were bred back to a Poland boar and others to a Duroc boar. The three-fourths Poland pigs weighed only 194 lbs. and the three-fourths Duroc pigs 207 lbs. as compared with 232 lbs. for pure-bred Polands and 250 lbs. for pigs of the first generation Duroc-Poland cross.

Cereal Grains are Good, But—

Again we call attention to the dangers of feeding fall pigs during the winter on a restricted cereal grain ration. These grains—oats, barley, and corn—are low in mineral matter in addition to which the quality of the protein they supply is not entirely satisfactory; furthermore, essential vitamins are lacking. The results of a prolonged cereal grain diet are rickets and general unthriftiness. Alfalfa hay corrects the faults of cereal grains. Skimmilk corrects the deficiency in protein quality as also supplying some calcium.

Sanitation, Exercise, and Feeding

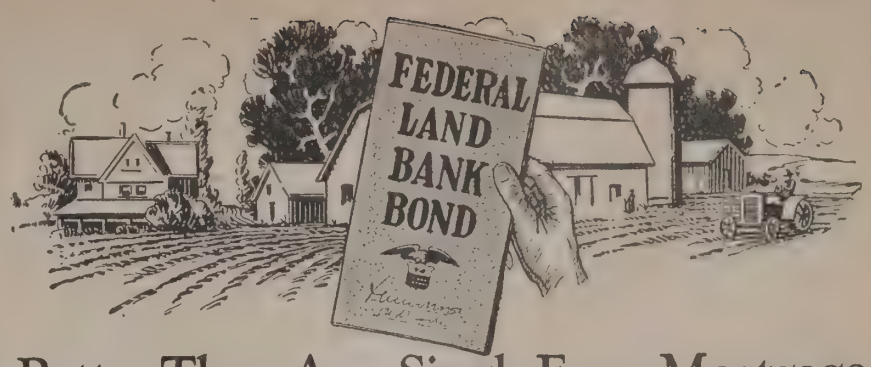
Three things of importance with the swine breeding herd during winter are sanitation, exercise, and feeding.

The sleeping quarters are of chief concern from a sanitary standpoint. No hog can thrive properly if its bed is damp or dusty, more especially a pregnant sow. The condition of the range has something to do with keeping the bedding dry but ventilation also may affect this. The floor construction also may affect the condition of bedding.

Neglect of exercise of pregnant sows is often responsible for disappointing results when their litters are born. That exercise has a relationship with the strength and activity of pigs has been proven a number of times by carefully controlled experiments. Furthermore, as a rule, sows that have a reasonable amount of exercise during pregnancy bear their pigs with greater ease.

As a rule, pregnant sows will take enough exercise if given reasonable opportunity which means adequate range. During severe weather when there is a tendency for sows to stay close to their sleeping quarters, one may frequently induce the proper exercise by requiring them to go a considerable distance for their feed.

If the ground becomes coated with ice or sleet, pregnant sows should not be forced to travel about on it. Neither should they be induced to wallow unduly in deep snow. A good way to make a safe passage over ice or sleet is to scatter straw in the evening, wetting it down with water. Freezing during the night fastens the straw to the coat of ice and makes a roughened surface over which sows may safely travel.



It is worth while for swine producers to keep in mind the physiological requirements of pregnant sows in preparing their rations.

The mature sow needs feed for maintenance and for the fetal growth of her unborn litter of pigs. The gilt or yearling sow in addition to the above requirements must also have enough feed to support growth towards normal mature weight. Any sow—be it gilt, yearling, or mature one—if underweight for age at breeding time, should be made to gain enough throughout pregnancy to be in normal condition at farrowing time.

A ration that is good for maintaining the weight and condition of mature sows is not necessarily a good one to supply the needs of fetal growth.

For example, a mature sow could maintain her normal weight on corn alone but she could not develop a strong litter of pigs from such a diet.

The cereal grains, a little skimmilk, some alfalfa or clover hay, and a simple mineral mixture supplying calcium and phosphorus make a very good combination for pregnant sows. In the absence of skimmilk one could either use powdered skimmilk or tankage. All feeds except the hay should be somewhat limited to the condition of the sows.

Better Than Any Single Farm Mortgage

Federal Land Banks are located at:

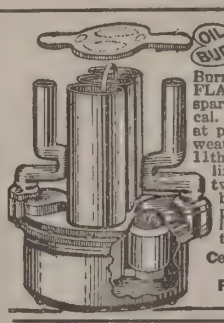
A Brighter Future



WE no longer plant by the light of the moon. . . . Agriculture has become a sound business, depending on the volume of its income, the same as any other business. . . . . Fortunately, during 1927 conditions have been more favorable for the farmer. His income will probably be greater this season than last. He is looking into a brighter future.

By investing this increase in income wisely, he can make the most of the opportunity to build a sounder and more profitable business undertaking. Advisory groups and agricultural bureaus are available to help him, because they realize that the prosperity of the farmer is the basis of all true prosperity.

It is in accord with this general policy that the work of all departments of the N. V. Potash Export My., is conducted.

Which Shall It Be

(Continued from page 1185)

or bull situation in the United States with our occasionally tested cow and see who has a rational breed improvement plan.

What can be said of Denmark in this regard can be said also of Holland and Scotland. In Scotland more than 50 per cent cent of the Ayrshire herds are in test associations.

With their present attitude toward testing and the purpose and use of records, the Scotch, Danish, and Holland breeders can follow very closely all blood lines and quickly spot out those lines that are bringing about improvement and use these to the best of advantage and also to eliminate those which are showing a detrimental influence on the breed. In random selection of the records fifty living average Danish bulls most of them in use in bull associations, we found that their 826 daughters exceeded the production of their 826 dams by 31 pounds butterfat.

It must be borne in mind that the information was available to the breeders using these bulls. The cattle breeding societies each year compile information on countless numbers of bulls and the breeders are making the greatest use of this information. Every new bull is carefully watched and his daughter's production quickly tabulated against the dams' records to see whether he is desirable to use.

The whole attention of the breeders, breed associations, and workers is centered on using every agency which will help to improve the average rather than to produce the phenomenal. They have found out, as we must find out, that after all it is not the occasional phenomenal cow but successful breeder who makes the dairy business profitable and successful, but rather the development of the average by the constant and consistent elimination of the undesirable and unprofitable to where it brings success and benefit to all.

Our breed associations could well consider spending a large portion of their yearly income in compiling information about the bulls being used within their breed, and publishing this material while it is fresh and worth something to the breeders, owners, and prospective bull purchasers.

The newly developed herd test plan already in operation by the Ayrshire Breed Association and to be put in operation by the Holstein Association while still probably imperfect, is the first real forward step outside of the cow testing association work which has been taken by American breeders. When the principle of testing *the herd all the time* under normal daily conditions becomes a breed wide and national-wide practice, the herd and breed improvement will truly begin. May that day not be far o

Action by the National Grange

hen a national farm organization command the attendance of 10,- of its followers at its annual ting, it is a sign of capable lead- ip and sound policies. That is number that participated in the y-first annual session of the Na- al Grange which was concluded leveland, Ohio, on November 25. he seventh degree was conferred 5,950 Grange members at that , among whom was Senator Ar- Capper, of Kansas. Voting dele- s represented twenty-eight states.

ouis J. Taber was overwhelmingly ected National Master. That the nge is truly of national scope is vn by the fact that the sixteen ibers of its national board, elect- represent fifteen different states.

he principal declarations on which on was affirmed at this session as follows:

he National Grange reaffirms its ocacy of the export debenture for practical farm relief, as ef- ive, workable, and without the ssity for setting up costly admin- itive machinery; the plan being able of independent application or combination with other sound edies; and the Grange declares its liness to cooperate with any other ip or organization in bringing it immediate relief.

he National Grange declares that time has come when tax relief for overburdened people must be id, especially for the farm and ie owners of the United States; es a refund to the states of a por- of income and inheritance taxes e distributed for educational and rovement purposes; opposes re- tion in income taxes at the pres- time; and advocates curtailment state, county, and local expendi- s until such taxes are materially ered.

he National Grange demands the ervation of the cooperative fea- s of the Federal Farm Loan Act insists upon provision for long- e amortized loans for permanent elopment projects by farm co-op- ives.

he National Grange demands a rous enforcement of the Eigh- th Amendment and the Volstead ; pledges its entire energies in be- of such enforcement measures as present situation demands; and rs stern punishment for all ven- s in narcotics.

he National Grange declares its tinued support of the direct pri- y and will vigorously resist the rts now being made in various ions of the country to overthrow

he National Grange declares its ualified opposition to further ex- diture of federal funds for irriga- and reclamation projects so long he present surplus of agricultural ducts continues to depress the sell- price of farm crops.

he National Grange pledges its tinued efforts for the establish- t of a National Agricultural Day congressional enactment.

mong the projects which the nge voted to favor the following of significant importance:

doption of the budget system by es and local taxing units, with itive debt control.

long-range reforestation pro- m with adequate measures to pre- e the nation's remaining natural ources.

etaining control of the Federal m Loan system in sympathetic ds and making it function for n benefit to the full extent of its tors.

ariff revision by competent ex- perts instead of by congressional action on political basis.

Employment of agricultural research work more in the lines of marketing and distribution and less towards production.

Camel

The cigarette preferred by experienced smokers

In the remarkable growing popularity of the cigarette many brands have bid for favor, but Camel continues to lead by billions. Quality put it there; quality keeps it there.

If all cigarettes were as good as Camel you wouldn't hear anything about special treatments to make cigarettes good for the throat. Nothing takes the place of choice tobaccos.

© 1927, R. J. Reynolds Tobacco Company, Winston-Salem, N. C.

C. T. A. Cows Bring Good Prices

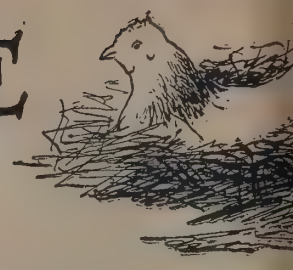
Eleven grade Holstein cows with cow testing association records sold at auction for an average of $158.75 (not including one three-teater producing 208 lbs. fat). This was $78.75 higher than the average price paid for five ordinary cows (averaging $80 each) sold at the same sale without records. The above report was made by Guy S. Hales, county agent of Ozaukee County who attended this recent sale of George Weideman, a member of the Cedarburg—Grafton Cow Testing Association. Among the fifteen cows sold with records, three of them were registered Holsteins and 12 were grade cows.

Production records ranged from 208 to 475 lbs. fat for the year. The reported average production was 380 lbs. fat. The high cow of the sale was a 9-year-old pure-bred. In three months she produced 170.4 lbs. fat averaging 56.8 lbs. per month. The fifteen-cow herd sold at an average price of $161.16. The three registered cows brought $201 each, including the nine-year-old cow. Why was there a difference in the price of $78.75 paid for known production? It pays to know your cows better.

Wisconsin. A. J. CRAMER.

Healthy Cows and Highest Possible Production

are assured by letting them regulate their salt and water supply themselves.



We have perfected a salt and mineral feeder of special glazed stoneware, with metal clamp, that has stood the severest tests in bull pens. They are practical and permanent. IDEAL SALT FEEDER COMPANY Morristown, Minnesota

Children sweeten labors, but they make misfortunes more bitter; they increase the cares of life, but they mitigate the remembrance of death. —LORD BACON.

A DIFFERENT TALE

J. B. Hayes

"THERE ain't no money in chickens."

"What makes you believe that, Sam?"

"Believe it? I have had them for the last thirty years; they are always in where they don't belong; they never lay when they should, and besides I don't believe in keeping hens."

"What kind have you kept?"

"Well, I don't take much to these full bloods. They are always kind of sickly-like and don't live as long as the kind we keep. Ours are always kind of mixed up because we got roosters from the neighbors and they live for a long time."

"Do you get many eggs?"

"Well, yes, in the spring."

"Did you ever try baby chicks?"

"No, we don't believe in that kind of stuff. Hens are supposed to hatch their own chickens. When you start fooling around with them fellows that sell baby chicks, it don't seem like they sell you what is right. They cost too much, too."

"Did you ever keep any records?"

"Records? You mean how much the feed cost and that kind of thing costs? Us farmers ain't got time for that. We are too busy for monkey work with a pencil. Besides, nights a fellow is supposed to sleep."

"Would you believe the records that some other farmer might give you for his own flock? There must be some hens that make a profit because their income, even in Wisconsin, which is not one of the biggest poultry states, is equal to or exceeds the farm taxes. That should mean something or, possibly, your taxes don't bother you."

"Yes, the taxes is plenty any place."

Oscar Westberg's Flock

"Suppose you hop in here and we will take a shot around Douglas County and show you some flocks that are doing only what any other flock owner can do if he observes the necessary fundamentals."

"All right, but listen, don't drive too fast."

Oscar Westberg has always had a small flock of poultry on his farm. The conditions were not ideal because the flock was too small for real profitable management. He usually had about fifty hens. The house was makeshift and often water would stand on the floor. The difference between Mr. Westberg and the average poultry keeper was the difference in the individual. In spite of poor conditions, but because of care, he was able to get eggs.

In branching out into a farm flock that was part of the farm operation, it was not necessary to convince Mr. Westberg that poultry was profitable. He needed to build a satisfactory house and produce a flock of sufficient size to warrant the economical expenditure of time and investment.

The first step in the program was the building of a Wisconsin straw loft house. This was advisable under his conditions since this house was designed for his climatic conditions and had proven satisfactory in use in that territory. During the past year the house has been dry, Leghorns have not frosted their combs, and a high average production was obtained. A 20'x40' house was constructed for about 250—300 pullets.

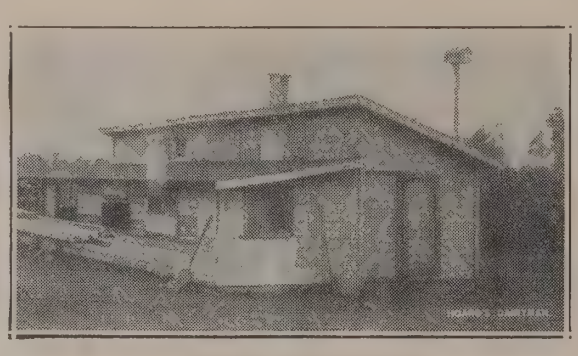
His second problem entailed the purchase of chicks. Since egg production was desired he bought from a hatchery that produced quality,

SANITATION FOR TURKEYS
Hatched May 10, 1927; photo taken Sept. 25; weight 16 lbs.

bred for production chicks. Usually one should purchase three chicks for each pullet housed in the fall.

In this instance brooding was considered as a definite system requiring definite steps and care rather than a question of luck, the same as "shooting crap" or playing poker. Too many people are apt to place the blame for poor brooding results on "luck" rather than accepting part of the blame themselves.

Due to proper brooding a count of the chicks at eight weeks showed a total of 606 out of 600 purchased. All of the extras given to assure 100% live delivery by the hatchery had not been lost. This is an extreme instance but a fact.



The chicks were brooded under two coal burning brooders and raised on clean ground. They were also fed a complete ration. In fact they were carried for the first six weeks in the house to assure proper sanitation and attempt to prevent intestinal parasites. The broilers paid for the pullets.

Only pullets were placed in the laying house. They were housed by the first of October and were then kept in confinement. Some production was obtained during October but the record which Mr. Westberg has starts with November.

During the winter a scratch ration consisting of 2 parts corn, 2 parts wheat, and 1 part oats was used. This season heavy plump barley replaces the oats.

A mash mixture of 100 pounds each of ground yellow corn, ground oats, wheat bran, standard middlings, meat scrap, and 1% or 5 pounds of fine salt is used. Last year no cod liver oil was added, but this year 2% will be combined with the mash.

Second cutting of well cured alfalfa hay is available so that the flocks have access to the leafy portion as a source of green feed.

BEFORE REMODELING

AFTER REMODELING

QUALITY CHICKS PLUS CLEAN RANGE PLUS RIGHT FEED EQUAL PROFITABLE PULLETS

Electric light is supplied from dusk to 7:30 night. This permits the flock to have about a hour day.

There isn't anything particularly secret a that program of good house, good stock, good and good management. The result of that bination is given in the following record from vember to September 15. At that time the were moved to allow the house to be cleaned prepared for the pullets that moved in about ber 1st. Housing before production starts ten prevent a false molt.

How Mr. Pleski Handles Poultry

Moving down the road to Leonard Plesk find a different poultry layout. This offers a ch to see what is required in building up a high duction strain.

All of the flock is trapnested all of the time they are on the place. The active co-operati the other half of the family is required. This required in record keeping, pedigree hatching wing banding is more than the average farm poultry keeper can devote, but is a job that s one must do in order to supply the class of b ing stock that will produce profitable flocks.

The highest hen is a Tancred bred pullet produced 307 eggs in her first laying year. ing a record of that sort results in one of thrills that comes but once in a lifetime.

Back-tracking to B. H. Doughty draws a tion to the effect of of hatching on p Everything from a bed to a race horse be prepared before sults can be expe That should incl poultry.

Pullets were chased at two diff times. They were b ed under the same ditions, fed the sam tion, and cared fo the same way. The start resulted in maturity and conse inability to come through with a heavy produ

for the high price market during October, No ber, and part of December. The ration was

BUILDING REMODELED FOR A POULTRY HOU

e same as that used by Mr. Westrg except that cod liver oil was ed. It was also interesting to find at when the oil feeding was distinued because of the supply be exhausted, trouble was noted in ver production, poor shell texture, d egg eating.

The preceding table shows the difence between April and May tched pullets. The number in each ck was not the same but the ine over feed cost per pullet is ren.

Sid Van Buskirk's Method

A stop at Sid Van Buskirk's also ows the effect of constructive eeding on records. The stock in s instance comes from the Unirsity with a later top cross of Tan-ed. About 125 birds are carried in 20x20 straw loft but the quality is gh.

A breeding flock is a different oposition from a commercial flock. ie hen that made a cord of 267 eggs is ll kept although she seven years old. iat practice in a layg flock would be a rious mistake. This st year he has deloped one pullet that oduced 306 eggs. December 1 this llet was still proicing heavily.

How Mr. Lasch Manages

A little longer drive fers a contrast beveen the profit from ns and pullets in e flock of R. C. asch. The contrast is even greater an usual because the hens were tter than the average since they d been closely culled:

Month	Average production Hens	Pullets
November	.777	5.13
December	.38	11.94
January	1.98	1.98
February	9.76	9.76
March	18.62	18.62
April	22.00	22.00
May	23.53	23.53
June	21.03	21.03
July	20.09	20.09
August	16.30	16.30
September	10.33	7.28
October	2.36	9.94

The hens averaged 147.15 eggs per year, hile the pullet average was 182.17 eggs per ar.

During the month of November, this year, flock of 232 pullets returned a gross income about $200.

Another problem enters into this en vs. pullet argument, since some ock owners have a special market at demands large eggs. Pullets will roduce small eggs for a limited pe-od when production starts. To overme this handicap some people hold ver a few hens as a part of the ock. The same results can be obined by moving the hens from the ying house to the colony house. The ying house can then be filled with ood pullets. As the hens stop layg they may be sold on the market.

A breeding establishment presents different problem. The income om a hen is dependent upon her ecord, her ability to transmit that haracter to her progeny, and the ngth of time that she can be used s a breeder. The longer she is kept he better. This is the principal difference in what one might advise for breeding flock or a laying flock.

"Do they all follow the same program?"

"Well, the foundation is the same respect to their use of a Wisconn type house either new or rebuilt. hey grow their chicks on clean round, hatch early, use a complete ation and feed cod liver oil. Some variation in the ration is made. They may drop the oats in the mash and add another hundred pounds of ground corn. The mixture would then be 200 lbs. ground corn, 100 lbs. wheat bran, 100 lbs. standard middlings, and 100 lbs. meat scrap, plus 1% of fine table salt and 2% of cod liver oil.

The fact that the use of cod liver oil is a practice that the average poultry keeper adopts is best evidenced by the fact that one feed concern is using two barrels a week in the mash mixed and sold locally, while another party in the same section of the state has placed about 1,500 gallons this year. This all went to farm, and not commercial, flocks.

The entire poultry income is not limited to chickens and eggs. Several farms are raising from 200—500 turkeys each year. Their success is due to following a definite system of sanitation which permits them to rear the young stock on clean range in confinement each season.

PULLETS READY FOR HOUSING

It is true that chickens are creatures of habit. When their methodical habits are disrupted or changed, trouble usually results. A change in housing or feed may throw pullets into a molt. However, when a practical method is outlined and followed, proper results can be obtained.

It isn't necessary to agree with the wild-eyed speculator, or the fireside farmer that states that he knows that there is money in chickens because he put it into them and never got it out.

There are two classes that are doomed to failure. The first tries to make his place look fancy. An architect designs the house from the viewpoint of symmetry and beauty. The overhead is usually so high and the flock is usually so poor due to poor stock, poor management, poor feed, and poor sanitation that the hens cannot scratch their way out.

The second class starts with the highest degree of poor stock due to a grand mixing of varieties, breeds, and near breeds. Nature takes its course in respect to time of hatching; the house is some structure that is too poor for any other animal; the feed is a futile attempt given irregularly and results are in proportion.

Record keeping in respect to poultry is of value since the results at the end of a year will cause the owner of the flock to either improve the flock and the system to make it profitable or will cause him to drop out and make room for someone that is capable. This statement is also applicable to every other branch of farming in general practice.

A constant complaint and bewailing never improved any condition.

An average chick is not acceptable at the present time. We require machines that can develop more speed than what was capable in a 1914 model. The hatchery must make the same progress.

The cost of a house must be reasonable. It is necessary to have a house that will carry a rather uniform temperature, is dry, and is large enough to properly accommodate the flock. The lower cost at which these essentials can be obtained, the better.

A feed must be complete. It should contain the correct amount of animal protein and should be fortified both in respect to minerals and vitamins.

Management should be reasonable and regular. Variation in what is and is not done may react seriously.

A combination of a good house, a good flock, good feed, and good management will result in a profit from a flock.

Wisconsin Accredited Hatchery Meeting

At the annual meeting of the Wisconsin Accredited Hatcheries' Association at Milwaukee, Nov. 25—26, the first day was given over entirely to an instructive program. It included talks by Drs. Larson and Healy on tuberculosis eradication in poultry flocks, one on sign advertising by A. W. Hopkins, and one on national advertising by a representative of the Geyer Agency of Ohio.

The matter of forming a Wisconsin Poultry Improvement Association which would have affiliated with it all of the organizations representing the various branches of the poultry industry in the state was endorsed by the association.

Seven new hatcheries were admitted to membership, which gives the association a membership that includes practically 90 per cent of the hatching capacity in the state. Officers elected for the coming year are John Mueller, president; C. H. Mueller, vice-president, and A. G. Cory, secretary.

Wisconsin. W. F. DAMLER.

Poultry Short Course

The Eighth Annual Poultry Short Course will be held at the Wisconsin College of Agriculture at Madison from January 30 to February 3 during the regular Farm and Home Week. The course will provide instruction of value not only to farm poultry keepers but also provide for the specialist in poultry and the hatchery operators and hatchery flock owner. Programs can be secured by writing Professor J. B. Hayes, College of Agriculture, Madison, Wisconsin.

Changes in Feeding

All mash, no mash, or 50—50, it depends upon where you come from as to what system you are told to follow. There is undoubtedly merit in all or any of them.

In feeding hard grain there is some merit in the suggestion that the cleaner the feed, the better will be the health of the hen. It is probably not necessary that a hen kick a straw stack apart in order to produce eggs.

The feeling has become so accepted in respect to exercise not being requisite to heavy production, that grain feed is now hopper fed. Some feed the grain directly in the dry mash hopper. They are equipped with proper open type mash hoppers that hold an amount necessary for just one day. The grain is fed on top of the mash that remains in the evening. In fact the moist mash, the germinated oats, the cod liver oil in mash or grain or the semi-solid milk, and germinated oats are fed in this same hopper or trough.

In other instances where larger hoppers are still used, additional long, rather narrow troughs may be used for grain feeding. The grain is fed in the hoppers at night. This method permits feeding clean feed not from dirty litter and will also permit the flock its fill of grain at night in a shorter time.

Sufficient exercise will also be obtained by the natural activity of a heavy producing bird. It is no more necessary to keep a hen scratching to get eggs than it is to keep a cow running to get milk.—J. B. HAYES.

To break a cold harmlessly *and in a hurry* try a Bayer Aspirin tablet. And for headache. The action of Aspirin is very efficient, too, in cases of neuralgia, neuritis, even rheumatism and lumbago! And there's no after effect; doctors give Aspirin to children—often infants. Whenever there's pain, think of Aspirin. The genuine Bayer Aspirin has Bayer on the box and on every tablet. All druggists, with proven directions.

Physicians prescribe Bayer Aspirin; it does NOT affect the heart

Aspirin is the trade mark of Bayer Manufacture of Monoaceticacidester of Salicylicacid

Are Soy Beans Ever Poisonous?

Now and then we notice an accusation of poisonousness made against almost every common and uncommon feed of animals, and some of these allegations so scare owners of farm animals that they are afraid to use the feed accused. That is true of sweet clover. The papers have over and over again contained articles relative to the poisonous properties of this leguminous plant and we sometimes wonder if there is not a propaganda against it on the part of some interested parties who have red clover, crimson clover, and alfalfa seed for sale. The statements made against sweet clover, for example, are founded on fact, but the fact is not always explained. It is old, moldy, or otherwise damaged sweet clover *hay* that is dangerous. Prolonged, excessive feeding of such hay may so affect the blood of the animal that it fails to coagulate after an operation such as dehorning or castration; or extensive bleedings may occur, under the skin or internally, without an operation and prove fatal. Green sweet clover, used as pasture, and sound sweet clover hay is not poisonous, although it may be wise not to make the hay the exclusive roughage ration for some time prior to an operation. All damaged or moldy sweet clover hay should be discarded or made but a very small part of the roughage ration.

Now comes an accusation against the soy bean and it, too, requires explanation else a misconception of the facts may occur. A veterinarian was called to treat some cows that were mysteriously sick and found that they had been pasturing in a corn field where soy beans had been grown with the corn and put in the silage along with the corn. Some of the plants, however, ripened and the veterinarian found the woolly pods quite moldy. He wondered whether these pods might not be the cause of the sickness mentioned, for he had seen several cases of mold or cryptogamic poisoning evidenced by sore mouth (stomatitis) and sore feet, and they made him suspicious as regards the mysterious disease of the cattle that had grazed where moldy soy bean pods might be eaten. In the columns of veterinary medicine he was wisely advised by that eminent authority, Professor L. H. Pammel, of Iowa State College, that the fact that soy beans were moldy would make them unfit for feed. That, we think, is true of any feed. Moldiness would be likely to make it dangerous and all such feed should be discarded, especially for pregnant animals. Professor Pammel then added that "soy beans are more or less injurious *under certain conditions.*" He did not refer to sound soy beans, such as are cut and put into the silo along with corn, but to some soy bean meal and soy bean cake which is fed in considerable quantities abroad. He quoted a British journal as stating that Dr. Stockman's research work indicated that the whole soy bean is not poisonous and that only one special form of treatment renders the products dangerous. Professor Pammel adds: "I do not know whether any experimental study has been made of the soy plant itself in the different stages of its growth, but such a study would certainly have much interest."

In our opinion there is no cause to become afraid of soy beans or soy hay that is perfectly sound, for we have never heard of any injury resulting from its use; but there may be reason to fear some imported meal and cake.

Calf Dysentery

Last year we lost one calf at birth. This year, so far, we have lost two calves at birth. The calves are born in the usual manner and practically on time but after scouring along about three days they die. The calves seem normal but inasmuch as we have lost two out of three this year I am wondering what we had better do in the matter, fearing it might be abortion.

Could cows be tested for abortion? Can abortion be cured?

Wilmette, Ill. E. H. W.

To determine whether the cows are affected with the contagious abortion disease have a sample of each of them tested by the agglutination method at the state experiment station at Urbana. Your veterinarian can have that done. It is more likely, however, that the calves die of infectious calf dysentery, popularly called white scours or "calf cholera." The infection is born in the calf, or contracted after birth by way of the navel or mouth. There is no certain medicinal remedy, but the disease may fairly well be prevented by the following procedure: Provide a new, sanitary calving pen and similar calf pen. At birth saturate the calf's navel with tincture of iodine and then apply powdered starch or finely sifted slaked lime. Repeat the applications daily until the navel is perfectly dry. Cleanse and disinfect the cow's vagina, rear parts, udder and teats before the calf is allowed to suck for the first time. As soon as possible after birth have your veterinarian immunize each calf with anti-calf scour serum and bacterin. When the disease is prevalent we think it best to feed the new born calf the milk of a cow that has been giving milk for some time. Cleanse, disinfect, and whitewash the stable.

Mastitis

I have read the articles in your veterinary department on garget, a disease I never knew anything about. With the big demand for dairy cows in this section that has been created recently some of us have acquired some experience with that and contagious abortion. I have had an autogenous vaccine made and have a veterinarian giving the treatment. He advises me that it would not be safe to bring in any new blood on the farm but that the heifers that are to freshen next spring are not in any danger. I want to know, also, if I should sell these affected cows or will their lost quarters give milk when they freshen again? We are keeping the barn clean and well limed but the cows have access to pond water.

Clinton, Miss. W. E. P.

Chronic mastitis is incurable and the infection may be carried from cow

Calf Scours

Abortion

Retained After Birth

CALF SCOURS is easily prevented and controlled by disinfecting new-born calves with dilution of B-K, and feeding them a little B-K. Get our book on Scours.

For removing **Retained Afterbirth** B-K in warm water loosens adhesions, stops inflammation, prevents fever and odors. The afterbirth comes away naturally; the parts are restored to health.

Abortion is caused by germs of several kinds. What they are and what can be done in prevention and control is told in our book.

B-K is Concentrated

you add water to use, the dilution costs

Only ½ to 2c a Gallon

The germ destroying power of B-K is 10 times greater than that of undiluted carbolic acid. B-K destroys germs by chemically dissolving them, yet B-K contains no poison, or acid, and leaves no odor.

B-K represents 15 years of scientific work. It is made by our exclusive process, producing the only stabilized hypochlorite ever approved by the American Medical Association.

B-K is dependable. Your money back if not satisfied.

SPROUTED OATS — FOR — STERILE COWS

Extensive experiments the past two years have demonstrated that sterility in cows may be overcome simply by feeding a ration of SPROUTED OATS such as produced in Grain Sprouters for poultry. Sterility often caused by functional disorders and a correct dietary overcomes this barrenness. Vitamin E has been found to have a powerful effect on the reproductive organs of animals and this fifth Vitamin is found in bountiful quantities in properly sprouted oats. to cow by the milker's hands. Three-teated cows are a menace on account of the possibility of infection. They should be fitted for the butcher on that account and also for the reason that the function of the lost quarter will not be restored at a subsequent calving. The herd autogenous bacterin may protect unaffected heifers and cows from the disease, but it will also be necessary to cleanse, disinfect, and whitewash the stable including floors and gutters. Also cleanse and disinfect the teats of all cows before and after milking and milk with clean hands. If any valuable pedigreed three-teated cow must be retained for breeding keep her isolated and let her nurse her calves. Keep the cows out of ponds.

Abortion Infection

We have bought ten Holstein heifers and understand that out of ten cows in the herd this spring five of them lost their calves from two to seven months. There had been no sign before except two years before two cows lost premature calves. We have good, clean quarters and want to know what precaution we can take to insure good, healthy calves.

Stratford, Tex. C. F. M.

Quarantine the bought heifers and have a sample of blood from each of them tested for abortion disease infection. Your veterinarian probably can have the testing done by the experts of the veterinary department of the state experiment station at College Station. If the heifers react it would be best to maintain them as a separate herd. Although they react they may not abort, but there is nothing certain as to that, nor is there any certain way of preventing abortion from occurring. Study a bulletin on abortion which you can obtain from the U. S. Department of Agriculture, Washington, D. C.

Control of Sex

I would appreciate a little advice. I have a herd of registered and pure-bred Jerseys and I seldom have a heifer calf. I have been advised to buy an old bull so that I would have heifer calves. Do you think there is any way to breed for heifer calves?

Crossville, Ill. E. B.

No certain way has been discovered of controlling sex. Nature balances her books in her own mysterious way. In time your cows will be likely to give birth to heifer calves if they are now delivering males, but there is no certain way of making them do so.

Frosted Forage

Is frosted or frozen sweet clover or alfalfa poisonous when eaten by cows? We have a field of biennial sweet clover which is about 8 inches high and of course it has been frozen and we wish to pasture our cows on it.

Ft. Madison, Ia. A. E. W.

Such frosted feed is at least dangerous for pregnant cows as it possibly may induce abortion, especially when cows are affected with abortion diseases. It may also cause any farm animal to bloat or scour. Moldy sweet clover is most dangerous as it affects the blood so that it does not coagulate normally or may cause extensive bleedings into the tissues. Cattle that have been living on moldy or otherwise damaged sweet clover hay are likely to bleed to death following castration or dehorning. We cannot, therefore, advise you to let your cattle graze frozen sweet clover.

Supernumerary Teat

Would like your opinion in regard to a heifer that has an extra teat between the two teats on the right side. If the teat is removed is it likely that the quarter will develop and secrete milk?

Springfield, Mo. J. T. M.

Have the supernumerary or rudimentary teat amputated by a veterinarian who will, at the same time, obliterate the milk duct by cauterization, so that the small mammary gland at the base of the extra teat will not function when the heifer calves.

BROWN SWISS

Brown Swiss Bulls Mark Imprint on Grade Herds

Extra large production in a herd of grade cows may be gained by breeding with a Brown Swiss bull. They sire strong calves of a uniform type, well adapted for the general dairy farm. Mature bulls weigh between 1,800 and 2,500 lbs.

We will be glad to help you secure a Brown Swiss bull and, if you desire, a heifer or a cow.

born October 12, 1926; broken color. Sired by Sophie's St. Mawes Victor, a well bred bull. His dam is by the Silver Medal bull, Sophie's Emblem, and has a R. of M. record of 646 lbs. fat. He is a very typy animal and is well backed by good records. Price $150.00 crated f. o. b. Cleveland.

K. T. WIEGAND, Cleveland, Wisconsin

Profit Begins Where Cost Ends

The cost of feed is the greatest item of expense in producing milk. If high production can be secured at a low feed cost profits will be very satisfactory.

The Jersey cow gives the highest yield PER POUND OF FEED CONSUMED. This means greater NET profits which is what you are interested in.

Write NOW for free illustrated booklets on the Jersey cow.

THE AMERICAN JERSEY CATTLE CLUB, Dept. B
324 West 23d St., NEW YORK, N. Y.

Christmas Greeting == The Oaklands Jerseys

NO JERSEY HERD IN ALL HISTORY has ever submitted to so extensive and fastidious a show-yard test as that just completed by The Oaklands Jerseys for the 1927 season. The Mississippi Valley and Great Lakes territory practically covered in a four-months' tour of exhibits at fourteen important fairs and exhibitions in ten different States and Canada. Including such classic competitions as the National Dairy Show, the Dairy Cattle Congress, the Canadian Royal, and nine State fairs. Assembling the tops of America's crack show herds. Our Jerseys fared well, with more than three hundred prizes taken, nearly forty per cent. Championships and First Prizes. The primary object, however, was to show to the public the improved type of economic producers maintained in The Oaklands breeding herd of more than Two Hundred Island-Blood Jerseys.

Selections of Jersey seed-stock from this high-producing successful breeding establishment will raise the average quality of most herds and reduce the standard of none in the world.

Jersey Bull Calves

We are offering at reasonable prices a few bull calves sired by Vive La France's Darling Son and out of cows of rich Sophie's Tormentor breeding. Vive La France's Darling Son is out of Vive La France, the first cow to make over 1000 lbs. fat and the cow whose average of 890 lbs. butterfat for first 6 lactation periods exceeds that of any other dairy cow. He is sired by Darling's Gallant Boy, the silver medal sire and full brother to Darling Jolly Lassie, 1141 lbs. fat as Jr. four-year-old. Two of these bull calves are out of granddaughters of Sophie's Agnes, the first Jersey cow to make 1000 lbs. butterfat.

THE GOLDEN GLOW JERSEY FARM KENSINGTON, M

Great Bulls

"Not since the days of Sitting Bull have I seen his equal"

said Chief Little Bear to Manager E. S. Estel as they looked over Cavalier's Ping Pong, champion of the Dairy Cattle Congress.

As a matter of fact, since long before the days of the famous fighting Sioux great Ayrshire bulls have been improving the herds of thousands of farmers by siring deep-bodied, square-uddered cows that fill the pails with 4% milk.

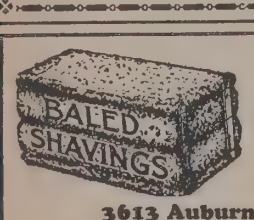
How Testing Built a Good Herd

(Continued from page 1186)

cows as their condition and production indicate its need. He has native pastures and he has about come to the conclusion that the use of the tester and scale is going to make it necessary to get better pasture. About the only weak place we can see in his whole management is pasture.

With nearly 10,000 bushels of grain to dispose of each year, Mr. Anderson finds it profitable to use some of it to grow 100 hogs each year, marketing them at 225 to 250 lbs. weight. The hogs get the advantage of alfalfa pasture. They are finished out on corn, oats, and skimmilk. Thus if the value of the skimmilk marketed in this way were credited to the cow, their income above feed cost would look like $175 to $200 per cow, charging each cow from $100 to $125 for feed.

With three men to feed and a house to look after, it seems that Mrs. Anderson would have plenty to keep her busy but besides growing flowers in her garden, she is the boss of the poultry. We asked her if she thought she could persuade some of her chickens to leave their shade a minute or so until we snapped a picture. She thought she could. Armed with an old tin pail containing some scratch grain, she beat a tattoo on the pail with a stick at the same time calling in that well known but variable chicken language easily recognized by a bunch of well trained and hungry chickens. Out they came from everywhere—dozens of them—all sizes and several varieties. They were not disappointed though they may have wondered, "why feed us at this time of day?" When we were there the flock numbered about 600.



Some farmers spend a part of their earnings to buy more land than they need,—others buy oil stock. The Andersons have bought only one farm. They have spent part of their earnings, of course, for the farm but they have not denied themselves labor saving equipment that makes farm life in many respects on a par with if not superior to city life.

They installed the first electric lighting and power plant that came into their community. They have used a milking machine for fifteen years. With power from this plant they light their home and other buildings, run the milking machine, separator, washing machine, flatiron, fanning mill, and grindstone. They pump water with a windmill. They have a furnace, telephone, automobile, light truck, and tractor with complete field equipment for it.

Some farmers say that the only way to get ahead in dairying is to have a large family and work the children without pay. The Andersons disprove this theory because they have only one boy, Lewis, 18 years old and they are not denying him an education.

Mr. Anderson is a director of the Lily Creamery Company, a co-operative, a member of the Land O' Lakes Creameries Incorporated. He served as its president for two years. At the Lake Crystal Fourth of July celebration in 1925 a float representing this creamery won first place. Mrs. Anderson was one of a committee of six women who decorated the float and took part as a passenger of the float in the parade.

The Andersons could never have accomplished as much as they have if they had not sent boarder cows to the butcher.

(Continued from page 1187)

agree to supply one-half of the total consuming needs of the home population.

Why Sugar is High in Australia

The bonus plan is carried to the limit in the matter of sugar cane culture. In the more tropical sections, as Eastern and Northern Queensland, sugar cane can be readily grown. Originally, this crop was produced mainly by "Kanaka" labor imported from the South Sea Islands, but since the federation of the Commonwealth, colored labor of any type has been rigidly excluded. At the present time Australia is the only country in the world that is trying to grow sugar from cane exclusively by white labor. Cane field labor gets from $2.70 to $3.10 a day for eight hours' work and extra pay for overtime. Cane cutters in the more northerly hot sections are awarded a government wage scale that amounts to $3.70 to $4.00 a day. Under these conditions it is not at all surprising that the labor costs alone represent 70% of the entire cost of sugar production.

For the last three years there has been an embargo against the importation of any foreign sugar, so that domestic consumption would first utilize the home grown product, but in spite of this restriction, under the stimulus of an export bounty of $30 a long ton (1.4 cents per pound), exports have now risen to 40% of the entire crop. Great Caesar grows by that on which he feeds.

Last year the entire Australian population had to bear a tax of nearly $3,000,000 in subsidies and bounties for export of products, an increase of threefold over the previous year to pay for the privilege of shipping its surplus products into the world's markets.

Java Utilizes Science to Lower Its Costs

Compare this artificially stimulated economic situation with what is found in Java, the neighboring island of the Dutch East Indian empire on the North and West. In that tropical isle the white man supervises but the brown native does the work. But in no country in the world is there a closer application of science. With favorable soil and climatic conditions, a teeming population on an exceedingly low wage scale of 15 to 25 cents a day, and the widest possible application of modern science, the Dutch have been able to lead the world in the average yield of sugar grown per acre. Compare the average of Java sugar yields for 1924 at 10,360 pounds per acre with 4,550 pounds which is Australia's average yield, and it is obvious why it is necessary for Australia to grant an export bounty that is nearly three-fourths of the cost of growing sugar in the Indian Isle.

Without such artificial aid her growers would be hopelessly outclassed in the open markets of the world. But who pays for all this? What doth it advantage a nation to produce a product in excess of its own needs when every pound is made at such a tremendous cost? Simply because this burden is spread over the entire population in the form of taxes its weight is no less.

In these days no man (or country) can live wholly unto himself alone. The world has grown too small. But as the world shrinks, does our vision widen?

No man's a model husband when hungry.

C. W. Clingan, Field Sec., Box 225H, Ft. Atkinson, Wis.

Could You Use A Mature Bull That We Guarantee?

A bull that would have cost you from $750 to $1500 as a calf can be purchased today for $250 to $350.

Furthermore, we can tell you that this bull has had nice calves, the sort that are desirable.

As a matter of fact we have two such bulls. These bulls are of the very best of breeding and

WE GUARANTEE THEY ARE BREEDERS AND FREE FROM DISEASE.

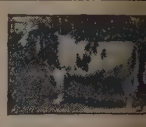
One is sired by Matador Segis Walker.

One is sired by Burton Hartog De Kol Ormsby.

One is from a 30 pound daughter of a 1000 pound cow, and the dam's sire is from a 1400 pound butter producer.

The other is from a 1000 pound daughter of Avon Pontiac Echo, who in turn is from a 1000 pound daughter of King Segis 10th.

The Burton bull is 4 years old. The Matador bull is 6 years old. We've bought them back from the small herds in which they were used. Both are in rough condition and we will sell them for just what we paid for them, namely $250 and $350, so someone can get the use of them.



You can't lose for we guarantee them breeders, and if they prove otherwise we will replace them immediately with bulls of equal value without expense to the buyer. They are easy to handle and really worth much more than the price we are asking for them. You'd be safe to order by telephone.

Write today for pedigree of bull calf ear tag No. 306.

SERRADELLA FARM, (Federal Accredited Herd) Oscoda, Mich.

HOLSTEINS FOR PROFIT

HEAVY PRODUCTION IS PROFITABLE PRODUCTION

The U. S. Department of Agriculture found from the study of 100,000 individual cow records, that the cost of feed for cows producing 9,000 lbs. of milk in a year was only 40% more than for cows producing but 4,500 lbs. of milk in a year.

During the past year 897 cows and heifers in Michigan State Herds averaged 10,906 lbs. each. They are bred for heavy production.

Increase the production of your herd by using a sire bred by Michigan State Herds. Bull calves and service bulls at reasonable prices.
